Fishburn, Oldham, Tate, Dryden, Shadwell, D'Urfey, Brady, Congreve, Hughes, and others contributed texts, and the composers included Henry Purcell (1683 and 1692), Blow (1684, 1691, 1695, 1700), Draghi (1687), Finger (1693), Daniel Purcell (1694 and 1698), Clarke (1697) and John Eccles (1701). The odes were performed by leading singers of the day, with a chorus drawn from the choirs of St Paul's Cathedral, Westminster Abbey and the Chapel Royal, and instrumentalists from the King's Band and the theatres. Most texts conform to a common pattern: a conventional opening section praising Cecilia; a contrasting section, often using military imagery to express the chaos preceding the advent of 'heavenly harmony'; and a final section lauding the qualities of individual instruments. The most distinguished texts are Dryden's *From Harmony* (1687, music by Draghi) and *Alexander's Feast* (1697, music by Clarke).

In musical organization and style, the Cecilian odes are similar to the court ones: songs, duets and trios setting descriptive passages, with choruses for the laudatory sections. Draghi's fine setting of Dryden's *From Harmony* did much to expand the expressive range of the Cecilian ode, exploiting the imagery of the text in both the melodic writing and the instrumental accompaniment. His ode undoubtedly influenced Purcell's *Hail! Bright Cecilia* (1692) which, with its unusual formal coherence and consistently high musical quality, was the finest work to emerge from the annual festival. The London feasts inspired numerous provincial concerts on St Cecilia's Day, and newly composed odes were given in Oxford (Daniel Purcell), Hereford (Henry Hall), Winchester (Vaughan Richardson) and elsewhere in England.

During the 18th century regular observance of St Cecilia's Day declined, but the *encomium musicae* continued to provide inspiration for poets, either in the traditional form of an ode in honour of the patron saint (Pope, Lockman) or as a more general ode in praise of music or harmony (Warton, Pye). In this latter form the 'ode to music' retained some popularity with composers. Pope's Cecilian ode was set by Greene, in a modified version, as his Cambridge doctoral exercise in 1730 and later, in its original form, as an Oxford BMus exercise by William Walond. William Boyce wrote a short ode for St Cecilia's Day about 1738 as well as his fine extended setting of John Lockman's *See famed Apollo and the nine* (1739). The poems written by Dryden for the feasts of 1687 and 1697 were set by Handel in 1739 and 1736 respectively (the former having its first performance on 22 November), and towards the end of the 18th century Samuel Wesley made an extended setting of a Cecilian ode by his grandfather that both William Norris and Daniel Purcell had set over a century earlier. Less substantial works in the Cecilian tradition by Pepusch, Alcock, Festing and the Hayeses are extant.

(iv) Odes for academic ceremonial. A separate tradition of ode writing developed at the University of Oxford; in its earliest manifestation, Latin songs performed to accompany the annual academic ceremony known as the Act (*see* ACT MUSIC (ii), it probably predates the court ode. At Cambridge ode performances were much rarer. By 1730, when Gibbs's Senate House was opened, the distinction between different types of ode and their functions was increasingly blurred, a fact underlined by the performance of Greene's doctoral St Cecilia ode as part of the celebrations for the new building. The only odes subsequently composed for Cambridge were Boyce's setting of a text by William Mason for the installation of a new Chancellor in 1749, and John Randall's installation ode of 1769 (now lost), with words by Thomas Gray. In Dublin an early example of an ode for an academic occasion is Purcell's *Great parent, hail* (words by Tate), performed at Christ Church Cathedral in 1694 to celebrate the Trinity College centenary. The Earl of Mornington's ode for the new Chancellor of the university in 1768 appears to have been the only other example.

(v) Other aspects of the 18th-century ode. Court odes inspired similar works in celebration of prominent figures and events of national significance, including Jeremiah Clarke's ode celebrating the victories of the Duke of Marlborough and his so-called 'Barbadoes Song' commemorating a hurricane in the West Indies. Performances for charitable causes formed another strand of the ode tradition (e.g. Boyce's *Ode to Charity*, 1774, and Arne's ode for the Middlesex Hospital, 1775). Other odes for the inauguration of new buildings included those by James Hook (1772) and Samuel Arnold (1785).

Changes in literary taste had a significant influence on the ode as a musical form. Boyce's *Ode in Commemoration of Shakespeare* (first performed 1756) and Arne's setting of words by Richard Garrick for the so-called Shakespeare Jubilee of 1769 reflect the mid-century revival of interest in the Bard. There was a further Shakespeare ode from Samuel Arnold (given at Marylebone Gardens in 1769), but the most striking work of this sort was Thomas Linley's *A Lyric Ode on the Fairies, Aerial Beings, and Witches of Shakespeare*, performed at Drury Lane in 1776. The text, by French Lawrence, reflects the rising romantic mood in English poetry, and Linley responded with fine music to produce one of the most important later examples of the genre.

Other poets influenced by the romantic movement (Gray, William Collins) increasingly wrote lengthy odes that lacked any occasional or topical significance but retained the characteristically rich language and imagery of the form. Such poems attracted many composers, an early example being William Hayes, whose setting of Collins's *The Passions* was first performed in 1750, but it was composers of the next generation (Philip Hayes, William Jackson, Benjamin Cooke and John Wall Callcott) who established a tradition of 'abstract' odes. These are among the most substantial in the ode repertory, with overtures in several movements, extended self-contained vocal sections, elaborate fugal choruses and large-scale accompaniments. Few can be considered *in toto* as musically outstanding, but they frequently demonstrate the composers' imaginative response to the libretto, expressed in vivid word-setting and unusual orchestration.

During the 18th century the term 'ode' came to be applied to a wide variety of works, ranging from strophic songs for solo voice, through works that are in effect cantatas, to settings on the scale of a small oratorio. The development of the public concert towards the end of the 17th century helped to sustain the ode's development and ensured that many occasional pieces first heard in a setting appropriate to the event were repeated in the concert room, the theatre or the pleasure garden. Of the more than 500 odes known to have been composed between 1660 and 1800 well over half have survived in some form.

4. 19TH AND 20TH CENTURIES. The ode hardly lends itself to precise definition as a musical genre in the 19th and 20th centuries. That is partly because poets themselves have not always been discriminating in their use of the term (there is no obvious reason, for example, why Keats's *To a Nightingale* should be called an ode while Shelley's *To a Skylark* is not), and also because during that period there was no unbroken tradition like that of the English court ode. Such late 18th-century publications as *Sei ode di Oratio tradotta in lingua italiana* (London, *c*1775), including settings by J.C. Bach and Antonio Boroni, and *Odes d'Anacréon, ... avec ... odes grecques mises en musique par Gossec, Méhul, Le Sueur et Cherubini* (Paris, 1798) seem to have been isolated examples of the classical revival. Many of the poems originally entitled odes in the 19th and 20th centuries were not so called when set to music, and vice versa. The best known of all musical odes, Beethoven's setting of Schiller's *An die Freude* in the finale of the Ninth Symphony, was not called an ode by Schiller, and although the title-page of the symphony reads *Sinfonie mit Schluss-Chor über Schillers Ode 'An die Freude'*, Beethoven elsewhere referred to the poem in other terms. The settings (in translation) by Tchaikovsky (1864) and Mascagni (1882) are usually called cantatas.

Indeed, there is little to be gained by attempting to separate the ode from the cantata as a musical form in the 19th and 20th centuries; both might be described as substantial works for chorus and orchestra (often with solo voices) on a secular and usually elevated theme. (Brahms's setting of Hans Schmidt's *Sapphische Ode*, like other short odes for voice and piano, belongs to a different genre.) Odes, like cantatas, were frequently written for ceremonial occasions (e.g. Sterndale Bennett's setting of Tennyson's *Ode Written Expressly for the Opening of the Industrial Exhibition*, 1862, and Sullivan's setting of Lewis Morris's *Imperial Institute Ode*, 1887), and the tradition of celebrating the feast of St Cecilia with a specially composed ode was carried on intermittently. Among the many odes of Hubert Parry was a setting of the same *Ode on St Cecilia's Day* by Pope that Maurice Greene and William Walond set in the 18th century. Among the best 20th-century Cecilian odes is Gerald Finzi's *For St Cecilia*, composed to words by Edmund Blunden for the St Cecilia's Day Festival in London in 1947. Britten's unaccompanied *Hymn to St Cecilia* on a text by Auden, though not an ode in title, comes into the same category.

Works such as these were clearly related to the ancient classical odes of Horace and Pindar in so far as the poems they use were expressly written for musical setting. The majority of odes composed during the 19th and 20th centuries, however, were settings of verses not originally intended to be sung. A glance through the works of the major European composers of this period reveals surprisingly few odes (Bizet's *Vasco de Gama* (1859–60) and Debussy's unfinished *Ode à la France* (1916–17) are rather isolated examples), but the poetic form was much cultivated by the English Romantics, and many of their greatest odes attracted composers. Keats's famous *Ode to a Nightingale* was set by Hamilton Harty, Ernest Walker and Richard Walthew, for example, and Holst used the same poet's *Ode on a Grecian Urn* for the slow movement of his Choral Symphony (1923–4). Byron's *Ode to Napoleon* was set for reciter and instruments by Schoenberg in 1942, and Finzi's ambitious setting of Wordsworth's *Ode on the Intimations of Immortality* was written for the Three Choirs Festival at Gloucester in 1950. Finzi omitted two of Wordsworth's stanzas, but his ode is nevertheless one of the longest ever composed. Among later poems must be mentioned the verses of Walt Whitman that were used by Stanford for his *Elegiac Ode* (1884) and by Holst for his *Ode to Death* (1919). Robert Bridges commemorated the bicentenary of Purcell's death in 1895 with an *Ode to Music*, which Parry set in that year as *Invocation to Music*; his own *Ode to Music* (1901) is to words by A.C. Benson. Holst also drew upon Bridges's poem for part of his Choral Fantasia (1930). The ode was not much cultivated after World War II,

perhaps because of its past associations with rather high-flown poetic sentiments and with a tradition of choral writing that many have considered stuffy and outworn.

Odell. American firm of organ builders. It was founded (as J.H. & C.S. Odell) in 1859 by John Henry Odell (1830–99) and Caleb Sherwood Odell (1827–93) in New York. Before starting their own company, the Odell brothers had worked for Richard Ferris, and for William Robjohn, whom they succeeded. Although the firm's output was never great and was largely confined to the New York area, the Odells are credited with several important inventions, mostly patented during the 1860s and 1870s, including a reversible coupler action, an early combination action and a crescendo pedal. They were also early experimenters with tubular-pneumatic action, for which they obtained patents in 1872 and 1898. Among their more notable instruments were those built for the Fort Street Presbyterian Church, Detroit (1876), and Fifth Avenue Presbyterian Church, New York (1893). After the deaths of the founders, the firm was operated for a time by John Henry's son, George Washington Odell, under the name of J.H. & C.S. Odell & Co., and the scope of the company's work gradually narrowed to small organs, rebuilding and maintenance. William Henry Odell, son of Caleb, later operated the company with his sons Caleb H. (*d* 1944) and Lewis C. (*d* 1959); in 1928 the sons relocated the workshop to Mount Vernon, New York. After their deaths the company was run as a maintenance operation by Harry Odell (1919–98, son of Caleb H. Odell), who sold its assets to Anthony R. Meloni & Co. of Portchester, New York, in 1985.

BARBARA OWEN

Odense. City in Denmark, the country's third largest city, on the island of Fyn. In early times music was taught at the Latinskole, and a town musician was employed. As the city was the winter residence of the landed gentry, a rich theatrical and musical life developed from the end of the 18th century. Visiting opera companies appeared at the Odense Teater (erected 1795, rebuilt 1840 and 1891; new building 1914); concerts were also held at the inn of Herman Kyhn (from the winter season of 1772) and later in the Odense Klub (founded 1780, closed 1801). Passion concerts with oratorios were conducted by the choirmaster of the Latinskole, Johan Jacob Heimeran. From 1813 to 1818 Count Frederik Ahlefeldt-Laurvig's orchestra formed the nucleus of concert life. In 1819 the Musikalske Selskab (Musical Society) was formed, holding subscription concerts in the town hall. The Odense Musikforening (Music Society), founded in 1866, was active over a long period and among other things performed oratorio. In 1880 a 20-man regimental orchestra was established, continuing until 1932 and later continued until 1997 in the Musikkorps Fyn (earlier the Fynske Livregiments Musikkorps). In 1918 the Odense Private Kammermusikforening (from 1920 the Odense Kammermusikforening) was set up. Several attempts were made to establish a permanent city orchestra (e.g. the Filharmonisk Orkester for Fyns Stift, founded 1926); finally in 1946 the Odense Municipal Orchestra (Byorkester) was founded (from 1986 the Odense Symfoniorkester). It performed in the Fyns Forsamlingshus (built 1910; *c*1700 seats) and later in the Odense Koncerthus (inaugurated 1982), which has two halls seating 1300 and 360; the large hall houses an organ by Marcussen with 46 stops. In 1929 the Fynske Musikkonservatorium was established; it has been a national institution since 1972. Fyns Unge Tonekunstnerselskab has performed new music since 1982, for example

at the Musiknytår and Musikhøst festivals. Other ensembles are the Carl Nielsen Kvartetten (formed 1963; known as Fynske Kvartet, 1963–73) and the Fynske Trio (founded 1973; from 1990 called the Lin Ensemble). Opera and operetta were performed occasionally at the Odense Teater, more regularly from 1948. Fynske Opera, founded in 1953, staged a new production annually at the Odense Teater until it disbanded in 1964.

The composer Carl Nielsen was born near Nørre Lyndelse, south of Odense, in 1865 and as a young man worked in the city as a military musician. There is a museum in Odense honouring Nielsen and his wife, a sculptor, and a smaller one at one of his childhood homes, south of the city. In 1982 the first known manuscript of a symphony attributed to Mozart (K16*a*) was found in Odense; it had its modern première there in 1984 and, although the attribution is discredited, is now known as the Odense Symphony.

CLAUS RØLLUM-LARSEN

Odeon. German record company. Odeon was a trademark of the International Talking Machine Co., founded by Frederick Prescott in Berlin in 1903. In 1911 it was acquired by the German Carl Lindström company, which in turn was bought by Columbia International in 1926. In 1931, after the merger of Columbia and the Gramophone Company, Odeon became part of Electric and Musical Industries (EMI). EMI issued records on a variety of labels, but Odeon remained the main label of the German branch, and even after the merger it operated quite independently. After World War II it took a less prominent role, but EMI was still using the name as a trademark in 2000.

Odeon had international ambitions from the start. By 1906, the company claimed to have made 14,000 different recordings in various parts of the world. The recordings were originally made by engineers sent out from Berlin and pressed in Germany for subsequent export to the country of origin, but later additional factories were established in major markets. In Europe, Odeon had a large popular and classical repertory, with Lilli Lehmann, Emmy Destinn and John McCormack among its artists; in north Africa and Asia it recorded a large number of local artists.

During the 1920s and 30s Odeon was the flagship label of the Lindström company, its prominent artists including Lotte Lehmann, Richard Tauber, Bronisław Huberman, Gregor Piatigorsky, Hermann Abendroth, Hans Knappertsbusch, Otto Klemperer and Willem Mengelberg. The label was well known in most parts of the world, except the UK and North America. In the USA, European Odeon recordings usually appeared on the Columbia and OKeh labels, although a number of releases mainly aimed at the immigrant market appeared on the original label. The Lindström company had an extensive network of local branches and agents in continental Europe and Latin America, including such minor markets as Latvia and Albania. It was also established in most Asian countries, and was among the first record companies to exploit systematically the emerging African record market. It was the company's practice to assign separate catalogue number series for each country.

The total number of Odeon records issued is not known; probably many have been lost. Surviving examples show that in addition to its repertory of classical and popular Western music, the company made an extraordinary number of recordings of the various musical idioms of the world. Its anthology Music of the Orient, compiled from the company's repertory by the musicologist Erich von Hornbostel and issued in an album of 78 r.p.m. records in Germany and the UK during the 1930s, probably represented the first attempt to present in-context recordings of non-Western traditional music to Western audiences.

PEKKA GRONOW

Odessa. The fourth largest Ukrainian city, it is strategically located at the mouths of the Danube, Dnester, Boh and Dnepr rivers. In 1480 the Odessa territory was captured by Turks, who built a fortress on it. During the Russo-Turkish War (1789), the Russian army and the Zaporozhian Cossacks took the fortress and the settlements, and in 1792 the territory was transferred to Russia under the terms of the treaty of Iaşi. In 1795 it was renamed, from the Turkish Hadzhybei, Odessa. Catherine II decided to develop the town into a large naval and commercial port and trade centre, and, because of its position as 'the southern window to Europe', the city grew rapidly in the second half of the 19th century, soon becoming the major cultural centre of southern Ukraine. Although the dominant language and culture was Russian, a sizeable German and Jewish minority (as well as Greek, Turkish, French and Italian) developed their own distinct cultural forms.

Odessa soon became an important musical centre: the opera house was built in 1810 and the Philharmonic Society was formed in 1839. Italian music was in vogue; Italian opera flourished and the only professional music activity in the city was operatic until in 1831 A.D. Zhilin organized instrumental concerts. It was fashionable at that time to have mixed vocal-instrumental concerts presenting a number of artists on the same evening. This changed with Franz Liszt's first tour of Odessa in 1847, which consisted of six solo concerts. Liszt was followed in 1848 by Henry Vieuxtemps, and in 1852 by A.F. Servais, and Henryk and Józef Wieniawski. Other famous violinists such as Alexander Artôt, Lipiński, Joseph Mayseder and C.-A. de Bériot also visited the city.

Official music instruction began in 1848 with the violin studio of L. Gold. Following reorganizations (first in 1866, then again in 1886), a school was set up in 1897 by the Russian Music Society and on this base the Odessa Conservatory was founded, in 1913. Violin instruction in Odessa became famous for attracting and producing world-class performers: Misha Elman (who studied with A. Fiedemann, 1897–1902), Nathan Milstein and David Oistrakh (who studied with Pyotr Stolyarsky) are just three examples. The conservatory was divided in 1923 into the Odessa Institute of Music and Odessa Music Tekhnikum. In 1928 the schools were combined as the Beethoven Music and Drama Institute. In 1934 the Odessa Conservatory was re-established. Its current name is the A.V. Nezhdanova Odessa State Conservatory. The Conservatory produced many virtuosos, among them Mikhail Goldstein and Emil Gilels. Odessa has also been home to notable composers. In 1858 P.P. Sokal′s′ky settled there, pursuing his activities as composer, critic, ethnographer and music promoter until his death in 1887. In the early years of Soviet Ukraine Mykola Vilinsky and Volodymyr Femelidi achieved prominence, to be succeeded by Konstantin Dankevych (1905–84). Today the principal names are Karmela Tsepkolenko, who also runs a festival in Odessa, and Y. Znatokov (*b* 1926).

The core of Odessa's musical life, and one of the most important musical centres of the tsarist empire, was opera: such composer-conductors as Tchaikovsky, Rubinstein, Rimsky-Korsakov, Nápravník, Arensky and Glazunov, and singers such as Chaliapin, Krusceniski, Sobinov, Caruso, Battistini, Anselmi and Titta Ruffo graced the stage there. The Odessa Russian Opera was founded in 1809. In its early years the theatre featured drama and opera productions, ballets and vaudevilles, in which Russian, Italian and French companies appeared. In 1873 the theatre burnt to the ground; the Viennese architects Fellner and Helmer built a new one between 1884 and 1887. In 1925 fire again damaged the theatre, and the following year it was reopened as the Odes′ky Akademichny Teatr Opery ta Baletu (Odessa Academic Theatre of Opera and Ballet). The next serious reconstruction took place in 1965–7. The Odessa Opera played a major role in the development of Ukrainian opera: two of Lysenko's works received their premières there, *The Drowned Maiden* (1885) and *Natalka Poltavka* (1889). After the reorganization in 1926, when the company became Ukrainian, it began to produce a number of Ukrainian operas, notably *The Break* by Volodymyr Femelidi (1929), *The Golden Ring* by Lyatoshyns′ky (1930), Verykivsky's *The Ensign* (1938) and *Taras Bulba* by Lysenko (1971). During the late 1920s and early 30s, until the advent of socialist realism, productions were often experimental, borrowing as much from cinema as from the theatrical avant garde.

The New Philharmonic, which includes a symphony orchestra, was founded in 1936 and has performed with many notable conductors, including Natan Rakhlin, Yury Temirkanov and Kurt Sanderling. In 1993 the Odessa Philharmonic became the first orchestra from any city in the former USSR, other than Moscow or St Petersburg, to travel to the USA. In 1992 the Venezuelan-American Hobart Earle became its music director.

His treatise on music, the *Summa de speculatione musice*, is the most systematic and comprehensive English work of its period. It exists in a complete version, *GB-Ccc* 410, and a recently discovered major fragment, *Lbl* Add.56486(A). The *Summa* was a significant source for later English theory including the *Regule* of Robert de Handlo, the *Breviarium* of Willelmus and the *Quatuor principalia* of John of Tewkesbury, and it continued to be copied into the 15th century. Odington further explored the Quadrivium in treatises on arithmetic, geometry and astronomy. His alchemical treatise, the *Ycocedron*, seems to have been the most widely disseminated of his works.

The scarcity of direct biographical evidence has led to misattribution and misdating of Odington's work. Bishop Bale, writing in 1557, assigned the scientific works to 'Odingtonus', whom he dated *c*1280, and the musical treatise to 'Gualterus de Evesham', dated *c*1240. As a result, Burney, Fétis, Coussemaker and Eitner variously placed the *Summa* between 1217 and 1240. A 'Walter de Evesham' documented between *c*1331 and 1346 as a Fellow of Merton College, Oxford, has also been wrongly identified with Odington. (It is possible, however, that he may have been the author of the works ascribed to 'Walter Evesham'.) On the evidence of Odington's own words we know that he was a monk of Evesham, a Benedictine abbey near Worcester. In the minutes of a Benedictine chapter general in 1298 he is named as a member of a committee for the administration of Gloucester College, a Benedictine college at Oxford for monks of the Canterbury province. It may have been here that 'Walter Evesham ... made his deliberations at Oxford *c*1316AD', as William of Worcester noted in 1463.

The *Summa de speculatione musice*, as its title suggests, is a comprehensive work, logically organized and firmly based upon recognized authorities. As a work of 'speculation' upon music it treats the mathematical bases of the art as prerequisites for the exposition of practical music. Like Hieronymus de Moravia, whose compilation resembles Odington's treatise in scope, Odington drew freely on the standard medieval sources: Boethius (*De institutione arithmetica*, *De institutione musica*), Isidore of Seville (*Etymologiarum*) and Cassiodorus. Of more recent writers, Adelard of Bath and Ibn Sīnā are cited, and an important passage seems to derive from the earlier 13th-century Johannes de Garlandia, perhaps through Hieronymus de Moravia. Unlike Hieronymus, Odington assimilated his borrowings into the logical framework of the *Summa*.

Part i of the treatise deals with arithmetic, the study of numbers in itself. Following Boethius's *Arithmetica*, it explains the possible relationships between unequal numbers (multiple, superparticular, superpartient) and the possible means between numbers (arithmetic, geometric and harmonic). Part ii, based on the *Musica* of Boethius, considers music as understood in the classical sense of number related to sound, or what we would term harmonics. Intervals, consonances and the comma are considered in terms of their mathematical demonstration. In the course of this discussion it is observed that the major and minor 3rds, since they approach the ratios of

5:4 and 6:5, are sometimes considered consonances, and are in performance altered to mathematically perfect consonances.

Part iii, 'On the construction of musical instruments', is not a handbook for the craftsman but a demonstration of the harmonic relationships presented in the previous chapter in the proportions of the monochord, organ pipes and bells. Part iv, based on Isidore's discussion of poetic metres, employs the same numerical relations outlined in the first part to enumerate the proportional relationships between the two parts of a metrical foot.

While these four sections of the treatise serve the *musicus* or theorist, the last two chapters are designed for the practising musician, and their models are closer to hand. Part v is a chant treatise and tonary – a genre stretching from Aurelian of Réôme through Guido to the *Lucidarium* of Marchetto da Padova. There are tables of notes and ligatures and an explanation of the hexachord system. The tonary, apparently derived from the Sarum *Tonale*, which forms the bulk of the chapter, describes and illustrates each of the eight ecclesiastical modes.

Part vi is a discant treatise on the lines of the treatises of Johannes de Garlandia and Franco. The opening section on notation falls in the late Ars Antiqua tradition, reflecting English developments just prior to the innovations of the early 14th-century Johannes de Garlandia reported by Handlo in the *Regule*. It describes the *duplex longa, longa, brevis, semibrevis* (divisible into three *minute ... quasi minime seu velocissime*), plicas, the rules of perfection and alteration, ligatures and the notation of the rhythmic modes. In discussing modal notation it is stated that 'among the early composers of organum the long had only two beats as in meters, but afterward it was brought to perfection, to consist of three tempora'. Some writers have interpreted this to mean that binary modes preceded ternary ones. In fact, it merely refers to the earliest rhythmic modes, I and II, both ternary modes in which a two-beat long alternated with a one-beat breve. In more modern rhythmic notation, the dot has not replaced the short stroke as a *signum divisionis* between *brevis* values; rather, a small circle (*parvulus circulus*) replaces the stroke where the *brevis* is divided into more than three *semibreves* and in hockets of *semibreves* and their rests (dividing the *brevis* in three), where the stroke might be mistaken for a rest.

The chapter concludes with a description of the categories of polyphonic composition: organum purum, rondellus, conductus, copula, motet and hoquetus. This section is also illustrated by numerous musical examples, some of them occurring in continental motet collections, others presumably original. The triplum of one motet on the tenor *Agmina* is found elsewhere only in Handlo's *Regule*. The rondellus technique described and illustrated by a unique three-voice setting, *Ave mater domini*, is not that of the polyphonic rondeau but rather a distinctive constructivist device of English polyphony of the later 13th century.

Odo [Oddo]. The name of several medieval musicians whose identity has been confused. A tonary and treatise of the late 10th century attributed to 'Abbot Odo' may be regarded as the work of an Abbot Odo of Arezzo (see §2), rather than Abbot Odo of Cluny, composer of hymns and antiphons (§1).

A *Dialogus* on music has been attributed to the latter, but it is more probably an anonymous treatise of north Italian provenance (§3). Another tonary, probably of Franciscan origin, has also been wrongly attributed to 'Abbot Odo' (§1), and a simple monk of Cluny named Odo has been confused with Abbot Odo of Cluny (§1). A further tonary, *De modorum formulis*, dating from the 11th century, is an anonymous work showing the influence of Odo of Arezzo and the *Dialogus* (§4).

1. ODO OF CLUNY. Odo, Abbot of Cluny, was born in the Maine in 878/9 and educated by Remigius of Auxerre. He succeeded Berno (*d* 927), the first abbot of Cluny, and died at Tours on 18 November 942. Besides sermons and biblical commentaries, he wrote three hymns (*Rex Christe Martini decus*, *Martine par apostolis* and *Martine iam consul poli*) and 12 antiphons for the monastic Office of St Martin on 11 November (AH, l, 1907/*R*, pp.264–8; ed. J. Szövérffy, *Die Annalen der lateinischen Hymnendichtung*, i, Berlin, 1964, pp.320–23). Odo's authorship of these hymns and antiphons was attested by his first biographer, John, who noted that they were still sung at Benevento ('retinentur hactenus Beneventi', *PL*, cxxxiii, 48*c*).

Although these antiphons are not found in the antiphoner of St Lupo at Benevento (CAO, ii, no.116), the complete series survives in the noted Cluny breviary (*F-Pn* lat.12601, f.153) and in French and Italian Cluniac antiphoners (*Pn* lat.12044, f.203*v*; *I-Rc* 54, f.74*v*–75). They were subdivided into three phrases with cadences ('ternas per singulas habentes differentias'). The antiphon *O beatum pontificem* (CAO, iii, no.4002) quoted in the anonymous *Dialogus* falsely attributed to Odo (*GerbertS*, i, 256), there said to have been corrected musically by 'Abbot Odo', is not one of these antiphons but is a part of the ancient Gregorian repertory.

The likelihood of Odo's authorship of the *Dialogus* (*GerbertS*, i, 252ff, attributed in several manuscripts to 'Odo' or 'Odo abbas') is further reduced by the fact that his first two biographers (*De viris illustribus*, *PL*, clx, 573) did not list it among his works; neither did it survive among the writings of the abbots of Cluny even though the abbey library was scrupulously maintained during the 12th century (see L. Delisle: *Le cabinet des manuscrits de la bibliothèque impériale*, ii, Paris, 1874, p.469, nos.300–14).

The various tonaries falsely attributed to 'Abbot Odo' (see Huglo, *Les tonaires*, 1971, pp.183–5) include a 14th-century *Intonarium a domno Odone abbate diligenter examinatum et ordinatum* (*F-SDI* 42: *CoussemakerS*, ii, 117–49). However, the prologue of this tonary borrows from the Franciscan ruling of before 1254 concerning noted chant books (see M. Huglo: 'Règlement du XIIIe siècle pour la transcription des livres notés', *Festschrift Bruno Stäblein*, ed. M. Ruhnke, Kassel, 1967, pp.121–33) and quotes an antiphon of St Francis; it is, therefore, of Franciscan origin (see Huglo, *Les tonaires*, 184).

Before he was elected abbot, Odo had discharged the functions of *magister scholae*. Another monk also called Odo, but a simple deacon ('Oddo levita'), was the *scholae cantorum magister* at Cluny in 992 (see A. Bruel, ed.: *Recueil des chartes de l'abbaye de Cluny*, iii, Paris, 1884, p.145).

2. ODO OF AREZZO. A tonary with a discussion of the modes is preserved in about 20 manuscripts, of which four specifically attribute the composition of the text to 'the religious lord Abbot Oddo who was skilled in the art of music'. The Proper chants in the tonary, with their frequent references to Bishop Donatus of Arezzo, indicate that this 'Abbot Oddo' compiled his work at Arezzo in the late 10th century. Although several different versions of the text exist, some of them originating in monasteries considerably distant from the city, the association with Arezzo is evident even in those versions that show substantial modification (see Huglo, *Les tonaires*, 1971, pp.223–4).

The prologue to the tonary, 'Formulas quas vobis' (*GerbertS*, i, 248–9), is contained in only six tonaries, all of central or southern Italian origin; three of these contain ascriptions to Odo. The lack of ascription to Odo in the other sources does not mean that he was not the author: successive revisers of his work would not necessarily name the original author of the text. The work is given no title in the extant manuscripts and its initial word, 'Formulas', suggests a description of modal formulae rather than specifying a tonary. However, several treatises by GUIDO OF AREZZO use phrases such as 'formulae modorum/tonorum/super tonos' and 'in modum formulis', or simply the word 'toni', to refer to a tonary, unlike 'regulae' which, unqualified, could signify a treatise on music theory. Merkley's contention that the prologue might be a later accretion is based on the announced intention of the prologue to reform the modal assignments of the chants and the subsequent demonstration that the antiphon *O beatum pontificem* (cf §1 above) should be classified as tone 1 rather than tone 2 and assigned to *differentia* 7 (see Merkley, 31). Although this emended tonal designation is followed in several Italian tonaries and one from southern France (*F-Pn* lat.7185), all of them associated with the prologue (or vice versa), none assigns the majority of its antiphons in the same melodic class as *O beatum pontificem* to *differentia* 7. The emendation itself, however, was transmitted into the 12th century as the prototype of the 'revised' modal formula in the *De modorum formulis* tonary (see §4 below). The number of *differentiae* in the prologue in *I-MC* Q318, pp.125–7 (*GerbertS*) agrees in each of the eight tones with the tonary that follows in the same manuscript.

The surviving sources of the tonary fall into three classes (see Huglo, *Les tonaires*, 186–204): (1) versions of the text containing only minor modifications of the original, for example, *I-MC* Q318 (first tonary), the earliest dated in this group; (2) interpolated versions; and (3) texts deriving from (1) but which do not form a single textual family and contain numerous modifications that distance them from both (1) and (2). The texts of the surviving sources are too disparate and too heavily modified (notably in tones 2, 4 and 5) for a faithful reconstruction of Odo's original text to be tenable, although a comparison of the extant manuscripts would provide some idea of what he might have written. Merkley has suggested that each version of the text may have followed its own individual and independent path, thereby invalidating both the construction of *stemmata* for the tonary and its prologue and the positing of a tonary archetype (Merkley, 32, 56). He does not, however, take into account the existence of 'active texts' (Huglo, 1979, p.309) – those used primarily for instruction and modified at the discretion of the *magister* – such as the theory manuscript of Martin Bodmer (*CH-CObodmer* 77), which is swollen with magisterial accretions.

Both *I-MC* Q318 (first tonary) and *Fs* (see Huglo, *Les tonaires*, pl.III) contain the ascription to Odo, the former proposing to assign antiphons to *differentiae* under their respective modal 'formulae' – presumably the *echemata*. Merkley has approached a reconstruction of the original text by examining seven large representative Italian tonaries and comparing the classification in them of Office antiphons according to their respective *differentiae* with the assignment in the first tonary of *MC* Q318 (see Merkley, 161–236). His analysis shows that the correspondence is greatest – a total of 423 antiphons – in the two tonaries bearing Odo's name. Next in order of compatibility, with 73 correspondences, is *GB-Ob* 25, from central Italy near the Beneventan zone (Huglo, *Les tonaires*, 197), followed by *CH-CObodmer* 77, *I-Fn* conv.soppr. F III 565, *Lc* 603 and *MC* Q318 (second tonary), which includes the tonus peregrinus. From this examination of successive versions of the tonary, it is clear that although the original Odonian text has undergone substantial revision, it has nevertheless survived in the distribution of the majority of the antiphons to the 41 *differentiae* proposed by Odo.

3. THE ANONYMOUS 'DIALOGUS'. A *Dialogus* on music is attributed in a dozen manuscripts as in Gerbert's edition (*GerbertS*, i, 252–64) to Odo. This treatise, compiled in the province of Milan, came to bear this attribution because the author mentioned that Abbot Odo had corrected the antiphon *O beatum pontificem* for modal reasons; an Italian or German copyist then came wrongly to ascribe the whole treatise to Odo (see Huglo, 1969). The Odo in question here is in fact Odo of Arezzo rather than Odo of Cluny. (See also §1.)

The *Dialogus* (partial Eng. trans. in *StrunkSR1*, 103–16) consists of 18 chapters and deals with the division of the monochord (1–2), the intervals (3–5) and the modal system (6–18). This treatise is one of the earliest datable documents using the term 'gamma' with reference to the monochord, although it occurs in the *Musica enchiriadis* (late 9th century) as the name of the lowest note of the gamut (*gamma ut*; see Meyer, p.xxix). The active diffusion of the monochord measurement of the *Dialogus* was widened by its association in manuscripts that circulated Guido's texts, and its ascending progression through two successive tones was continually adopted into, for example, organistrum tuning (Meyer, pp.xlii, lviii). Another treatise, *Musicae artis disciplina* (*GerbertS*, i, 256ff), shares much of the content of the *Dialogus* and is regarded by Oesch as an earlier version.

In nine of the manuscripts, the *Dialogus* is preceded by a prologue (*GerbertS*, i, 251–2; ed. Huglo, 'Der Prolog', 1971, pp.138–9). This had a separate origin and was apparently composed for an antiphoner with alphabetic notation, only later coming to be attached to the anonymous *Dialogus*. Guido of Arezzo drew on this prologue for his *Prologus in antiphonarium* and even for the prologue to his *Micrologus*.

4. 'DE MODORUM FORMULIS'. The anonymous tonary known as *De modorum formulis* (ed. Brockett), composed during the second half of the 11th century, shows the influence of the work of Odo of Arezzo and the anonymous *Dialogus de musica*, which was closely associated with Guido of Arezzo (*b c*990) though not written by him. *De modorum formulis* probably originated in central Italy and subsequently spread northwards. The untitled preface to the tonary, 'Vocum modus' (Brockett, 46–56), is known to have been preserved in five sources: the manuscript at St Blasien, now lost, that Gerbert used in his preparation of the text (*GerbertS*, ii, 37*a*–40*b*, there attributed to Guido); *F-Pn* lat.10508 (*CoussemakerS*, ii, 78*a*–81*a*; published without the figure); *I-MC* 318, pp.208–14 (see Brockett, pl.I), in which it is widely separated from Odo of Arezzo's prologue 'Formulas quas vobis' on p.127; *Fl* Ashb.1051, ff.67*r*–68*r*; and *CH-CObodmer* 77, ff.109*v*–111*r*. The last three sources are fragmentary.

The rationale of music theory found in the prologue was influenced by Remigius of Auxerre's commentary on book 9 of the *De nuptiis Philologiae et Mercurii* of Martianus Capella and by the works of Guido of Arezzo, especially the *Micrologus* (*c*1030; see esp. chaps.6, 8, 12 and 16) and the *Epistola de ignoto cantu directa* (also known as *Epistola ad Michaelem*; *GerbertS*, ii, 43–50; see Brockett, 7–17, 19, 21). The most Guidonian aspects of the prologue are the designation of *differentiae* ('formulae' in the text) in relation to the initial pitches of the chant (*differentiae* with melodies higher than the initial pitch are classified as *praepositivae*; those that are equal are termed *appositivae*; and those that are lower are *suppositivae*) and the categorization of chant melodies accordingly within each of the eight tones. Guido's terminology – *praepositae*, *appositae* and *suppositae* – was almost identical to that of the prologue and was adopted in the following tonary; however, Guido's designation of two further categories of 'motions of notes', namely the *interpositae* and *mixtae*, are not used in the tonary.

The author of the *De modorum formulis* differs from Guidonian theory in his use of a three-tetrachord complex – *mediae* (*finales*), bordered by *graves* and *acutae* – adapted to the eight tones; the *Micrologus* (chap.11) employs a four-tetrachord standard, including the *superacutae*. The author also uses C rather than Guido's A as the orientation pitch. Such differences and the paucity of evidence linking Odo with the work makes it unlikely that he was the author of *De modorum formulis*. However, the correspondence between the prologue and the tonary suggests that they were originally intended to be together.

The tonary (Brockett, 57–128) is identified in precisely those sources designated in class (2) above (see §2): *F-Pn* lat.10508 (*CoussemakerS*, ii, 81*a*–109*b*, but with misinterpretations and inaccuracies); *GB-Ob* Digby 25; *I-Rvat* Reg.lat.1616; *GB-Lbl* Add.10335 (lacking tones 1 and 2); the St Blasien manuscript, no longer extant, used by Gerbert (*GerbertS*, ii, 41*a*–*b*), which contained only the introduction leading up to the formula of tone 1. These sources are remarkably consistent in their assignments of *differentiae* and the ordering of antiphons within each category, but they diverge considerably from the ordering characteristic of class (1). For example, in the longest list of antiphons – which occurs in tone 1, *differentia* 1 – the sources containing the *De modorum formulis* (class 2) all present a similar order of antiphons, although the total number of chants varies; the manuscripts with the two Odonian texts (class 1) disagree radically with the class 2 sources and with each other (see Brockett, 163–5). A process of codification appears to have occurred between the 11th and 12th centuries that produced the more consistent list of the *De modorum formulis*.

The treatment of the *differentiae*, which are described in the prefaces to each tone and notated in the tonary proper, respects to a certain extent the tradition transmitted by Odo of Arezzo's tonary and its preface 'Formulas quas vobis'. The discrepancies probably result from the arbitrary categorizations that situate them above, below, or apposite with the antiphon intonation; they occur in tones 2, 4 (with six *differentiae*, but its preface stating nine), 5, 7 and 8 (with four *differentiae*, but the preface delineating six). Tone 1 appends three additional *differentiae*, evidently for the adjustment of dubious assignments to this tone; tone 2 appends one, perhaps intended to accommodate antiphons intoned and terminating on the upper 5th like its specimen. The tonary contains 689 Office antiphons, 146 introits, 97 communion antiphons, 11 responsories and 9 responsory verses (Brockett, 162).

MICHEL HUGLO (1, 3), CLYDE BROCKETT (2, 4)

O'Donnell, Bertram Walton (*b* Madras, 1887; *d* Belfast, 20 Aug 1939). English conductor and composer of Irish descent. He grew up with military bands; his father and brothers Percy and Rudolph all conducted them, embracing between them Army, Royal Marines and RAF. O'Donnell was in the Marines at Portsmouth (1917–23) and Deal, but most notably conducted the BBC (Wireless) Military Band, formed in August 1927 and which survived until 1943, latterly under his brother Percy. It inspired, besides his own and others' arrangements of classical works, some original music including Holst's *Hammersmith* (1931).

Curiously the band's programmes included little of O'Donnell's own music yet this was brilliantly inventive and, for its time, harmonically adventurous. The *Two Irish Tone Sketches* and *Songs of the Gael* draw upon his links with Ireland, while *Three Humoresques* may derive from Jane Austen. These, with *Woodland Sketches*, were

later arranged for orchestra. Other pieces were originally orchestral, such as the modestly astringent *Miniature Suite*, and in these his writing for strings shows an understanding of resources beyond those of the military band. O'Donnell died two years after becoming head of the BBC Northern Ireland Region. His work is discussed in P.L. Scowcroft: *British Light Music: a Personal Gallery of Twentieth-Century Composers* (London, 1997).

WORKS
(*selective list*)

Military band: Theme and Variations (1920); Three Humoresques, op.28 (1923): 1 Pride and Prejudice, 2 Prevarication, 3 Petulance and Persuasion; 2 Irish Tone Sketches, op.20 (1923): 1 The Mountain Sprite, 2 At the Pattern; Songs of the Gael 'Amráin na n-ġaedeal', a Gaelic Fantasy, op.31 (1924); Crusader March; Woodland Sketches; many arrs.

Orch: Miniature Suite; The Irish Maiden; Minuet; Fragment for Strings; Three Humoresques; Woodland Sketches

Other inst: A Slumber Song, vn/vc, pf (1911); 2 Lyric Poems, pf (1914): When the Sun is Setting, Before the Dawn

PHILIP L. SCOWCROFT

Odorannus of Sens [Odoramnus Senonensis] (*b c*985; *d* 1046). Theorist and composer. Professed as a monk of St Pierre-le-Vif at Sens, Odorannus was trained in metal-working, sculpture and mechanics. His monastic observance seems to have been a constant reproach to his slacker brethren, whose enmity forced him to retire to St Denis from 1022 to 1023. He returned to his monastery in triumph, and in 1028 was commissioned by King Robert and Queen Constance to make a reliquary for the relics of St Sabinian and subsequently one for those of St Potentian. He commemorated those saints in an account of the translation of their relics and in the composition of an Office in their honour. The Office and Odorannus's theoretical writings are preserved in an autograph manuscript (*I-Rvat* Reg.lat.577), once the property of Queen Christina of Sweden. His theoretical writings (ed. M.E. Duchez and M. Huglo, *Odorannus de Sens: Opera omnia*, iv–v, Paris, 1972) include a tonary, which apparently influenced other theorists, and two treatises consituting a practical guide to the performance of plainchant and a summary of the theory of musical pitch before the acceptance of Guido of Arezzo's reforms. He also wrote on other aspects of the liturgy, as well as history, canon law and scripture.

FREDERICK HAMMOND/R

Odoyevsky, Prince **Vladimir Fyodorovich** (*b* Moscow, 1/13 Aug 1804; *d* Moscow, 27 Feb/11 March 1869). Russian author and writer on music. Best known for his short stories, he was also the first significant Russian music critic. After attending the Noble Boarding School attached to Moscow University, he worked in several branches of government, initially in Moscow, then from 1826 in St Petersburg and from 1862 again in Moscow. His unusual range of interests – from the natural sciences to education, from social organization to anatomy – made him an invaluable employee, and brought him a wide circle of acquaintance which included almost every important figure in Russian literature from Pushkin (whom he knew well) to Turgenev and Tolstoy; the poet and Decembrist A.I. Odoyevsky was his cousin. An early fascination with philosophy drew him to German idealism and particularly Schelling. His prose writings include satires on contemporary life and tales of the fantastic as well as the futuristic *The Year 4338*. The collection *Russian Nights*, published in 1844, draws together stories and philosophical studies previously issued separately, including two musical stories, *Beethoven's Last Quartet* (1831) and *Sebastian Bach* (1835).

Odoyevsky's career in literature ended with the publication of *Russian Nights*, after which he immersed himself in charitable works; but his early involvement in music continued until the end of his life. He contributed reviews to periodicals and entries to encyclopedias; he sought to influence musical life through contacts in high society and the world of musicians (Glinka was among his close friends); and he kindled in others his own enthusiasms, whether for the phenomena of acoustics, ancient Russian church music, Russian folksong, choral singing using Chevé notation, or the enharmonic piano. Odoyevsky revered Bach, Mozart and Beethoven, and was hostile to modern Italian opera, partly because of its hold over fashionable society and its predominance in Russian theatres. He was a champion of Russian music, especially of the works of Glinka, whose *A Life for the Tsar* he acclaimed in 1836 as the beginning of a new period in musical history, 'the age of Russian music'. In 1850 he included three Glinka premières in an orchestral concert for whose programme he was responsible. Following visits to Russia by Berlioz (in 1847 and 1867) and Wagner (in 1863) he wrote articles enthusiastically promoting their music.

At a time when musically knowledgeable criticism barely existed in Russia, Odoyevsky's writings were informed by his experience as a pianist, organist and composer (one of his piano works, *Berceuse*, was edited and published by Balakirev in 1895) and by the breadth of his interests. The creation of a chair in the history of Russian church music at the new Moscow Conservatory was a tribute to Odoyevsky's research in that field and to his view that the intellectual aspects of music should not be overwhelmed by the study of the mechanics of performance.

STUART CAMPBELL

Odstrčil, Karel (*b* Valašské Meziříćí, 5 August 1930; *d* Prague, 21 May 1997). Czech composer. While studying at the University of Mining in Ostrava he took private lessons in the piano, conducting and composition as well as conducting the University Music Ensemble of Ostrava. He then taught at the Secondary Technical School in Příbram and continued his composition studies with Klement Slavický for several years (1957–63). The première of his orchestral work *451° Farenheita* in 1964 led to him being recognized as one of the most significant Czech composers. His richly inventive music incorporates various avant-garde techniques while his experience as a technician deeply affected the development of his electro-acoustic works. He was a co-founder of the first Czech electro-acoustic studio in Plzeň; he also worked with the Via Lucis group based in Brno which attempted to visualize music using laser lights. From 1990 until his death he was president of the Society for Electro-Acoustic Music. He founded the international competition for the creation of electro-acoustic works, Musica Nova.

WORKS
(*selective list*)

Stage: Antithese (ballet, 3 pts), 1966, concert perf., Prague, 1970; Devátá vlna [The Ninth Wave] (ballet, 1), 1966, Bratislava, Slovak National Theatre, 1967; Buratino (ballet, 4 scenes), 1967, Plzeň, J.K. Tyl Theatre, 1978; Tkáň [The Tissue] (op, R. Lukeš), 1975, Brno, Operú Studio JAMU, 1978; Království času [The Realm of Time] (children's op, D. Zeman), 1979; Toro (ballet), 1980, Liberec, F.X. Šalda Theatre, 1981; Poklad [Treasure] (stage qnt, after K.J. Erben), 1983; Svatební košile [The Spectre's Bride] (stage qnt, after Erben), 1983; Upír contra 007 [Vampire Versus 007] (ballet), 1984; Tarzanova smrt [Tarzan's Death] (op-ballet, Odstrčil, after J. Nesvadba), 1985; Hrabě Monte Christo [Count Monte Christo] (op, 2, J. Someš, after A. Dumas), 1989; Devět křížů [Nine Crosses] (op-ballet, Someš), 1990

MOJMÍR SOBOTKA

O'Dwyer [Dwyer], **Robert** (*b* Bristol, 27 Jan 1862; *d* Dublin, 6 Jan 1949). Irish conductor and composer. Born Robert Dwyer of Irish parentage in Bristol, he was a leading voice in the movement to establish a distinctive, nationalistic school of Irish composition. He began his career in 1891, first conducting the Carl Rosa Opera Company and later touring with the Rousbey Opera Company until 1896. He settled in Dublin in 1897 where he held various posts as organist, conductor, composer and teacher. As a critic, O'Dwyer contributed to the influential periodical *The Leader*, a publication that may have honed his strong nationalistic views. Sympathetic with the aims of the broad cultural movement known as the Gaelic revival, he found a further outlet for nationalistic expression with the creation of the Gaelic League's Oireachtas Choir (1902). He subsequently became the choir director. The opera *Eithne*, his major work, was written for the annual Oireachtas festival in 1909. Thomas O'Kelly's libretto was later translated into Irish, gaining the work particular attention as the first opera to employ an Irish text. Largely on the strength of the opera's success, O'Dwyer was appointed chair of Irish music at University College, Dublin, a part-time post sponsored by Dublin Corporation. He held this appointment until his retirement in 1939.

JOSEPH J. RYAN

Odyssey. A duophonic SYNTHESIZER manufactured by ARP Instruments in Newton Highlands, near Boston (later in nearby Newton and Lexington), from 1971 until the company's demise in 1981. *See* ELECTRONIC INSTRUMENTS, §IV, 5(ii).

Oede de la Couroierie [Eude de Carigas; Odo de Corigiaria; Odon de Paris; Odon de Saint-Germain] (*d* 1294). French trouvère. He acted as a *clerc* to Count Robert of Artois. In this capacity his activities, which often included delicate diplomatic missions, were documented from 1270 until his death in 1294. His will, registered in June of that year, provided for the maintenance of his mistress and two illegitimate daughters in addition to his widow and her three children. In the documents he is referred to as Odon de Paris and Odon de Saint-Germain; this indicates that although he spent most of his working life in Artois he was probably born in the Ile-de-France.

The five songs attributed to him are of interest largely because they are all modelled on songs by older trouvères; two are based on a song of Gace Brulé, who was active at the turn of the 13th century; a third is set to the melody of a song by Blondel de Nesle, who lived in the second half of the 12th century; a song by a near contemporary, Raoul de Soissons, was the source for yet another.

ROBERT FALCK

Oeglin, Erhard (*b* Reutlingen; *d* ?Augsburg, *c*1520). German printer. In 1491 he became a citizen of Basle, where he served his printer's apprenticeship. He was registered at the University of Tübingen in 1498 and joined the printer Johann Otmar, also a native of Reutlingen, with whom he moved to Augsburg in 1502. Here he printed works on a variety of subjects, some in collaboration with Otmar, some with Georg Nadler and some alone. They include several publications commissioned by Emperor Maximilian I.

In music Oeglin is known mainly for two collections: the four-part settings of 22 Latin odes by Petrus Tritonius (1507) and a group of 42 German songs and six Latin texts, also set for four voices (RISM 1512[1]). Of a further collection of 68 German songs only the discant partbook survives (*c*1513[3]). The books of German songs include the works of such composers as Isaac, Hofhaimer and Senfl, all associated with Maximilian's court, and thus reflect the court's musical repertory. An excellent craftsman, Oeglin was the first German printer to use Petrucci's technique of multiple impression, although he reduced it to double impression by printing the lines and notes together. The songbooks are decorated with woodcuts by Hans Burgkmair.

MARIE LOUISE GÖLLNER

Oe'Harahap, Irwansyah. *See* HARAHAP, IRWANSYAH.

Oehler, Oskar (*b* Annaberg, Erzgebirge, 2 Feb 1858; *d* Berlin, 1 Oct 1936). German woodwind instrument maker and clarinettist. He developed the clarinet of the German-speaking world to its modern state; this model is thus known as the Oehler system clarinet. His excellent instruments were still prized at the end of the 20th century. Oehler was trained as an organ builder and clarinettist, and set up a woodwind instrument making workshop in Berlin in 1887. For the clarinet he devised additional venting, making the tone and intonation of the Baermann clarinet more even, and designed a mechanism that enabled his new vent keys to operate extremely reliably and with very little additional work from the fingers (the 28 tone-holes of the Oehler system clarinet are controlled by the same number of keys as the 22 tone-holes of the Baermann system instrument). The mechanism for properly venting the forked *b♭/f″* on the right hand is particularly complex, and Oehler worked through several versions before arriving at one that is reliable and effective in all three registers of the clarinet. He is also credited with the idea of making the table of the clarinet mouthpiece slightly concave, a design that ensured (especially in the case of a wooden mouthpiece) a good seal against the reed. Several important makers, most notably F. Arthur Uebel (1888–1963), and also Ludwig Warschewski (1888–1950), served apprenticeships with him and spread his ideas. Oehler was also a distinguished orchestral clarinettist whose last post was in the Berlin PO (1882–8).

NICHOLAS SHACKLETON

Oehlschlägel [Oehlschlegel, Oelschlegel], **Franz Joseph** [Lohelius, Joannes] (*b* Lahošť, nr Duchcov, Bohemia, 31 Dec 1724; *d* Strahov, Prague, 22 Feb 1788). Bohemian composer, choirmaster, organist and organ builder. He was a church organist first in Bohosudov and from about 1741 in Prague. After finishing his philosophical studies he joined the Premonstratensian order in August 1747, taking the name Joannes Lohelius, under which most of his music was written. His earliest autographs date from about 1755. Besides serving as choirmaster of the monastic churches at Milevsko (1749–50) and at Strahov (from November 1756), he spent 15 years rebuilding the Strahov church organ, making it one of the best and largest in Bohemia at the time (Mozart tested and admired it in autumn 1787); he also designed the organ of the Barnabite monastic church of St Salvator in Prague.

Oehlschlägel was a pupil of J.A. Sehling and Franz Habermann, but he evidently felt a strong inclination towards the more modern idiom of his younger contemporaries Antonio Boroni and F.X. Brixi; works of the latter are predominant in the music he copied for the Strahov choir. His own works show an amalgamation of pre-Classical and early Classical elements. His church oratorios are operatic in style, with large da capo arias, and are remarkable for the skilful treatment of wind instruments in their orchestral accompaniments. Although he was one of the most authoritative and prolific composers of Bohemian church music in the second half of the 18th century, none of his works was printed during his lifetime.

WORKS

Anima desolata (Anima afflicta) (operetta pastoritia), Strahov, 6 Jan 1761, *CZ-Pnm*

Easter orats (perf. Strahov, Premonstratensian abbey; only printed libs extant unless otherwise indicated): Captiva filia Sion, 1757; Fortis in bello amor et maeror, 1758, *Pnm*; Justitia et clementia, 1759; Innocentia et pietas, 1760; Patientia et humilitas, 1761, *Pnm*; Vox filiae Sion, 1762; Patientia victrix, 1763; Jesus Christus gloriose . . . triumphans, before 1779, *Pnm*

Numerous other sacred works, autographs mostly *Pnm*, other MSS in *Bm*, *Pak* (see Kouba, 1969)

MILAN POŠTOLKA

Oehman, Carl-Martin (*b* Floda, nr Göteborg, 4 Sept 1887; *d* Stockholm, 26 Dec 1967). Swedish tenor. He studied the piano and the organ at the Stockholm Conservatory, and then, privately, singing in Stockholm and Milan. He appeared first in concerts in 1914, making his operatic début in *Fra Diavolo* at Göteborg three years later. The Swedish Royal Opera, which became the centre of his career, heard him first in 1919 and last in 1941. He became well known for his singing of the more lyrical Wagnerian roles, yet in his single season at the Metropolitan in 1924 he appeared only as Laca in the American première of *Jenůfa* and as Saint-Saëns's Samson. At Covent Garden in 1928 he sang Tannhäuser and Walther in *Die Meistersinger*: the power of his full voice and the charm of his *mezza voce* were admired. Some of his best work was done in Berlin, where he sang in the local première of *Simon Boccanegra* (1930). As a teacher he numbered among his pupils Jussi Björling, Martti Talvela and Nicolai Gedda, all of whom paid warm tribute to his musicianship and clarity. On recordings he is somewhat variable, but at best the voice has fine quality and the style remarkable sensitivity.

J.B. STEANE

Oehring, Helmut (*b* Berlin, 16 July 1961). German composer and guitarist. Born a hearing child to deaf parents, his first language was sign language. He trained as a construction worker (1978–80); as a conscientious objector to military service (1986–7) he worked as a cemetery gardener, in forestry and as a night watchman. Self-taught as a composer, his first works included incidental music and a string quartet. After consultations with Asriel, Goldmann and Zapf, he attended Katzer's masterclass at the Berlin Akademie der Künste (1990–92). His honours include the Hanns Eisler Prize (1990), a young composer's award from West German Radio, Cologne (1992), the Orpheus Prize, Italy (1996), the Hindemith Prize (1997) and the Schneider-Schott Music Prize (1998).

Oehring's compositions derive from the complex physical and facial expressions of sign language, which he notates as music. His works outline bleak narratives that address the chasm between individuals and the futility of communication. His early compositions are concerned with stages of agony and human actions that lead to death; in later works, speech as a symbol of the impossibility of human discourse becomes the central musical subject. Much of his work can be considered social criticism. Several compositions include deaf people among the performers.

GISELA NAUCK

Oelze, Christiane (*b* Cologne, 9 Oct 1963). German soprano. She studied with Klesie Kelly-Moog and Erna Westberger, working for the first years of her career in concert and oratorio. In 1990 she made her operatic début as Despina in *Così fan tutte* at Ottawa, with a first appearance at Salzburg the following year as Konstanze in *Die Entführung*. Her performance as Anne Trulove in *The Rake's Progress* at Glyndebourne in 1994 was widely praised, and the same year audiences at Covent Garden enjoyed her delightful Zdenka in *Arabella*. She returned to Covent Garden as Servilia (*La clemenza di Tito*) in

2000. In 1995 she sang Pamina in a series of performances of *Die Zauberflöte* conducted by John Eliot Gardiner that were also filmed and recorded; and in 1996 she was the Marzelline in Gardiner's revival of Beethoven's *Leonore*.

Her pure, delicate timbre is matched by a graceful style which can lend itself more readily to expressions of happiness than of grief and deep thoughtfulness. This was sometimes remarked upon with regard to her Pamina and it has somewhat limited the effectiveness of her lieder singing. However, recordings such as that of songs by Webern show a not inappropriate coolness as well as a charming voice and resourceful musicianship.

J.B. STEANE

Oesch, Hans (Rolf) (*b* Wolfhalden, canton of Appenzell, 10 Sept 1926; *d* Anwil, Basle, 7 May 1992). Swiss musicologist. He studied musicology from 1946 with Jacques Handschin at Basle University, where he took the doctorate in 1951 with a thesis on Guido of Arezzo. Until Handschin's death in 1955 he was an assistant lecturer in the Basle musicology institute, and from 1951 to 1966 was music critic on the *National-Zeitung* in Basle. He completed the *Habilitation* in 1959 at Zürich with a work on the medieval theorists Berno and Hermannus Contractus. Until 1967 he lectured at Zürich on ethnomusicology and medieval music history. At the same time he held a similar appointment at Basle University, where he succeeded Schrade as professor of musicology in 1967. He was also editor (1972–4) and co-editor (1975–8) of *Melos* (the leading German-language periodical for contemporary music), chairman of the Heinrich-Strobel-Stiftung in Freiburg (1973–92) and academic coordinator of the Paul Sacher Stiftung (from 1986). He retired in 1991.

Influenced by his teacher Handschin's Enlightenment belief in a 'universal' approach, Oesch dedicated himself to the 'musical people of all times and all populations', focussing his work on two diverse areas, 20th-century music and ethnomusicology. In connection with the latter, he directed several field projects (in Malacca, Malaysia, 1963; in India, Indonesia and elsewhere in South-east Asia, 1974), whose findings were documented in a series of recordings. Oesch's fieldwork was significant for its early attempts to overcome Eurocentrism in favour of a more open-minded approach to cultural history. In *Aussereuropäische Musik* (1984–7), Oesch summed up the guiding principle of his scholarship: to arrive at a world history of music in all its similiarities and differences, musical cultures must be examined in terms of their own underlying principles. Oesch also had personal contact with many modern composers and was convinced of the importance of a scholarly grappling with the 'Ars Nova of the 20th century'. In addition to his many years as editor and writer in this field, he was engaged with public concert life, undertaking the role of spokesman for repertory outside the canon of both old and new music.

JÜRG STENZL/R

Oeser, Fritz (*b* Gera, 18 May 1911; *d* Kassel, 23 Feb 1982). German musicologist and editor. He studied at the Realgymnasium, the university and the conservatory in Leipzig; among his teachers in musicology were Helmuth Schultz and Theodor Kroyer. In 1938 he joined the staff of the Musikwissenschaftlicher Verlag, Leipzig. Following military service during World War II, he became director of the Brucknerverlag, Wiesbaden, in 1947; the firm became Alkor-Edition, Kassel, in 1955. He retired in 1971. Oeser's main areas of study were Bruckner's music, Czech music, and Russian and French opera in the 19th

century; among his writings, mostly on operatic subjects, is a study of the texts of Bruckner's symphonies, *Die Klangstruktur der Bruckner-Symphonie* (Leipzig, 1939, 2/1941), with which he obtained the doctorate at Leipzig University in 1939. He edited several orchestral works, notably Bruckner's Third Symphony (1878 version; Wiesbaden, 1950), made a number of German translations of operas and prepared performing versions of several operas, including Gounod's *Faust* (Kassel, 1972) and Offenbach's *Les contes d'Hoffmann* (Kassel, 1975). The most important is that of Bizet's *Carmen* (Kassel, 1964; see Oeser's article 'Neu entdeckte "Carmen"', *Musica*, xviii (1964), 108–14), in which much music traditionally omitted is restored; his edition has however been criticized for misrepresenting Bizet's final intentions (see W. Dean: 'The True Carmen?', *MT*, cvi (1965), 846–55, rev., *Essays on Opera*, Oxford, 1990, 281–300; for biography see H. Vogt: 'Fritz Oeser', *Musica*, xxxvi (1982), 194–6).

BENJAMIN KORSTVEDT

Oesterreicher, Georg (*b* Wiebelsheim, nr Windsheim, Franconia, 1563; *d* Windsheim, 9 Jan 1621). German composer, music editor, poet and schoolmaster. From 1585 he studied at Wittenberg University. In 1588 he became teacher at the grammer school of the imperial town of Windsheim and in 1608 was promoted Kantor. In this post he produced numerous German and Latin school plays, which gained wide recognition. He edited a hymnal for the town of Windsheim, *Geistliche Lieder aus dem Catechismo ... zugericht* (Giessen, 1614), which is lost, but the posthumous second edition, *Ein recht christlich Gesangbüchlein* (Rothenburg ober der Tauber, 1623), survives. Alongside many hymns then in general use, it contains texts and unharmonized melodies by Oesterreicher himself. Several of these melodies appear too in the Ansbach, Rothenburg and Heilbronn hymnbooks of that period. Oesterreicher also composed the music for the funeral service of Margarethe Barbara Seubold at Ansbach in 1620. The 'Cantor-Büchlein' of 1615 that Gerber attributed to him is probably identical with the 1614 edition of the Windsheim hymnal, which was listed in 1615 in the catalogue of the Frankfurt Book Fair. (*EitnerQ*; *GerberNL*; *GöhlerV*; *ZahnM*)

FRANZ KRAUTWURST

Oestvig, Karl Aagaard (*b* Christiania, 17 May 1889; *d* Oslo, 21 July 1968). Norwegian tenor. He studied at Cologne and made his début in 1914 at Stuttgart, where he sang the Lay brother/Giovanni in the first performance of Max von Schillings's *Mona Lisa* (1915). Engaged at the Vienna Staatsoper from 1919 to 1927, he created the role of the Emperor in Strauss's *Die Frau ohne Schatten* (1919); from 1927 to 1930 he sang at the Berlin Städtische Oper. His repertory included Tamino, Lohengrin, Walther, Parsifal, Don José, Hoffmann, Paul in Korngold's *Die tote Stadt*, Bacchus in *Ariadne auf Naxos* and Max in Krenek's *Jonny spielt auf*, which he sang at Munich on 16 June 1928, when the performance was interrupted by a Nazi demonstration. A very stylish singer, he brought a lyrical approach even to his heavier, more dramatic roles. In 1932 he retired to Oslo, where he taught singing and produced opera.

ELIZABETH FORBES

Oettingen. Oettingen-Oettingen and Oettingen-Wallerstein were two small German courts in Swabia, south of Ansbach; the former had a brief musical importance in the late 17th century and the latter was particularly prominent in the late 18th century. The house of Oettingen, whose history dates from the mid-12th century, was divided during the 16th century into Protestant and Catholic branches, with Oettingen belonging to the former, Wallerstein to the latter.

A court Kapelle is known to have existed in Oettingen during the reigns of both Albrecht Ernst I (1674 to his death in 1683) and his successor, Albrecht Ernst II (1683–1731). The most important musician active in Oettingen was Johann Georg Conradi (see Jung), the son of the Oettingen organist Caspar Conrad, who was Kapellmeister from 1671. From 1689 the court Kapelle consisted of about a dozen musicians, and court opera performances are known at least for the period 1699–1703 (see Brockpähler). Conradi, who left Oettingen in 1683, was succeeded by Jakob Christian Hertel. However, at the end of Conradi's successful career as a Hamburg opera composer, he returned to Oettingen as Kapellmeister in 1698. He was succeeded in about 1699 by his son Johann Melchior, who remained in the post until the court was dissolved in 1732 and joined to that of Oettingen-Wallerstein.

Musical institutions at Wallerstein were greatly strengthened during the reign of Count Philipp Karl (1745–66), though the music was mainly functional, for church and for entertainment during dinner and after the hunt. The count's Hofmusik, primarily wind players and mainly Bohemians, included some of Germany's finest horn players (e.g. Friedrich Domnich and Johann Türrschmidt, both founders of important families of horn players), and the composers Ignaz Klauseck (at Wallerstein from 1747 to 1751) and Franz Xaver Pokorny (employed there from about 1751 to 1770).

After Philipp Karl's death (1766) his widow, Countess Juliane Charlotte, acted as regent for her son. Under the countess's administration conditions deteriorated and many musicians left Wallerstein. A turning-point in Wallerstein's musical history occurred in 1773 when Kraft Ernst assumed control of the countship, which one year later was elevated to a princedom. Almost immediately the new prince began to form a Hofkapelle. His musical training by several of his father's court musicians and at the imperial Savoyische Ritterakademie in Vienna enabled him to make a good selection. To the unpretentious group of musicians inherited from his father, he added several acknowledged virtuosos, including Antonio Rosetti (Anton Rösler, violone), Josef Reicha (cello), Anton Janitsch (violin), Joseph Fiala (oboe) and Johann Nisle (horn). To complete his ensembles he employed household servants who could double as musicians.

After the death in 1776 of Kraft Ernst's young wife, Maria Theresa, born princess of Thurn und Taxis, the court entered an extended period of mourning, putting a temporary halt to the development of the Kapelle. Several musicians left, and others were given permission to travel. It was during this period that Mozart, on his way to Mannheim, stopped at Hohenaltheim, the prince's *Lustschloss*. The prince, who was still in mourning, would hear no music, and Mozart left without performing for the court. By 1780 Kraft Ernst was again ready to focus his attention on music. New talent was hired for the

Hofkapelle. Significant musicians in this group were Franz Zwierzina and Joseph Nagel (horn), Christoph Hoppius (bassoon) and Gottfried Klier (oboe). Wallerstein's musical reputation grew rapidly; by 1784 C.F.D. Schubart wrote that 'music flourishes there in a most excellent degree'. In the mid- to late 1780s the Wallerstein court orchestra numbered approximately 24 members, being a combination of professional performers and house servants with some musical skill (see Rosetti and *Musikalische Realzeitung*).

As at Mannheim several members of the Wallerstein orchestra were also active as composers, in fact a virtual school of composers developed there during the 1770s and the 1780s, headed by Intendant Ignaz von Beecke and Kapellmeister Antonio Rosetti and including Josef Reicha, Joseph Fiala, Georg Feldmayr, Paul Wineberger, Franz Zwierzina, Anton Hutti, Joseph Nagel and Friedrich Witt. The court music library, originally housed in Schloss Harburg (now in *D-Au*) includes, in addition to the works of these 'house composers', others by most of the popular composers of the time, including a large collection of Haydn's symphonies, some commissioned by Kraft Ernst.

The prince encouraged travelling musicians to perform at Wallerstein and among his more illustrious guests were Jan Zach in 1773, Beethoven in 1787 and Haydn on his first journey to London in 1791. Haydn is reputed to have said on hearing the Wallerstein orchestra that 'no orchestra plays my music with such precision as this ensemble'.

After Kraft Ernst's death in 1802 the Wallerstein Hofkapelle entered a period of steady decline and was eventually dissolved. In 1806 Oettingen-Wallerstein was incorporated into the state of Bavaria and the increased financial burdens of the following years forced Kraft Ernst's widow, Countess Wilhelmine Friederike, to release most of the court musicians. A reorganization of the Hofkapelle was attempted under Prince Ludwig Kraft in 1812, the court music director being Xaver Hammer, a local musician. The Weimar composer Franz Seraph von Destouches was connected with the court during this period. In a further attempt to revitalize the court music Prince Ludwig established a quartet school under Hammer's direction in 1817, but Hammer died the following year and the venture failed. Hammer was replaced by Johannes Andreas Amon from Bamberg. In the next few years the prince spent more and more time away from court and finally, in 1821, court concerts were discontinued. After Amon's death (1825) virtually all secular music at Wallerstein ceased. Wallerstein's last Kapellmeister, Johann Michael Mettenleiter, died in 1859. The decline of Wallerstein's music coincided with the end of the tradition of court music in Germany. For an illustration of the wind band at Oettingen-Wallerstein in about 1783 *see* HARMONIEMUSIK.

The town of Oettingen is the seat of the well-known firm of organ builders, G.F. STEINMEYER (founded 1847), which has been responsible for the building of almost 2400 organs, including the cathedral organs of Bamberg, Munich, Speyer, Passau and Trondheim.

STERLING E. MURRAY

Oettingen, Arthur (Joachim) von (*b* Dorpat, Livonia [now Tartu, Estonia], 28 March 1836; *d* Leipzig, 6 Sept 1920). German scientist and musical theorist. After reading sciences at the University of Dorpat (1853–8), he continued his study of physics, physiology and mathematics in Paris and Berlin (1859–62) and completed his *Habilitation* (1863) in Dorpat. In 1865 he was appointed associate professor and in 1866 professor of physics; from 1869 to 1874 he was secretary of the Natural Science Academy in Dorpat, and, from 1877, corresponding member of the St Petersburg Academy of Science. In 1894, after the russification of the University of Dorpat (Yuriev), he took his pension and settled in Leipzig, where he was honorary professor at the university until 1919.

In Dorpat, Oettingen was president of a musical association and director of a well-trained amateur orchestra; he wrote many important articles in the field of natural science, and also won recognition as a musical theorist by the publication of his *Harmoniesystem in dualer Entwickelung* (1866). He developed the idea that major and minor triads and key systems are mirror inversions of each other: that the major triad C–E–G, designated c^{+}, is mirrored by the minor triad C–A♭–F (reading downward), designated c°. The tonic major scale C–D–E–F–G–A–B–C is mirrored by the phonic scale E–D–C–B–A–G–F–E (reading downward), which is the common A minor scale descending from the dominant. In this arrangement the intervals of the two scales are the same and every triad in the tonic scale is mirrored by a triad of the opposite mode in the phonic scale. If the triads repeat their roots, the phonic chords will all be second inversions in the major-minor system.

Oettingen's principle of organization might be summarized by saying that tonality is the property of intervals or chords having a common fundamental tone called the 'tonica', while phonality is the property of intervals or chords possessing a common overtone called the 'phonica'. In the major chord *c′–e′–g′* all the sounds find a focus in the difference tone or fundamental tone, C, and in the minor chord *c′–e♭′–g′*, the fundamental tone is the first common partial tone, *g‴*. The two fundamentals are each two octaves distant from the roots of their respective chords.

Oettingen designed his dual system as the antithesis to Helmholtz's *Lehre von den Tonempfindungen* (1863). He believed that Helmholtz was wrong in his concept of consonance and dissonance. Because even a single tone has beats caused by the higher harmonics approaching each other in pitch, he believed that Helmholtz was measuring merely a greater or lesser dissonance. He thought that Helmholtz's approach was negative, and he advocated simply considering dissonance as a positive meeting of two or more different chords, major and minor chords thus being of equal value. As a proponent of just intonation he used in his figuration system a line over the letter name to indicate a tonic major 3rd and a line under the letter name of the phonic major 3rd, making clear his reference to 3rds of 5/4 ratio rather than to the major 3rds of 81/64 ratio used in Pythagorean intonation.

Oevering, Rynoldus Popma van. *See* POPMA VAN OEVERING RYNOLDUS.

Ofenbauer, Christian (*b* Graz, 24 March 1961). Austrian composer and organist. He studied at the Klagenfurt Conservatory, at the Vienna Musikhochschule with Uhl (1979–82) and Cerha (1982–7), and in Paris (1986) where he was in touch with Boulez. From 1982 to 1987 he worked as an organist at the Votivkirche, Vienna, and as a composer for the experimental drama group Theater-AngelusNovus. He has also performed with the Viennese ensemble Die Reihe. He began working as a freelance editor for Universal Edition in 1985. His teaching appointments have included positions at the Graz Musikhochschule (1986, 1987–91), the University of Giessen (1988, 1991), the Vienna Musikhochschule (from 1989, visiting professor 1991–2) and the Musikhochschule of the Salzburg Mozarteum (visiting professor 1994–7).

Contrasts in Ofenbauer's work, such as the harsh tonality of the *Streichquartettsatz 1997* in comparison to the much gentler music of *unordentliche inseln/de la motte fouqué-vertonung* (1995), indicate his reluctance to adopt a consistent style. The issue of identity has been a theme in a number of Ofenbauer's compositions; in *Medea* (1990–94), for example, the role of the heroine is shared by seven soloists. Later works, such as the violin *concerto fancies/fancy papers* (1997), show an increasing tendency towards tranquillity and subtle transitions.

WORKS

Dramatic: Tod des Hektor (Musiktheater, Homer, J.H. Voss, J.W. von Goethe and H. Müller), 1987–; Medea (op, H. Müller), 1990–94; Septet (*Hektors Tod*), spkr, chbr ens, silent film; SzenePenthesileaEinTraum (op, H. von Kleist), 3 female vv, 3 male vv, spkr, actors, 27 insts, 1999–

Off-beat. Any impulse in a measured rhythmic pattern except the first (called the DOWNBEAT); the term is commonly applied to rhythms that emphasize the weak beats of the bar (ex.1). The impulse that immediately

Ex.1 Liszt: Piano Sonata

precedes – and anticipates – the downbeat of a bar is called the UPBEAT.

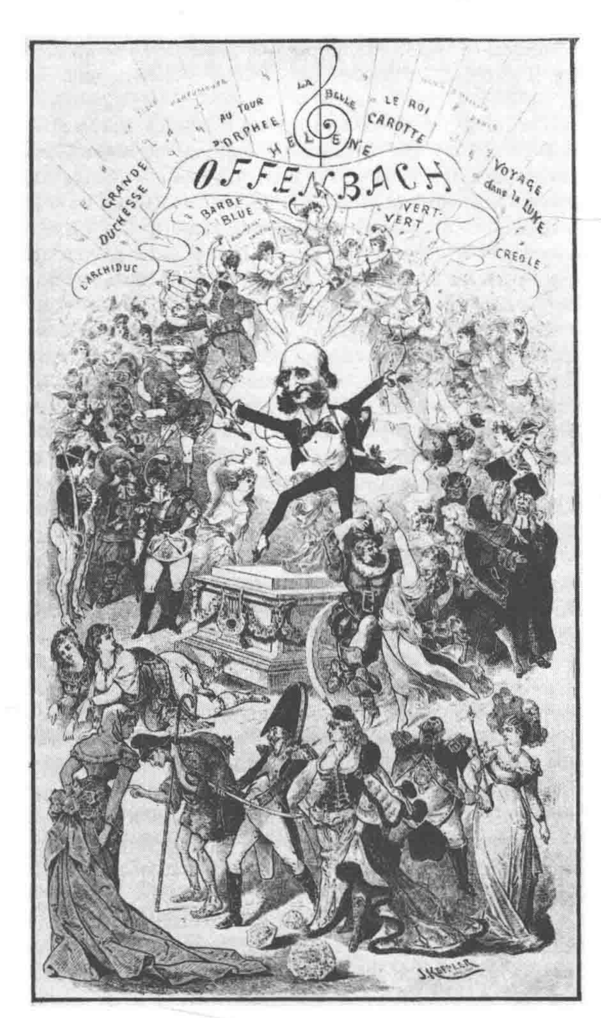
See also RHYTHM.

Offenbach, Jacques [Jacob] (*b* Cologne, 20 June 1819; *d* Paris, 5 Oct 1880). French composer of German origin. He was, with Johann Strauss (ii), one of the two composers of outstanding significance in popular music of the 19th century and the composer of some of the most exhilaratingly gay and tuneful music ever written. Offenbach's opera *Les contes d'Hoffmann* has retained a place in the

international repertory, but his most significant achievements lie in the field of operetta. *Orphée aux enfers*, *La belle Hélène*, *La vie parisienne*, *La Grande-Duchesse de Gérolstein* and *La Périchole* remain outstanding examples of the French and international operetta repertory. Moreover, it was through the success of Offenbach's works abroad that operetta became an established international genre, producing outstanding national exponents in Strauss, Sullivan and Lehár and evolving into the 20th-century musical.

1. LIFE. His father, born Isaac Juda Eberst, left his native Offenbach am Main in about 1800 for Cologne, where he became known as 'Der Offenbacher' and then simply Offenbach. He earned a living from bookbinding, music teaching and composition, and was later cantor at a synagogue in Cologne. Jacob was the second son and the seventh of ten children, and was born a short distance from the square in Cologne which today bears his name. He was first taught the violin, but at the age of nine took up the cello. With his brother Julius (1815–80) who played the violin, and sister Isabella (1817–91) at the piano he formed a trio which played in Cologne bars. He studied at first with Joseph Alexander and then with Bernhard Breuer; he dedicated his first published composition to the latter in 1833. In November of that year Isaac took Julius and Jacob to Paris in search of further tuition. There a place was obtained for Jacob at the Conservatoire, and positions were found for the two boys in a synagogue choir before Isaac returned to Cologne.

In Paris the two boys were soon known as Jules and Jacques. The latter left the Conservatoire after a year's study with Vaslin, and after brief periods with two orchestras he found a position in the orchestra of the Opéra-Comique. There he played beside Hippolyte Seligmann, and received further tuition with Seligmann's own teacher Louis Norblin. He also met Halévy, who gave him some composition lessons. In the summers of 1836 and 1837 some waltzes were performed in the Jardin Turc under Jullien, including one, *Rebecca*, on 15th-century Hebrew themes. After leaving the orchestra of the Opéra-Comique in 1838, he made the acquaintance of Flotow, through whom he gained entry to Paris salons, performing with him jointly composed pieces for cello and piano. Through contacts made in the salons he obtained pupils and also received a commission for a score for a vaudeville *Pascal et Chambord* produced in March 1839. In January 1839 he gave his first public concert with his brother Jules.



During the 1840s he continued his career as a cello virtuoso, appearing in Paris in 1841 with Anton Rubinstein and in Cologne in 1843 with Liszt. In May 1844 he visited London, performing at concerts of the Musical Union with Joachim and Mendelssohn and at an Ascot Week banquet at Windsor Castle. That August, after becoming a Roman Catholic, he married Herminie d'Alcain; he had met her at the salon of her mother, whose second husband was related to a London concert agent, John Mitchell. Meanwhile, his attempts to get stage works, including the one-act *L'alcôve*, accepted by the Opéra-Comique were unsuccessful, and he was forced to arrange concerts of his own to have them performed. His hopes of greater success with Adam's Opéra National were dashed by the Revolution of 1848, during which he temporarily returned to Cologne.

In 1850 he was appointed conductor at the Théâtre Français, but he continued to have little success in getting his stage works accepted until the Exhibition year of 1855. Then, no doubt emboldened by the success of Hervé's Folies-Nouvelles, where Offenbach's own *Oyayaye, ou La reine des îles* had been accepted, he rented for the Exhibition season the tiny wooden Théâtre Marigny in the Champs Elysées. With a hastily compiled programme of short comic pieces, the theatre opened as the Bouffes-Parisiens on 5 July. With occasional changes of programme, the entertainments were a big success of the Exhibition season, enabling Offenbach to give up his position at the Théâtre Français and transfer to winter quarters at the Théâtre Comte (Théâtre des Jeunes Elèves) in the Passage Choiseul. The following summer he moved again to the Théâtre Marigny, but from the following winter settled permanently in the Salle Choiseul.

Besides his own works his repertory embraced those of other composers, including Adam, Delibes, Duprato, Gastinel and Jonas as well as adaptations of Mozart's *Der Schauspieldirektor* and Rossini's *Il Signor Bruschino*. In 1856 his competition for young composers attracted 78 entrants: the winners were Bizet and Lecocq, with their settings of *Le Docteur Miracle*. The continuing success of the Bouffes persuaded John Mitchell to bring them to London. The entire company (including Jules Offenbach, who was leader of the orchestra) opened an eight-week season at St James's Theatre in May 1857 and also included a performance before the exiled Queen Marie-Amélie at Claremont.

Initially Offenbach's licence restricted him to pieces for only two or three stage performers, but the loosening of restrictions gradually enabled him to produce more ambitious works. The two-act *Orphée aux enfers* (1858) was a big success and the prototype of the larger-scale operettas, though for a time he continued to concentrate mainly on one-act works. In 1860 a two-act ballet *Le papillon* was produced at the Opéra and the three-act *Barkouf* at the Opéra-Comique, without giving him any greater acceptance in more respectable circles. Although he resigned as director of the Bouffes in January 1862, he continued to write mainly for that theatre and for the summer theatre at Bad Ems. In 1860 he had become a naturalized Frenchman and in August 1861 was appointed a Chevalier of the Légion d'Honneur. His family by now consisted of four daughters and a son Auguste (1862–83), and besides his Paris home in the rue Lafitte he also owned a Villa Orphée in the fashionable Normandy resort of Etretat.

His *opéras bouffes* had by now become established abroad, particularly in Vienna, at first in pirated versions and then under the composer's own direction. While he was in Vienna in 1864 his romantic opera *Die Rheinnixen* was performed at the Hofoper, and he composed a waltz *Abendblätter* in competition with the *Morgenblätter* of Johann Strauss (ii), whom he is also reputed to have encouraged to write operettas. From the same year dates the period of his greatest successes with *La belle Hélène* (1864) followed by *Barbe-bleue* (1866), *La vie parisienne* (1866), *La Grande-Duchesse de Gérolstein* (1867) and *La Périchole* (1868). During the Exhibition season of 1867 his works filled three Paris theatres, but thereafter his success began to wane. Popular taste in the musical theatre changed after the civil war of 1870–71, for much

1. 'Jacques Offenbach dirigeant la ronde frénétique de ses oeuvres': lithograph by Joseph Keppler, 1875

of the duration of which he was abroad in San Sebastian, Italy, London and Vienna.

During the 1870s it was the more escapist works of Lecocq that attracted the public, although Offenbach's own new works continued to be performed. On 1 June 1873 he took over the management of the Théâtre de la Gaîté, where he produced spectacular new versions of *Orphée aux enfers* and *Geneviève de Brabant*. But he was a poor businessman, and losses suffered on a production of Sardou's *La haine* in 1874 forced him into bankruptcy. He then composed music for a Christmas piece *Whittington* (1874) for the Alhambra in London, and in an endeavour to make up some of his losses he embarked on a trip to the USA for the Philadelphia centennial Exhibition of 1876. He gave some 40 concerts in New York and Philadelphia as well as conducting performances of *La vie parisienne* and *La jolie parfumeuse*. On his return he published a volume of his impressions of the USA.

In his last years he experienced success in London with *Madame Favart* (1878) and in Paris with *La fille du tambour-major* (1879) as well as with revivals of earlier works such as *Orphée aux enfers* with Hervé as Jupiter for the Exhibition season of 1878. However, his main preoccupation was with the score of the fantastic opera *Les contes d'Hoffmann*. During 1880 he was working on the score at the Pavillon Henri IV in Saint Germain-en-Laye, but in September worsening health forced him to return to Paris. There he died in October, the gout from which he suffered having affected his heart. At the request of his family, the score of *Les contes d'Hoffmann* was completed by Guiraud and that of an operetta *Belle Lurette* by Delibes.

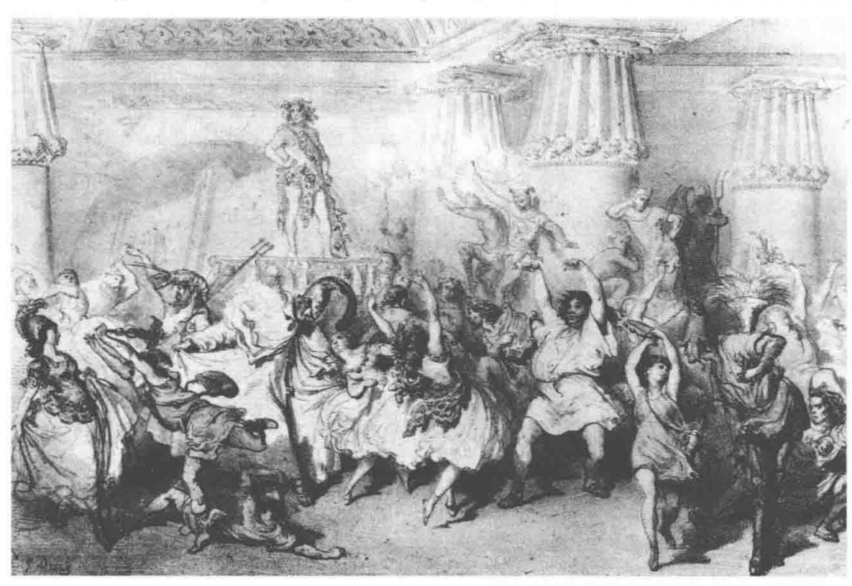
2. WORKS. As with all stage works for the genre, the success of Offenbach's operettas depended a good deal on the librettists and performers. In this respect Offenbach was both well served and skilful at discovering talent. Like Sullivan, and unlike Johann Strauss (ii), he was consistently blessed with workable subjects and genuinely witty librettos. His chief librettist, Ludovic Halévy (1834–1908), was one of the leading French theatrical writers and was given his chance at the age of 21 in writing material for the opening night of the Bouffes-Parisiens in 1855. Offenbach's leading lady, Hortense Schneider (1833–1920), who enjoyed immense personal success in *La belle Hélène*, *Barbe bleue*, *La Grande-Duchesse de Gérolstein* and *La Périchole*, was also discovered by Offenbach (and given a role in *Le violoneux* as early as August 1855), as was Zulma Bouffar, star of *La vie parisienne* and *Les brigands*.

Offenbach's sound theatrical judgment extended to his part in selecting and shaping the subjects he used. Many of these were satirical treatments of familiar tales, for example myths (*Orphée aux enfers*, *La belle Hélène*) or stories well known in France (*Geneviève de Brabant*, *Barbe-bleue*, *Robinson Crusoé*), while others satirized contemporary society and politics (*La vie parisienne* (fig.2), *La Grande-Duchesse de Gérolstein*). His one-act works include similar examples, such as *M. Choufleuri restera chez lui le . . .* which satirized Paris salons, while others were slight comic sketches such as the highly successful *Les deux aveugles*. He satirized particularly the regime of Napoleon III, and it was with the fall of Napoleon III that Offenbach's own success declined.

The humour of the pieces was rarely very subtle in purely musical terms, in keeping with the requirements of his audiences. Effect was often achieved by quoting familiar music, the satire being not so much in the treatment of the themes themselves as by introducing the themes in incongruous surroundings. Examples of such quotations are the introduction of music from *Les Huguenots* in *Ba-ta-clan*, Gluck's 'Che farò' in *Orphée aux enfers*, the patriotic trio from *Guillaume Tell* in *La belle Hélène*, and Donizetti's *La fille du régiment* in *La fille du tambour-major*. Other comic devices were the introduction of parts for animals (*Barkouf*) and the setting of gibberish (*Ba-ta-clan*). He further exploited incongruity, for example in *Orphée aux enfers* by providing a cancan for the gods, and in *La belle Hélène* by setting the phrase 'Un vile séducteur' to his most lilting waltz tune and by building up a grandiose operatic ensemble around the banal phrase 'L'homme à la pomme'. He also exploited the natural flexibility of the French language by varying accentuation, and a notable device was the breaking-up of words as in *La Périchole*:

> Aux maris ré,
> Aux maris cal,
> Aux maris ci,
> Aux maris trants,
> Aux maris récalcitrants.

2. Poster for a revival of Offenbach's 'La vie parisienne': colour lithograph by Jules Chéret, c1886



All this he backed up with simple but effective devices of a purely musical nature. His tunes are very often built upon a rising phrase and in a major key, but he achieved remarkable variety of mood by varying the rhythmic pattern. Noteworthy too is his gradual speeding-up of the finale of an act to achieve an exciting climax. His vocal writing produced outstanding lyrical examples such as the tenor's 'Au mont Ida' (*La belle Hélène*) and rumbustious comic songs such as the Gendarmes' Duet (*Geneviève de Brabant*); but when he allowed himself to break away from straightforward rhythmic patterns, he produced examples of sensitive shaping of phrases in solos written for Hortense Schneider in *La belle Hélène* and *La Périchole*.

The most individual feature of Offenbach's orchestration lies in his use of brass to heighten the impact and excitement of climaxes. He generally made effective use of wind instruments, but for much of his work he was restricted in orchestral resources and in any case he was concerned to ensure that the orchestra did not obscure the words. In fact, it is not always his own orchestration that is heard.

The well-known overture to *Orphée aux enfers*, for example, was composed on Offenbach's themes by Carl Binder (1816–60) for the Vienna production of 1860. Through this overture and particularly through the famous cancan, *Orphée aux enfers* has remained Offenbach's best-known operetta (fig.3), though a consensus as to the best of his operettas would probably prefer *La vie parisienne* for its sparkle, *La Périchole* for its charm and *La belle Hélène* for its all-round brilliance.

Offenbach's talents were often stretched by the need to work at breakneck speed to produce new works. For the same reason he often re-used material. Thus *La chanson de Fortunio* (1861), one of his best one-act works, was written around a song composed for Alfred de Musset's *Le chandelier* at the Théâtre Français in 1850. A *valse des rayons* in his 1860 ballet *Le papillon*, which reappeared in his 1864 opera *Die Rheinnixen* and in the ballet music of *Le Roi Carotte* (1872), later achieved its most familiar form when used as an apache dance for a Moulin Rouge revue in 1908. *Die Rheinnixen* also included a *Vaterland Lied* composed in Germany in 1848, and was itself the source of the music of the celebrated Barcarolle in *Les contes d'Hoffmann*.

During his lifetime Offenbach's success brought a considerable amount of disapproving comment from those who resented the 'naughtiness' of the French stage and the lack of pretence at any elevated form of art, or who considered his use of other composers' music irreverent. Wagner, whom Offenbach parodied in his revue *Le carnaval des revues* (1860), referred to 'the warmth of the dung-heap', though his attitude towards Offenbach later mellowed.

3. The Bacchanal from Offenbach's 'Orphée aux Enfers' (Act 2 scene ii of the original version), Théâtre des Bouffes-Parisiens, Paris, 1858: drawing by Gustave Doré, who designed some of the costumes for the original production (Bibliothèque et Musée de l'Opéra, Paris)

The entry on Offenbach in the first edition of Grove's *Dictionary of Music and Musicians* typified the attitude of more elevated music circles of the time, concluding that 'it is melancholy to predict that of all these musical *bouffonneries* little or nothing will remain; since in order to live, a work must possess either style or passion, whilst these too often display merely a vulgar scepticism, and a determination to be funny even at the cost of propriety and taste'.

His standing was undoubtedly helped by the success in more respectable circles of *Les contes d'Hoffmann*. The libretto, by Jules Barbier (1825–1901), was based on a play by Barbier and Michel Carré (1819–72) produced in Paris in 1851; it portrayed three stories of the author E.T.A. Hoffmann (1776–1822) as episodes of his love life. Although without the frivolous touches of the operettas, a good deal of their ready melodic appeal was carried over into the *opéra comique*, and in addition there was some powerful dramatic writing, particularly in the Antonia act (the three central acts are commonly known by the names of the heroines of the three episodes). The fact that the work is not as homogeneous as the best of the operettas may not be altogether Offenbach's fault. At his death he apparently left the work in a complete piano score, but to meet the requirements of the Opéra-Comique, Guiraud not only completed the orchestration but also added recitatives. In addition it was belatedly decided to omit the Giulietta act with some of its music hastily redistributed. The work was first published in this corrupt version, and over the years it has been subjected to all manner of further variants. In recent years, thanks largely to the conductor and musicologist Antonio de Almeida, much original material has come to light; but there can never be a definitive score of a work that Offenbach never quite completed.

The appeal of individual numbers of *Les contes d'Hoffmann* and the fantastic nature of the story has kept the work in the international opera repertory. The lack of a recognized international operetta tradition formerly meant that revivals of the operettas were less regular. The best tunes, however, retained their wide popularity, particularly through their use in the score arranged by Manuel Rosenthal for Leonid Massine's ballet *Gaîté parisienne* for the Ballets Russes de Monte Carlo in 1938. More recently, the greater attention paid to the classical operetta since World War II has made the best of Offenbach's operettas familiar again and permitted fuller appreciation of his standing as the supreme master of the genre.

WORKS

all first performed and published in Paris, unless otherwise stated

OPERETTAS AND OPÉRAS COMIQUES

L'alcôve (1, P. Pittaud de Forges, A. de Leuven and E.-G. Roche), Tour d'Auvergne, 24 April 1847
Le trésor à Mathurin (1, L. Battu), Salle Herz, 7 May 1853; rev. as Le mariage aux lanternes (J. Dubois [M. Carré], and Battu), BP, 10 Oct 1857
Pépito (1, J. Moinaux and Battu), V, 28 Oct 1853
Luc et Lucette (1, Pittaud de Forges and Roche), Salle Herz, 2 May 1854
Entrez, messieurs, mesdames (prol, F.-J. Méry and J. Servières [L. Halévy]), BPSM, 5 July 1855
Les deux aveugles (1, Moinaux), BPSM, 5 July 1855
Une nuit blanche (1, E. Plouvier), BPSM, 5 July 1855
Le rêve d'une nuit d'été (1, E. Tréfeu), BPSM, 30 July 1855
Oyayaye, ou La reine des îles (1, Moinaux), Folies-Nouvelles, 7 Aug 1855
Le violoneux (1, E. Mestépès and E. Chevalet), BPSM, 31 Aug 1855
Madame Papillon (1, J. Servières [Halévy]), BPSM, 3 Oct 1855
Paimpol et Périnette (1, Pittaud de Forges), BPSM, 29 Oct 1855
Ba-ta-clan (1, Halévy), BP, 29 Dec 1855
Un postillon en gage (1, J. Adenis), BP, 9 Feb 1856
Trombalcazar, ou Les criminels dramatiques (1, C.D. Dupeuty and E. Bourget), BP, 3 April 1856
La rose de Saint-Flour (1, Carré), BPSM, 12 June 1856
Les dragées du baptême (1, Dupeuty and Bourget), BPSM, 18 June 1856
Le '66' (1, Pittaud de Forges and M. Laurencin [P.A. Chapelle]), BPSM, 31 July 1856
Le financier et le savetier (1, Crémieux and E. About), BP, 23 Sept 1856
La bonne d'enfants (1, E. Bercioux), BP, 14 Oct 1856
Les trois baisers du diable (1, Mestépès), BP, 15 Jan 1857
Croquefer, ou Le dernier des paladins (1, A. Jaime and Tréfeu), 12 Feb 1857
Dragonette (1, Mestépès and Jaime), BP, 30 April 1857
Vent du soir, ou L'horrible festin (1, P. Gille), BP, 16 May 1857
Une demoiselle en lôterie (1, Jaime and Crémieux), BP, 27 July 1857
Les deux pêcheurs (1, Dupeuty and Bourget), BP, 13 Nov 1857
Mesdames de la Halle (1, A. Lapointe), BP, 3 March 1858
La chatte metamorphosée en femme (1, Scribe and Mélesville), BP, 19 April 1858
Orphée aux enfers (2, Crémieux and Halévy), BP, 21 Oct 1858; rev. (4), G, 7 Feb 1874
Le mari à la porte (1, A. Delacour), BP, 22 June 1859
Les vivandières de la grande armée (1, Jaime and Pittaud de Forges), BP, 6 July 1859
Geneviève de Brabant (2, Jaime and Tréfeu), BP, 19 Nov 1859; rev. (3, Crémieux), Menus-Plaisirs, 26 Dec 1867 (5, Crémieux), G, 25 Feb 1875
Le carnaval des revues (1, E. Grangé, Gille and Halévy), BP, 10 Feb 1860
Daphnis et Chloé (1, Clairville [L.F. Nicolaie] and J. Cordier [E.T. de Vaulabelle]), BP, 27 March 1860
Barkouf (3, Scribe and H. Boisseaux), OC, 24 Dec 1860
La chanson de Fortunio (1, Crémieux and Halévy), BP, 5 Jan 1861
Le pont des soupirs (2, Crémieux and Halévy), BP, 23 March 1861; rev. (4), V, 9 May 1868
M. Choufleuri restera chez lui le . . . (1, Saint-Rémy [Duc de Morny], E. L'Epine, Crémieux and Halévy), Présidence du Corps Législatif, 31 May 1861, BP, 14 Sept 1861
Apothicaire et perruquier (1, E. Frébault), BP, 17 Oct 1861
Le roman comique (3, Crémieux and Halévy), BP, 10 Dec 1861
Monsieur et Madame Denis (1, Laurencin [Chapelle] and M. Delaporte), BP, 11 Jan 1862
Le voyage de MM. Dunanan père et fils (3, P. Siraudin and Moinaux), BP, 22 March 1862
Les bavards [Bavard et bavarde] (2, Nuitter, after Cervantes: Los habladores), Bad Ems, 11 July 1862, Vienna, Kaitheater, 20 Nov 1862, BP, 20 Feb 1863
Jacqueline (1, P. d'Arcy [Crémieux and Halévy]), BP, 14 Oct 1862
Il Signor Fagotto (1, Nuitter and Tréfeu), Bad Ems, 11 July 1863, BP, 13 Jan 1864
Lischen et Fritzchen (1, P. Dubois [P. Boisselot]), Bad Ems, 21 July 1863, BP, 5 Jan 1864
L'amour chanteur (1, Nuitter and E. L'Epine), BP, 5 Jan 1864
Die Rheinnixen (3, A. von Wolzogen, after Nuitter), Vienna, Hofoper, 4 Feb 1864
Les géorgiennes (3, Moinaux), BP, 16 March 1864
Le fifre enchanté, ou Le soldat magicien (1, Nuitter and Tréfeu), Bad Ems, 12 July 1864, BP, 30 Sept 1868
Jeanne qui pleure et Jean qui rit (1, Nuitter and Tréfeu), Bad Ems, 19 July 1864, BP, 3 Nov 1865
La belle Hélène (3, H. Meilhac and Halévy), V, 17 Dec 1864
Coscoletto, ou Le lazzarone (2, Nuitter and Tréfeu), Bad Ems, 11 July 1865
Les refrains des bouffes (1), BP, 21 Sept 1865
Les bergers (3, Crémieux and Gille), BP, 11 Dec 1865
Barbe-bleue (3, Meilhac and Halévy), V, 5 Feb 1866

La vie parisienne (5, later 4, Meilhac and Halévy), PR, 31 Oct 1866
La Grande-Duchesse de Gérolstein (3, Meilhac and Halévy), V, 12 April 1867
La permission de dix heures (1, Mélesville [A.H.J. Duveyrier] and P.F.A. Carmouche), Bad Ems, before 20 July 1867, R, 4 Sept 1873
La leçon de chant (1, E. Bourget), Bad Ems, 20 July 1867, Folies-Marigny, 17 June 1873
Robinson Crusoé (3, E. Cormon and Crémieux, after D. Defoe), OC, 23 Nov 1867
Le château à Toto (3, Meilhac and Halévy), PR, 6 May 1868
L'île de Tulipatan (1, H. Chivot and A. Duru), BP, 30 Sept 1868
La Périchole (2, Meilhac and Halévy), V, 6 Oct 1868, rev. (3), V, 25 April 1874
Vert-vert (3, Meilhac and Nuitter), OC, 10 March 1869
La diva (3, Meilhac and Halévy), BP, 22 March 1869
La princesse de Trébizonde (2, Nuitter and Tréfeu), Baden-Baden, 31 July 1869, rev. (3), BP, 7 Dec 1869
Les brigands (3, Meilhac and Halévy), V, 10 Dec 1869, rev. G, 26 Dec 1878
La romance de la rose (1, Tréfeu and J. Prével), BP, 11 Dec 1869
Boule de neige (3, Nuitter and Tréfeu), BP, 14 Dec 1871; rev. of Barkouf

Offerenda. Mass chants in the Ambrosian rite, corresponding to the Roman offertories. *See* AMBROSIAN CHANT, §7(i), and OFFERTORY, §3.

Offererius. *See* UFFERERII, GIOVANNI DAMASCENI.

Offertory [offertorium, offerenda]. A chant of the Western Mass rites sung while bread and wine are prepared for eucharistic consecration. It is also the post-medieval name for the complex of priestly prayers and ritual actions (mixing of wine and water, incensation, washing of the hands) that took place during this part of the Mass. In its full medieval form the offertory chant consisted of a choral refrain in richly neumatic style with two or three neumatic–melismatic verses sung by a soloist. The latter part of the refrain (known as the *repetendum*) was repeated after each verse. Related to the offertory of the Roman Mass are the Ambrosian *offerenda*, the Mozarabic *sacrificium* and the Gallican *sonus*.

1. Origin and early history. 2. Offertories of Old Roman and Gregorian chant. 3. Other rites. 4. Post-medieval developments.

1. ORIGIN AND EARLY HISTORY. The earliest descriptions of the Mass (Justin Martyr, Hippolytus) do not single out the placing of bread and wine on the altar as an important ritual event surrounded by prayers and singing. Although nothing is known about the origins of the offertory, it was presumably introduced into the Mass after the gradual, communion and introit chants. The widespread view that Augustine's allusion (*c*400) to a Carthaginian practice of singing 'hymni ad altare . . . ante oblationem' refers to singing at the offertory can no longer be maintained. Augustine defended the practice in a lost tract *Contra Hilarem*, but its exact nature cannot now be ascertained. The earliest reference to singing at this point in the liturgy might be a statement (before 620) by Isidore of Seville about 'Offertoria quae in sacrificiorum honore canuntur' (*De ecclesiasticis officiis*, i.14; *PL* lxxxiii, 751, cf lxxxiii, 896), if this is not actually a reference to music during Jewish Temple sacrifices. Some medieval commentators on the liturgy viewed such Jewish ritual music as prefiguring the Christian offertory chant, although Walafrid Strabo (*c*831) believed that the early Christians made their offerings in silence (*Liber de exordiis et incrementis*, xxiii).

The earliest reference to singing at this point during the Roman Mass occurs in *Ordo Romanus I*, a description of the papal Mass at about the turn of the 8th century. By this time an elaborate ritual already surrounded the reception of bread and wine from members of the Roman aristocracy by the pope and his retinue. It is not entirely clear whether ordinary members of the congregation participated. The offertory chant (*offertorium*) is mentioned only when the pope gives the Schola Cantorum a signal that it should be brought to a conclusion (*Ordo I*, 85; Andrieu, ii, 95). (*Ordo Romanus I* also calls the veil used to hold the handles of the large chalice into which offerings of wine were poured an 'offertorium'.) Nothing can be known about the form or musical style of the offertory chant at this period, save that its length could be adjusted to cover the time it took to gather the offerings. Before the end of the 8th century a visitor to Rome who made random observations about the Lenten liturgy thought the verse(s) worthy of mention (*Ordo XXII*, 21; Andrieu, iii, 262), something he would not have done were these set to a simple psalm tone. Three of

the earliest unnotated *gradualia* from the 9th century (Mont-Blandin, Compiègne, Senlis) contain two or three verses for most offertories, and the Gallicanized episcopal Mass described in *Ordo Romanus V* (late 9th century) notes specifically that during the people's offering 'cantores cantant offertorium cum versibus'.

It has been claimed that the offertory was originally an antiphonal chant associated with psalmody, like the other 'processional' chants of the Mass – the introit and communion. This analogy rests in part on the assumption that a lay procession to the sanctuary for the presentation of bread and wine (and possibly other offerings) constituted an original element of the ceremony. Early evidence for a procession of this type at Rome is non-existent. It might have been a Carolingian contribution to the liturgy, but the extent to which the laity customarily made a solemn liturgical presentation of their offerings at Mass during the Middle Ages has yet to be clarified. Certain lavish donations to the church (precious sacred vessels or property) might have been carried in procession and placed on the altar during the offertory of the Mass.

Those who defend the theory of an antiphonal origin claim that the offertory chant later became a responsorial chant with melodically developed refrain and verses. In an attempt to determine when this might have happened, Apel noted that Aurelian of Réôme claimed that 'the verses of the offertories are inserted in them *per tonos*' (*Musica disciplina*, x.12; ed. L. Gushee, CSM, xxi, 1975, p.87). Apel construed Aurelian's statement to mean that the verses were sung to standard 'offertory tones' in the mid-9th century, and he concluded that their absence in the tonary compiled by Regino of Prüm (915) was proof that the 'tones' had been discarded in favour of freely composed verses. Even though the offertories are listed in Aurelian's 'deuterologium tonorum', this is merely for the sake of an inclusiveness typical of the 'theoretical' tonaries. Neither the theorists of the Middle Ages nor any of the anonymous tonaries or medieval liturgical manuscripts consider the offertories anything other than responsorial chants. An antiphonal origin seems out of the question.

2. Offertories of Old Roman and Gregorian chant. The period during which new offertories were composed at Rome may have ended as early as the 8th century. When the Thursdays of Lent, hitherto deprived of Mass liturgies, were given their own Mass formularies by Pope Gregory III (715–31), pre-existing chants supplied all of the needed offertories. *Ad te levavi*, assigned to the Thursday after Ash Wednesday, is sung on Wednesday in the second week of Lent, on the tenth Sunday after Pentecost and on the first Sunday of Advent. In addition, about two dozen other medieval offertories are sung on more than one occasion. Feasts of saints of the same category (martyr, bishop) often share a common offertory. In a few cases offertory melodies have been adapted to different texts: *Viri Galilei* was reused for the offertories *Stetit angelus*, *Iustorum anime* and *Erue me*. The verses might not have been sung everywhere or necessarily in the same order; they fell out of general use by the 13th century. Not infrequently, they were transmitted in separate collections along with tropes and prosulas (*see* Sources, ms, §II, 3).

Most offertories in the Old Roman and Gregorian repertories draw their texts from the Book of *Psalms* (*see* Psalter, liturgical). In a study of the 107 offertory texts contained in the *Antiphonale missarum sextuplex* Hucke (1970) demonstrated the prevalence of two text types: (1) both refrain and verses freely selected from psalm verses not in the order of the Psalter; (2) the refrain selected from an interior psalm verse and the verses of the offertory from the beginning of the psalm. According to Hucke, these text types presuppose a responsorial, not an antiphonal, manner of performance. 18 Gregorian offertories have non-psalmic texts, 12 of which occur in Old Roman chant as well. Levy (1984) described these texts as 'librettos' specifically designed for a florid musical setting, and, on the basis of textual and musical parallels, he pointed towards Gaul as the source of the texts and possibly of aspects of their musical settings in the Mozarabic, Gregorian and Ambrosian repertories. The existence of these relationships would push the history of the offertory back to about 700.

Frequently, the texts of the Old Roman and Gregorian offertories were chosen for their close connection with the Gospel pericope or the introit of the day. *Iustitie Domini* for the third Sunday in Lent (ex.1) has a refrain pieced together from parts of three verses of Psalm xviii (xix), verses *9a*, *11b*, and *12a*. The Gospel of the day concludes with Jesus's proclamation that they are blessed who hear the word of God and keep it ('et custodiunt illud'). The offertory refrain closes with a similar phrase: 'for your servant keeps them' ('nam et servus tuus custodiet ea'). (The neuter plural 'ea' refers to the words 'iudicia eius', omitted by the compiler of the offertory text. The Cistercian and Dominican revisers of the chant inserted these words before 'dulciora' and supplied music for them.) The words 'illuminans oculos' ('illuminating the eyes') in the first verse of the offertory allude to the first words of the introit for this Sunday, *Oculi mei semper ad Dominum*.

Although the Gregorian offertory repertory is distinctive because each chant is unique, *Iustitie Domini* (ex.1) may serve as an adequate representation. The asterisk at the beginning of the second line of the refrain indicates the beginning of the *repetendum*. This phrase makes good textual sense following the first verse but links less satisfactorily with the second. The range of the refrain (*c–a*) and its concentration on *f* is entirely consistent with chants in mode 4, to which this piece was assigned by the *Graduale romanum*, although some medieval traditions assigned it to mode 6 with a final cadence on F. Verse 1 initiates the curve of intensification characteristic of the offertory chants. It breaks away from *f* and moves to the upper third, *a–c′* returning to *f* as a focal point in the last phrase, thus forming a smooth link with the *repetendum*. The first phrase of verse 2 explodes into the expansive lyricism encountered frequently in the Gregorian offertory verses. The insistence on a single pitch (here, *c′*) in the long final melisma also represents a distinctive feature of the repertory. Some melismas have repetition patterns (*aab*, *abb*), and the final melisma could be provided with a Prosula.

The Old Roman offertories (transcribed by Landwehr-Melnicki) have generally the same textual basis as their Gregorian counterparts. From a structural point of view, however, they differ significantly. They make extensive use of the repetition and artful recombination of phrases, long and short, and approximately two thirds of the repertory (59 of 94 offertories) makes greater or lesser use of two formulae (Dyer, 1998). The first of these (ex.2*a*, formula A, a formula with four elements that is

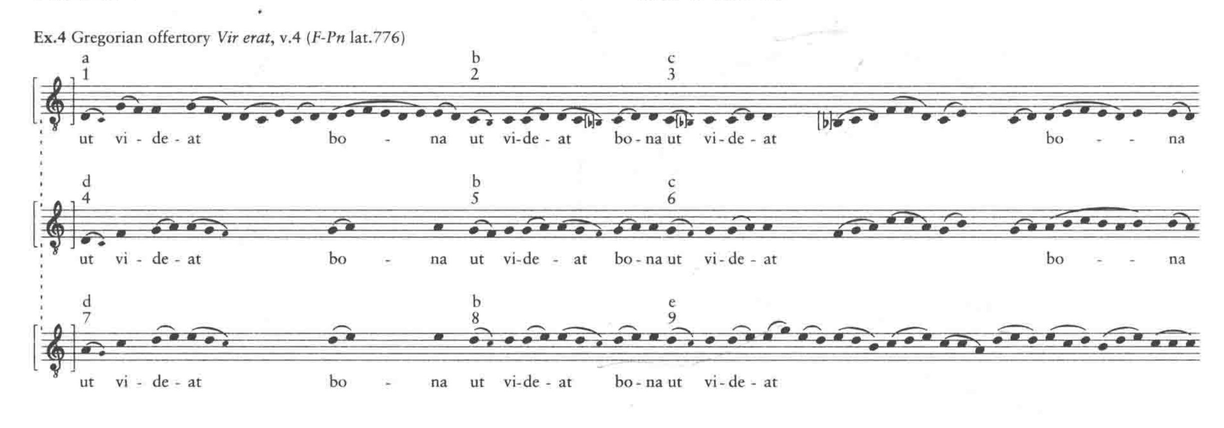
most often associated with E-mode offertories and verses, has as its most prominent feature a torculus (*b–c′–a*) that can be repeated several times to accommodate texts of varying lengths. The second formula consists of seven elements (ex.2*b*, formula B). Though found most frequently with F-mode offertories, it pervades a larger part of the offertory repertory than does the first formula. Allusions to this formula in the Old Roman offertory *Iustitie Domini* (ex.3) are indicated by brackets above the stave.

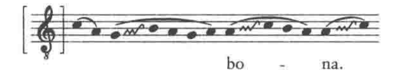
Certainly the most peculiar, and hitherto inexplicable, aspect of the Old Roman and Gregorian offertories is the presence of text repetition, found in 14 Old Roman and 13 Gregorian offertories. This can take two forms: (1) the immediate repetition of a text phrase, either with the same or slightly altered music (*AA*), or (2) the return of the first phrase of the refrain at its end (*ABA*). None of the various explanations proposed to account for this practice, unique to the offertory, has found general acceptance. The most extraordinary instance of repetition

Ex.2 Old Roman offertory reciting tones.

Ex.3 Old Roman offertory *Iustitie Domini*, refrain (*CH-CObodmer* C.74)



in the Old Roman and Gregorian offertories occurs in verse 4 of *Vir erat* (ex.4, transcribed by Ruth Steiner from the clefless but diastematic manuscript *F-Pn* lat.776), a text from the book of *Job*. In it 'ut videat/videam bona' is repeated nine times, although not all manuscript sources agree on the number of repetitions. As in *Iustitie Domini*, a gradual increase of tension may be observed in *Vir erat*: the first line hovers around *d*; the second group of repetitions moves a fifth higher to *a*; and the climax is reached with the last three anguished cries of the distressed Job. Each group of phrases closes with a melodically expanded variation of the first two sub-phrases.



3. OTHER RITES. A large number of Mozarabic *sacrificia* are preserved, but only in staffless neumes that cannot be transcribed. Most of the texts are non-psalmic, though drawn from the Hebrew scriptures or the gospels (listed with sources in Randel, 457–71). Many of the texts refer to offering and sacrifice. Like the Old Roman and Gregorian offertory, the Mozarabic *sacrificium* consists of a refrain followed by several verses separated from each other by a *repetendum*. The musical style is prevailingly florid, thus making it regrettable that the corpus of what one authority has called 'the most prodigious chant in the old Spanish liturgy' cannot be recovered.

Evidence for the Gallican *sonus*, if this chant was indeed the equivalent of the Roman offertory, is far more tenuous. The account of the Gallican liturgy attributed to St Germanus (*d* 576), but probably written in Burgundy in the early 8th century, describes a solemn procession during which members of the clergy transfer bread and wine from the sacristy to the altar. The singing of the *sonus*, concluded by a triple alleluia, accompanied this procession. *Ordo Romanus XV* describes a similar ceremony accompanied by the singing of the antiphon *Laudate Dominum de celis*, to which a response is made. The author then continues: 'after this the clergy at once sing the offerenda, which the Franks call "sonus"' (*Ordo XV*, 134–44; Andrieu, iii, 122–3). With the possible exception of a few texts (see above) the Gallican repertory has been lost.

Many of the Milanese (Ambrosian) offertories (*offerendae*) are related to Gregorian offertories but there are fewer verses present in the repertory. Most of the texts are psalmic, although a number of Ambrosian offertories share the non-psalmic 'libretto' texts that might have a Gallican origin. The Ambrosian offertory refrains manifest about the same level of melodic elaboration as their Gregorian equivalents. They have notable melismas, sometimes even at the beginning of the refrain, as in *Haec dicit Dominus*.

Ex.4 Gregorian offertory *Vir erat*, v.4 (*F-Pn* lat.776)

letters above stave indicate motivic structure
figures above stave indicate phrase repetitions

4. Post-medieval developments. As the sense of liturgical integrity weakened, the singing of the proper chant offertories declined. Polyphonic settings of the offertory were neglected during the Renaissance, possibly because the florid melodies of the chant offertories did not lend themselves to cantus firmus treatment (see Lipphardt). The 68 offertories for five voices in Palestrina's superb collection, *Offertoria totius anni* (1593), make use of freely invented motifs. Lassus had earlier published polyphonic offertories in two collections entitled *Sacrae cantiones* (1582 and 1585).

During the 17th and 18th centuries settings of the offertory texts were adapted to current modes of musical expression, although *stile antico* polyphony was not entirely abandoned. In Germany the offertory took on the aspect of an orchestrally accompanied cantata with recitatives, arias and instrumental movements, and the traditional offertory texts sometimes yielded to newly composed poetry. Symphonic movements also found a place at the offertory. French organ masses included an *offertoire*, a form that reached grand proportions in François Couperin's *Pièces d'orgue consistantes en deux messes* (1690). Italian organ composers wrote spirited *offertori* for this point in the liturgy.

The musical treatment of the offertory ('offering') in contemporary Christian churches varies widely. If a choir is present, an anthem with a text relating to the prescribed liturgy of the day or theme of the service can be performed, a role that might also be filled by a vocal soloist. Organ or instrumental music, or a hymn sung by the congregation, are other alternatives. When the offerings have been gathered, they (along with bread and wine, if the Eucharist is to be celebrated) are brought forward with a certain degree of ceremony. The congregation then sings an appropriate brief sentence or a stanza of a hymn. 'Praise God from whom all blessings flow', sung to the tune 'Old Hundredth', serves this purpose in many Protestant churches of the English-speaking world. Some service books provide other musical options, such as 'What shall I render' and 'Let the vineyards be fruitful' in the American *Lutheran Book of Worship*.

Ofterdingen, Heinrich von. *See* HEINRICH VON OFTERDINGEN.

Ó Gallchobhair, Éamonn [O'Gallagher, Eamonn] (*b* Dundalk, 30 Sept 1906; *d* Spain, 27 Dec 1982). Irish composer. He studied in Dublin at the Leinster School of Music and the Royal Irish Academy of Music. His strong personality led to a varied succession of appointments. He served as the music director at the Abbey theatre, conducted Radio Éireann's Light Orchestra and later became a member of the station's music staff. A leading advocate for the development of a distinctive Irish school of composition, he devoted considerable energy as a critic to combating in writing those who argued for a broader compositional outlook.

An active composer in smaller forms, Ó Gallchobhair wrote in a determinedly nationalistic musical style. The structures and harmonies of traditional music strongly inform his works. Five operas survive, all of which are in Irish. Many of his choral and solo vocal works also set Gaelic texts. His sacred works include mass settings and a short *St John Passion* for male voices (1950). Among his most expressive compositions are the *Three Aquarelles* (1952), orchestral complements to watercolours painted by his wife, Mollie Ó Gallchobhair. He also wrote a considerable body of incidental music for productions at the Abbey theatre and scores for films and documentaries.

WORKS
(*selective list*)

Dramatic: The Singer (ballet, 3 scenes, Ó Gallchobhair, after P. Pearse, choreog. D. Forrest), 1935; Paul Henry-Landscape (ballet, 1 scene, Ó Gallchobhair, choreog. Forrest), 1937; The Twisting of the Rope (ballet, 1 scene, Ó Gallchobhair, choreog. Forrest), 1939; Nocturne sa Chearnóg (op, 3), 1942; Trághadh na Taoide (op, 3, T. Ó Coileáinn), 1950; Ioc-Shláinte an Ghrá (op, 3), 1954; An Mhaighdean Mhara (op, 1, Ó Coileáinn), 1960; An Tinncéir agus an tSidheóg (op, 1), 1963; incid music; film scores

Orch: Sreath Fonn, ob, str orch, 1940; Homage to Mangan, 1950; Three Aquarelles, 1952; Fl Conc., fl, str orch, 1960; Air and Variations, 1962

Choral: Mouth Music, 1930; St John Passion, male chorus, 1950; Tháinig na Salithe, SSATB, 1950; St Colmcille Mass, 1971

Principal Publisher: Govt. Pubns [Dublin]

Oganesyan, Edgar Sergeyi. *See* HOVHANESIAN, EDGAR SERGEYI.

Oganezashvili, Sasha [Oganyan, Aleksandr] (*b* Soganlug, Georgia, 1889; *d* Tbilisi, 31 May 1932). Armenian *k'emanch'a* player, teacher, theorist and composer. He began to play the *k'emanch'a* at the age of seven and joined a *sazander* ensemble in which he played the *tiplipito* and the *duduk* as well as the *k'emanch'a*. He became a soloist in the composer Anton Mailian's Eastern Orchestra in Baku in 1905 and often appeared with the instrumental *ashugh* group Haziri in Tbilisi. In the same year he toured the Transcaucasian region, Central Asia and Iran with two *mugam* performers, the singer D. Karyagdogli and the *t'ař* player K. Pirimov. During the period 1906–12 recordings of his performances of classical *mugam* and Armenian dance music were released by the companies Kontzert-Rekord, Patye and Sport-Rekord. He studied the *k'emanch'a* with Oganez Oganezov, an authority on the Persian *mugam*, and took the pseudonym Oganezashvili ('son of Oganez') in his honour; Oganezashvili added a fourth string to the *k'emanch'a*, which significantly widened its range and thereby increased its potential as a solo instrument.

In 1920 he became the first rector of the Eastern Conservatory in Baku, which taught the theory of eastern music and eastern folk-instrument playing. He began to teach the *k'emanch'a* and music theory in Tbilisi in 1924, and in 1926 he founded a Faculty of Eastern Music at the Yerevan Komitas State Conservatory, at the same time directing and performing as a soloist with the Ensemble of Folk Instruments of Radio Armenia. His students included the *k'emanch'a* players and composers Guzgen Mirzoian and Aram Merangulian. During the late 1920s Oganezashvili worked in the Ton archive in Berlin and took part in the World Exhibition in Frankfurt (1927). He also wrote a series of articles about the monodic musical culture of the Transcaucasus and Iran. His compositions include *Farkhad i Shirin* (1911) and pieces for *k'emanch'a*s, violin and piano.

ALINA PAHLEVANIAN

Ogdon, John (Andrew Howard) (*b* Mansfield Woodhouse, Notts., 27 Jan 1937; *d* London, 1 Aug 1989). English pianist and composer. His first serious piano study was at the Royal Manchester College of Music in 1945 with Iso Elinson. Later teachers included Claud Biggs and Egon Petri, Richard Hall and George Lloyd. As a student he gave the premières of works by Goehr, Maxwell Davies and himself as part of the Manchester New Music Group. He first attracted attention in 1958 when at short notice he replaced an indisposed soloist in Liverpool and performed Brahms's Second Concerto almost at sight. Later that year in the same city he gave the first of his many performances of Busoni's Concerto with a mastery that astounded the audience. His London recital début in 1959 was equally memorable, so complete was his technical command, so refreshing and true his interpretative imagination. He first appeared at the Proms later that year. In 1960 he gained the Busoni Prize and the following year received the Liszt Prize in London. In 1962 he shared with Vladimir Ashkenazy the coveted first prize in the Moscow Tchaikovsky Competition, an achievement that launched his international career.

Ogdon's vast repertory and recorded legacy embraced almost every imaginable aspect of pianism. Already well known for performing popular Classical and Romantic masterpieces and an astonishing variety of 20th-century music, he went on to champion important and lesser-known music from past and present, most notably Alkan, Liszt and Busoni and many of his own contemporaries and compatriots, giving numerous first performances

along the way and making many notable recordings. He also gave many duet recitals with Brenda Lucas, whom he married in 1960. A prolific composer, especially of keyboard music, he saw the act of composition as an indispensable part of his overall musical development which influenced his approach to performance. No pianistic challenge proved too much for him; his capacity to absorb substantial works at a glance has already passed into legend and helped him conquer peaks of piano literature hitherto considered unscalable. Modest in demeanour, economical and undemonstrative in his keyboard manner, he was, like most great pianists, a sympathetic chamber musician and accompanist; at the same time his colossal range and control of dynamics, digital brilliance and seemingly limitless resources of physical stamina enabled him to unleash torrents of virtuosity with ease, although always at the service of the music. A widely read man of profound intellect who never took any repertory for granted, he often wrote copious notes about pieces; he even arrived at one recording session clutching his substantial essay on Chopin's G minor Ballade.

During the 1970s he suffered increasingly from mental illness which was eventually diagnosed as schizophrenia. The most outstanding achievement of his final years, when his condition was largely stabilized, was his recording and performance of Sorabji's massive *Opus clavicembalisticum*. To hold an entire audience's attention throughout more than four hours of almost unremitting complexity relieved only by transcendental virtuosity is a tribute to Ogdon's unique genius as well as to the emotional and intellectual power of Sorabji's music. At recording sessions for this work he generally chose to warm up with Busoni's *Fantasia contrappuntistica*; the four-CD boxed set which was released a few months after Sorabji's death has come to be regarded as the crowning glory of Ogdon's career. His own death a few weeks later, at the age of only 52, robbed the musical world of one of the most remarkable figures in the history of piano playing. Ogdon's compositions, many in manuscript and some incomplete, are detailed in S. Atman: *The Compositions of John Ogdon: a Catalogue* (MS, 1990). A substantial collection of his manuscripts is held at the RNCM, Manchester.

Ogier. *See* HOGER DE LAON.

Ogilby [Ogelby, Oglivie], **John** (*b* north of Dundee, Angus, Nov 1600; *d* London, 4 Sept 1676). Scottish dancing-master, theatrical impresario, writer, publisher and possibly composer, active partly in Ireland. A man of extraordinary versatility who was adept at attracting influential patronage, he successfully survived many misfortunes. His career began as a dancer at the court of Charles I. After a fall during a court masque in 1621 he was forced to give up dancing and became a dancing master and choreographer. About 1633 he accompanied the Duke of Wentworth (later the Earl of Strafford) to Dublin. He is important in the history of music in Ireland as the first holder there of the title of Master of the Revels, a position created for him by the Earl as Lord Deputy on 28 February 1638. In this capacity he erected in Werburgh Street, close to Dublin Castle, the first theatre to be built in the British Isles outside London. On the outbreak of the Civil War in 1641 his theatre was closed and soon fell into ruin, and he returned destitute to England shortly after. He then turned to translating the classics, including Virgil, Aesop and Homer, and established a profitable publishing business in London issuing both his translations and travel books.

After the Restoration he attracted the attention of Charles II and outmanoeuvred William Davenant in obtaining once again, on 8 May 1661, the monopoly of theatrical interests in Ireland and immediately built the Smock Alley Theatre, which was opened in the autumn of 1662 and survived until 1787. There is evidence that he was at least to some extent versed in musical composition, since the libretto of the musical play *Pompey* by Mrs Philips, which was performed at the Smock Alley Theatre on 10 February 1663, states that the play concluded with 'a Grand Masque Danc'd before Caesar and Cleopatra made as well as the other Dances and the Tunes to them by Mr John Ogilby'.

BRIAN BOYDELL

Oginaga, Joaquin de. *See* OXINAGA, JOAQUÍN DE.

Ogiński. Polish family of musicians.

(1) Michał Kazimierz Ogiński (*b* Warsaw, 1728; *d* Warsaw, 31 May 1800). Prince, Grand Hetman of Lithuania, musician and poet. In his youth he spent seven years in France, first at the court of Stanisław Leszczyński at Lunéville and then in Paris. He was taught the violin by G.B. Viotti, and also learnt the clarinet and harp. His improved harp pedal system was adopted in 1762 by the firm of Erard in Paris; he wrote the article on the harp for Diderot's *Encyclopédie* (Paris, 1765). From 1771 Ogiński maintained an opera company with ballet and orchestra at his residence at Słonim, Lithuania; it had a large repertory of Polish, Italian, French and German operas and symphonies. He founded a school for local children, who in 1777 acted Rousseau's *Pygmalion* in French at his second theatre at Siedlce, near Lublin. Ogiński's compositions include several operas and songs (for which he also wrote the texts), a ballet celebrating the anniversary of the coronation of Stanisław August (Warsaw, 24 November 1765; now lost) and several polonaises and mazurkas.

WORKS

Spl (librettos by the composer, first performed Słonim, unless otherwise stated): Filozof zmieniony [The Transformed

Philosopher], 1771, *PL-Wn*; Opuszczone dzieci [The Forsaken Children], 1771, *WRzno*; Kondycje stanów [The Social Position of the Classes], 1781, *Wn*; Pola Elizejskie [The Elysian Fields], 1781, *Wn*; Cyganie [The Gypsies] (F.D. Kniaźnin), Siedlce, 1786; Mocy Świata [The Powers of the World], before 1788, *Wn*

26 songs: 12 without acc., 1770, *Wn*; 14, acc. 2 vn, b, in *Bajki i Niebajki*, i–ii (Warsaw, 1788)

Inst: 3 National Polonaisen, pf 4 hands (Berlin, n.d.); Polonaise, G, vn, pf, ed. in *Kurier Warszawski* (1902), no.1; others, *Wtm*

(2) **Michał Kleofas Ogiński** (*b* Guzów, nr Warsaw, 25 Sept 1765; *d* Florence, 15 Oct 1833). Composer, nephew of (1) Michał Kazimierz Ogiński. He first studied the violin and piano at Guzów with Józef Kozłowski (1773–8); later he took occasional violin lessons from Viotti (1798), Baillot (1810) and others. From 1789 he held various ambassadorial and governmental positions in the Netherlands (1790), London (1791), Warsaw (as Grand Treasurer of Lithuania, 1793–4), Constantinople (1796) and elsewhere. He travelled throughout Europe, settling in 1802 at Zalesie, near Vilnius, and in 1815 in Italy.

Ogiński is chiefly noted for his piano works, particularly the polonaises, the melancholy, lyrical mood of which suited the taste of the times and expressed Polish patriotism. Many contemporary composers such as Elsner, Kurpiński and Szymanowska were influenced by his works in this form. Ogiński wrote about 20, published in many editions in Poland and abroad, the best known being *Pożegnanie Ojczyzny* ('Farewell to the Fatherland'). His vocal works include an opera and many songs; a number of patriotic songs written for the Polish regiment he maintained in the early 1790s are now lost.

WORKS

Pf 2–4 hands: *c*20 polonaises, incl. 'Les adieux' (Warsaw, 1803), Pożegnanie Ojczyzny [Farewell to the Fatherland] (n.p., 1831); mazurkas, waltzes, marches, incl. Marche pour les légions polonaises en 1797 (Leipzig, 1825); Menuet, *PL-Kj*

Vocal: Zélis et Valcour ou Bonaparte au Caïre (op, 1, Ogiński), 1799, *Kj*; 13 romances (It., Fr.); 2 songs (Pol.), ed. W. Poźniak (Kraków, 1962)

WRITINGS

Mémoires de Michel Ogiński sur la Pologne et les Polonais, depuis 1788 jusqu'à la fin de 1815, ed. L.J.B. Chodźko (Paris and Geneva, 1826–7; Pol. trans., 1870–77)

Lettres sur la musique adressées à un de ses amis de Florence en 1825 (MS, *PL-Kj*; Pol. trans., 1956)

Others (MSS, *USSR-Mcl*)

(3) **Franciszek Ksawery Ogiński** (*b* 1801; *d* 1837). Composer, eldest son of (2) Michał Kleofas Ogiński. He wrote polonaises for the piano, including two sets of three each published in Warsaw (after 1822, 1827–8) as well as romances for voice and piano including *Le page blessé à Pavie* (St Petersburg, n.d.) and three to texts by Scott and Zan (Warsaw, 1829).

Another son of (2) M.K. Ogiński, Tadeusz Ogiński, wrote a *Marche à quatre mains* (22 October 1822, *PL-Kj*), and a daughter Amelia Ogińska wrote several works at Zalesie (now in *Kj*): *Polonaise à 4 mains* (10 November 1822), and two *romances* ('Mon âme aujourd'hui', 1825, and 'J'aime la nuit').

The Polish composer Karol Ogiński (*fl* mid-18th century) did not belong to the princely family. He was probably a member of the orchestra of the Duke of Mecklenburg; his Sonata for violin and piano survives (*D-SWl*, ed. K. Sikorski, Kraków, 1955).

Oglivie, John. *See* OGILBY, JOHN.

Ognivtsev, Aleksandr Pavlovich (*b* Petrovskoye, Lugansk region, 27 Aug 1920). Russian bass. In 1949 he graduated from the Kishinyov conservatory and was engaged as a soloist by the Bol'shoy. His début as Dosifey (*Khovanshchina*) and his performances as Boris soon afterwards brought him immediate recognition as a singer of unusual dramatic accomplishment and authority, with a strong, beautiful voice of velvety timbre, and an imposing stage presence. A versatile actor, he took with equal success roles in high tragedy, complex psychological drama and comedy: his repertory included Ivan the Terrible (*The Maid of Pskov*), Prince Gremin (*Yevgeny Onegin*) and René (*Iolanta*), Gounod's Méphistophélès, Rossini's Don Basilio, Philip II, and the General (Prokofiev's *Gambler*), which he sang on the Bol'shoy visit to the Metropolitan in 1975. He created Nicholas I in Shaporin's *The Decembrists* (1953) and the Leader in Kholminov's *Optimisticheskaya tragediya* ('An Optimistic Tragedy', 1964), and sang Theseus in the first performances in the USSR of Britten's *A Midsummer Night's Dream* (1965). His film appearances included Aleko (in Rachmaninoff's opera, 1954). In 1965 he was made People's Artist of the USSR.

I.M. YAMPOL'SKY

Ogolevets, Aleksey Stepanovich (*b* Poltava, 17/29 May 1894; *d* Moscow, 15 Aug 1967). Soviet music historian, theorist, pianist and instrument maker. In 1912 he went to Moscow University to read physics and mathematics, but he changed to law and graduated in 1917. At the same time he studied at the Moscow People's Conservatory under Boleslav Yavorsky (composition) and Yevgeny Bogoslovsky and Aleksandr Goedicke (piano). Between 1912 and 1916 he appeared as a concert pianist and performed his own sonatas (all five of which have remained in manuscript) and other works, stylistically influenced by the Taneyev school. In 1915 he started teaching at the conservatory. He edited the literary journal *Gyulistan*, and from 1923 to 1933 held a number of posts in different publishing houses; from 1937 to 1941 he was

editor of the publishing house of the USSR Academy of Architecture. For several years he played an active part in the Union of Soviet Composers; he was chairman of the Moscow branch (1933–8), a member of the standing committee (1934–7) and vice-chairman of the Kuybïshev branch (1941–3). From 1953 until his death he was on the executive committee of the Society for Indo-Soviet Cultural Relations, and from 1952 until 1962 he was general editor of the research publication *Voprosï muzïkoznaniya* ('Questions of musicology').

In 1923 Ogolevets began his research into the harmonic possibilities of the untempered scale, and an important stage in this work was the construction in 1935 of a harmonium which was the first instrument to use a 17-note system. He discussed the general application of the results he had obtained in his monumental work *Osnovï garmonicheskogo yazïka* (1941). He continued his studies with an examination of the 17-note system of the Arabs and the 22-note system, or *shruti*, of the Indian peoples. After World War II he devoted most of his time to research, studying problems of the laws of harmony in European and Asian music, and problems of the pitch and intonation of language and music.

IGOR' BĖLZA

O'Hagan, Betsy. *See* WRIGHT, LAWRENCE.

O'Hampsey, Denis. *See* HEMPSON, DENIS.

Ohana, Maurice (*b* Casablanca, 12 June 1913; *d* Paris, 13 Nov 1992). French composer of Spanish descent. One of the leading independent figures in French music during the second half of the 20th century.

1. Background. 2. Achievement.

1. BACKGROUND. Throughout his life Ohana claimed to have been born in 1914. By his own declaration he was plagued by superstitions, particularly concerning the number 13: there is a certain irony, therefore, in the date of his death.

Ohana was described by Gide as a French Joseph Conrad. The intriguing parallel highlights the unusual complexity of Ohana's cultural origins which, like those of the Ukrainian-born Pole, were different from his bureaucratic national identity. Both Ohana and Conrad were British citizens. (Ohana took French nationality in 1976.) Born in French, colonial Morocco into a family of Spanish origins (Gibraltarian-Andalusian on his father's side and Andalusian-Castilian on his mother's), Ohana inherited his British citizenship from his father. The southern culture from which he stemmed reaches beyond the political boundaries of any one country; hence in later life he spoke more of cultural roots and geographical influence than of nationality. As in many Gibraltarian families, English was spoken in the Ohana household, as well as Spanish, while French was, by necessity, Ohana's language of education and training. He remained trilingual, publishing writings and conducting interviews in all three languages. Describing himself as Spanish by birth and upbringing but French by training and adoption, he had much in common with the stream of Spanish musicians, artists and writers who migrated north to Paris to exploit their cultural heritage. His cultural complexity contributed to the relative neglect of his music in the Anglo-Saxon world. In France, where fascination with the exotic and acceptance of the eclectic are long established, his music has enjoyed a position of eminence since his emergence as a composer in the 1950s. He received numerous prizes and distinctions throughout his lifetime.

Cosmopolitan in upbringing, he spent his youth in Morocco, Spain and the Basque region, and became familiar with Spanish folk music from an early age. He learnt many legends and dances of Spain, as well as repertory from the *chanson de geste* to the zarzuela from his mother, while his Andalusian-gypsy nurse nurtured him into the tradition of the *cante jondo*. His musical gifts were recognized early, and he gave his first public piano recital at the age of 11, the programme including Chopin's Study op.10 no.5 and Beethoven's op.13 Sonata. Soon after, he enrolled at the Bayonne Conservatoire, where he studied until 1931 as a pupil of Ermend Bonnal. Before the age of 18 he had publicly performed all 32 Beethoven piano sonatas, though as a mature composer he did not remember the experience fondly, feeling ill at ease with music belonging to the Austro-German tradition. Another teacher, Jéhanne Pâris, organist at Ste Eugénie in Biarritz, led him to discover many works, including the quartets of Debussy and Ravel, which remained important to him. He took the baccalauréat in 1932 and went to Paris the same year, originally to study architecture.

Following two years at the Ecole des Beaux-Arts, he entered the Ecole Nationale Supérieure des Arts Decoratifs in 1934. He met Mallet Stephens and visited the workshop of Le Corbusier. Against his father's wishes he continued his musical training, studying piano with Lazare-Lévy and later with Frank Marshall. In 1936 he abandoned his architectural studies and devoted himself solely to the career of a pianist, giving his Paris début recital in February 1936 at the Salle Pleyel. Of mammoth proportions, the programme clearly revealed his instinctive cultural alignment and included works by Scarlatti, Chopin, Debussy, Granados, Ravel and Albéniz. Before the war he played in many European cities (including London), and he performed Falla's *Noches en los jardines de España* at the Salle Gaveau with the Lamoureux Orchestra and Eugène Bigot in both 1937 and 1938. Despite his success as a pianist, he was increasingly drawn to composition and made his first sketches at this time. Feeling the need to extend the scope of his musical training he enrolled at the Schola Cantorum in 1937 and studied for three years with Daniel-Lesur. His studies in counterpoint, plainsong and the medieval and Renaissance repertory, characteristic of the Schola, proved a lasting influence on his musical language and vocal style.

An earlier chance meeting with the flamenco dancer and singer La Argentinita (Encarnación Júlvez López) in October 1936 had encouraged him to look to his Spanish origins as the catalyst in developing a compositional style. Already an established artist closely associated with Lorca and his circle, La Argentinita was famed not only for her Ballet Espagnol and revival of traditional Spanish folk music but also her collaborations with Falla. Together with the guitarist Ramón Montoya, Ohana and La Argentinita formed a trio and made a tour of Spain and northern Europe that included appearances at the Salle Pleyel and the Arts Theatre Club in London. Some of Ohana's first works were composed for La Argentinita, although most he subsequently destroyed or withheld from publication. Through her he became acquainted with many of the leading figures in ballet at the time, these contacts resulting in several commissions for ballet scores during the 1950s. As a further encouragement to draw on Spanish subjects, La Argentinita gave Ohana the manuscript of Lorca's poem *Llanto por Ignacio Sánchez Mejías* which he set for baritone, narrator, chorus and orchestra in 1950.

Throughout this early period, Ohana became increasingly fascinated with improvised folk music traditions, including not only Spanish folk music and the jazz he heard in Paris, but African tribal music. When visiting his home in Casablanca, he travelled into the Atlas mountains to seek out the indigenous berbers, sometimes participating in their tribal ceremonies. He absorbed much about their means of improvisation and learned many of their choral songs and microtonal melodies. He also discovered sub-Saharan African music, the rhythmic processes of which proved a decisive influence on his compositional development. He continued to make journeys to Africa, north and south of the Sahara, until 1965. Although he published some studies of Spanish folk-music, most of his research was intended more for compositional than musicological purposes. The cross-fertilizations between Spanish and African musics and culture became an enduring fascination, African and Afro-Cuban rhythmic patterns and drumming techniques providing a stimulus to which his fullest response came in the works of his last decade, most notably his final work, *Avoaha* (1991).

2. ACHIEVEMENT. Ohana's real beginnings as a composer were interrupted by the outbreak of World War II. Fleeing France in 1940 via Portugal, he joined the British Army and saw active service in Africa, Madagascar, Greece and Italy. During periods of military inactivity he absorbed himself in the five scores he carried in his pack throughout his army life: Falla's *El retablo de maese Pedro* and Harpsichord Concerto, Debussy's *Prélude à l'après-midi d'un faune* and *Nocturnes*, and Ravel's Concerto for the Left Hand. Holding a commission in the Intelligence Corps, he found himself in 1944 in Rome, where he joined Casella's piano class at the Accademia di Santa Cecilia. His first published works, 'Enterrar y Callar' (*Trois caprices*) and the *Sonatine monodique*, both for piano, date from this period. Shortly after the cessation of hostilities he gave a recital at the Institut Français in Naples and there met Gide, who was impressed by his interpretations of Chopin. They remained in contact until Gide's death, and Ohana assisted on Gide's *Notes sur Chopin*. Following demobilization in 1946 Ohana settled permanently in Paris and devoted himself increasingly to composition, gradually winding down his performing activities.

Developing a musical language based on plainsong, techniques of early counterpoint, rhythmic processes derived from African tribal music, and melodic features from Spanish folk music, Ohana was not attracted to the new serialism of his contemporaries. He declared his fierce independence from Austro-German traditions by founding the Groupe Zodiaque in 1947 along with two other students of Daniel-Lesur, Alain Bermat and Pierre de la Forest-Divonne. They were joined in 1948 by Sergio de Castro, a former pupil of Falla, and Stanislaw Skrowaczewski, then studying with Nadia Boulanger. The group, which mounted concerts on French Radio and at the Salle Gaveau from 1947 to 1950, rejected not only the tyranny of serialism and the neo-Romanticism of La Jeune France but all aesthetic dogma, advocating instead a reassessment of their respective folk music traditions and plainsong as the basis for an organic musical language that should avoid any elaborate precompositional system. Ohana's conscious distancing of himself from Darmstadt resulted in exclusion from the concerts of the Domaine Musical, which in turn contributed to his neglect in the United Kingdom. Sympathetic to the independent standpoint of the Zodiaque composers, the positions both Dutilleux and Daniel-Lesur held at French radio were crucial in providing a platform for the group's music. Although Zodiaque had disintegrated by 1950, Ohana kept his association with French radio and worked for a short time with Pierre Schaeffer; he incorporated electronic tape in several works, most notably in *Sibylle* (1968) where it is combined with soprano and percussion.

Many of Ohana's works of the 1950s draw on Spanish subjects and texts, or allude to forms borrowed from Spanish folk music. His setting of Lorca's *Llanto por Ignacio Sánchez Mejías* owes much to the timbral acidity of Falla and includes an orchestral harpsichord. Together with *Cantigas*, based on the monodies of Alfonso el Sabio, these were his first important large-scale works, and show his growing predilection for the voice. *Tiento* alludes to the traditional Spanish form associated with the guitar, while the guitar concerto *Trois graphiques*, *Si le jour paraît. . .* and the *Trois caprices* are based on engravings by Goya. While Spanish influences continued to emerge in certain mature works, notably the first cello concerto, *Anneau du Tamarit*, and the opera *La Célestine*, they were absorbed into a more homogeneous, if widely eclectic musical language that includes elements of jazz, Afro-Cuban music, and Chinese and Japanese theatre music. His melodic parallelism and colouristic view of harmony as timbre, or sound mass, owes much to Debussy and has parallels in Varèse, just as his superimposed layers of ostinatos in aleatory counterpoint owe much to Stravinsky and have parallels in Lutosławski. His first incorporations of African and Afro-Cuban rhythmic patterns appear in the percussion ballet *Etudes chorégraphiques*, but were more fully developed in the layering techniques of the percussion concertos *Synaxis* and *Silenciaire*, and more freely adapted in certain vocal works, particularly *Cris*, *Lys de madrigaux* and the Mass.

As a result of the stylistic and technical experimentation prompted by Ohana's many commissions for incidental music in the 1950s and early 1960s, the middle 1960s marked a stylistic watershed and witnessed the emergence of his mature style. The *Quatre improvisations* for flute

Ex.1 Ohana's micro-interval scales of third-tones illustrating their construction from both whole-tone scales

seek to recreate the spontaneity of improvisation, while *Tombeau de Claude Debussy* for soprano, piano, zither and orchestra, takes as its point of departure several piano works of Debussy and makes use of a coordinated system of third-tones, created by subdividing each interval of either whole-tone scale into three (ex.1); the third-tone-tuned zither was thenceforth a recurrent feature of his music. The first string quartet, *Cinq séquences*, includes sections of aleatory counterpoint, and *Si le jour paraît. . .* for the newly invented ten-string guitar, further explores an Impressionism stemming from Debussy. Incorporating all these new textures and techniques, *Signes* for instrumental ensemble (1965) represents the complete emergence of his mature style. It is the first of a series of eleven works composed during the 1960s and 1970s bearing esoteric titles beginning with the same letter, the 'Sigma Series', which according to the composer symbolized evolution and the proliferation of his mature style into his second 50 years. With its title partly borne out by hand-drawn ciphers at the head of each movement, *Signes* is also one of many works to incorporate allusions to extra-musical symbolism, in this case the image of the tree. Other works notable for their allusive symbolism include the chamber opera *Auto-da-fé*, the orchestral works *T'Harân-Ngô* and *Livre des prodiges*, and *Trois contes de l'honorable fleur*, music theatre for soprano and ensemble.

Ohana contributed to almost every vocal and instrumental genre and was conspicuous in the harpsichord revival: the concerto *Chiffres de clavecin* and the opera *La Célestine* are representative. In *Sacral d'Ilx* for harpsichord, oboe and horn he used the instrumental combination envisaged by Debussy for the fourth of his uncompleted series of late sonatas. Other instruments he favoured include the guitar, the piano and the two he invented: the third-tone zither and the ten-string guitar. Prolific as a composer for the voice, writing opera, chamber opera and music theatre, as well as non-dramatic works, he concentrated on vocal music in his last years and produced some of his most personal statements. In *Swan Song* (1987–8) he composed his epitaph.

WORKS

STAGE

Les répresentations de Tanit (ballet, M. Béjart), orch, 1951, Enghien, Casino, 1956; suite, pf, withdrawn

La soirée des proverbes (incid music, G. Schéhadé) (fl, 2 ob, bn, hn, perc)/(fl, perc), 1953–4, unpubd, Paris, Marigny, 30 Jan 1954

Paso, solea (ballet, F. Dominique), orch, 1954, Lyons, Opéra, 1955, unpubd

Etudes chorégraphiques (ballet, M. Parrès), 4–6 perc, 1955–61, Strasbourg, 8 June 1963

Le guignol au gourdin (incid music, F. García Lorca: *Tragicomedia de Don Cristobal y la seña Rosita*), 1956, unpubd; arr. as music theatre, 1958, Carcassonne, July 1958

Prométhée (ballet, Béjart), chbr orch, 1955–6, Lyons, July 1956, withdrawn; suite, orch, 1958

Récit de l'an zéro (dramatic orat, G. Schéhadé), 1958–9, Paris, Grand Auditorium de l'ORTF, 11 April 1959

Histoire véridique de Jacotin (incid music, C.J. Cela, adapted A. Trutat), 1961, Paris, ORTF, 1961; rev. as Le mariage sous la mer (children's chbr op), 1990, Boulogne-Billancourt, Conservatoire National, 18 April 1991

Syllabaire pour Phèdre (chbr op, 6 episodes, R. Cluzel and M. Ohana, after Euripides), 1966–7, Paris, Musique, 5 Feb 1968

Auto-da-fé (dramatic cant., Ohana) spkr, 3 SATB, ens, puppets, 1971, Vaison-la-Romaine, 9 Aug 1971; rev. 1972 as chbr op (10 scenes, Ohana), Lyons, Opéra, 23 May 1972

Office des oracles (music theatre, Ohana), 1974, La Sainte-Baume, 9 Aug 1974

Trois contes de l'honorable fleur (music theatre, O. Marcel, after Ohana), 1978, Avignon, 15 July 1978

La Célestine (op, 2, Ohana and O. Marcel, after F. de Rojas), 1982–8, Paris, Opéra, 13 June 1988; see also VOCAL [Suite de concert de la Célestine 1989–90; 3 prophéties de la Sibylle, 1989–90]; CHAMBER AND SOLO INSTRUMENTAL [Miroir de Célestine, 1989–90]

Sundown Dances (ballet, E. Hawkins), fl, cl, tpt, trbn, perc, vn. db, 1990, Washington, DC, Kennedy Center, May 1991

OTHER INCIDENTAL MUSIC
(selective list)

Les hommes et les autres (A. Trutat, after E. Vittorini), ens, 1956, unpubd; Médée (J. Bergamin, after Seneca), ens, 1956; Images de Don Quichotte, ens, 1956; Fuenteovejuna (Lope de Vega), SATB, wind, perc, 1957, unpubd; Homère et l'orchidée (B. Horowiscz), ⅓-tone zither, 1959, withdrawn; Hélène (Euripides), female chorus, ens, 1963, unpubd; Les héraclides (Euripides), SATB, wind, pf, ⅓-tone zither, perc, 1964, unpubd; Iphigénie en Tauride (Euripides), solo vv, pf, ⅓-tone zither, 4 perc, 1965, unpubd; Hippolyte (Euripides), S, Mez, SATB, ens, 1966, unpubd

ORCHESTRAL

Sarabande, hpd, orch, 1950, unpubd; 3 graphiques, gui, orch, 4 perc, 1950–57; Synaxis, 2 pf, 4 perc, orch, 1966; Chiffres de clavecin, hpd, orch, 1968; Silenciaire, 6 perc, str, 1969; T'Harân-Ngô, orch, 1974; Anneau du Tamarit, vc, orch, 1976; Livre des prodiges, orch, 1978–9; Crypt, str, 1980; Pf Conc. 1981; In Dark and Blue, vc, orch, 1989–90

VOCAL

Choral: Llanto por Ignacio Sánchez Mejías (García Lorca), orat, Bar, spkr, female vv, orch, 1950; Cantigas (J. de Valdivielso, F.A. Mortesino, G. de Berceo, Alfonso X, J. Alvarez), child's voice, S, Mez, SATB, pf, orch, 1953–4; Cris, SATB, 1968–9; Lys de madrigaux, female vv, ens, 1975–6; Mass, S, Mez, SATB, ens, 1977; 4 choeurs, children's vv, 1987; Lux Noctis – Dies solis (Catullus, Lat. anon.), 4 choral groups, children's vv, 2 org, perc, 1983–8; Swan Song (Ohana, after P. Ronsard), SATB, 1987–8; Suite de concert de la Célestine, solo vv, SATB, orch, 1989–90; Tombeau de Louize Labé 'O beaux yeus bruns', SATB, 1990; Nuit de Pouchkine, Ct, SATB, va da gamba/vc, 1990; Avoaha, SATB, 2 pf, perc, 1990–91

Solo: 2 mélodies (García Lorca), S, pf, 1947, arr. S, gui/hpd, unpubd; 3 poèmes de Saadi (trans. F. Toussaint), Bar, orch, 1947, unpubd; Tombeau de Claude Debussy, S, ⅓-tone zither, pf, orch, 1962; Sibylle, S, perc, tape, 1968; Stream, B, str trio, 1970; 2 incantations, S, fl, pf, 1972–4 [no.1 from op Auto-da-fé; no.2 from music theatre Office des oracles]; 3 prophéties de la Sibylle, 2 S, pf, perc, 1989–90 [from op La Célestine]

Orchestration: Satie: La messe des pauvres, 1990

CHAMBER AND SOLO INSTRUMENTAL

3 or more insts: 5 séquences, str qt, 1963; Signes, fl + pic, chromatic zither, ⅓-tone zither, pf, 4 perc, 1965; Sacral d'Ilx, ob, hn, hpd, 1975; Str Qt no.2, 1978–80; Kypris, ob/ob d'amore, va, db, pf, 1985; Str Qt no.3 'Sorgin-Ngo', 1989

2 insts: 2 danses, 2 perc, 1954, unpubd; Neumes, ob, pf, 1965; Sorôn-Ngô, 2 pf, 1969–70; Syrtes, vc, pf, 1970; Noctuaire, vc, pf, 1976; Satyres, 2 fl, 1976; Anonyme XXème siècle, 2 gui, 1988; Miroir de Célestine, hpd, perc, 1989–90
Solo ww: 4 improvisations, fl, 1960; Sarc, ob, 1972
Pf: Sonatine monodique, 1945; 3 caprices, 1944–54; 24 préludes, 1972–3; 12 études d'interprétation: bk i, 1982, bk ii, 1983–5 [nos.11 and 12 with perc]
Hpd: Tiento, 1957 [arr. of gui piece]; Carillons 'Pour les heures du jour et de la nuit', 1960; 2 pièces, 1983 [no.1 arr. of Wamba]; So Tango, 1991
Gui: Tiento, 1957; Si le jour paraît. . . 10-str gui, 1963–4, arr. 6-str gui; Cadran lunaire, 10-str gui, 1981–2, arr. 6-str gui
Carillon: Wamba, 1980

CAROLINE RAE

O'Hara, Kane [Kean, Kene] (*b* ?Dublin or Co. Sligo, 1711/12; *d* Dublin, 17 June 1782). Irish librettist and musician. He was the younger son of Kean O'Hara, High Sheriff of County Sligo in 1703, and married the widow of Theobald Mathew the younger of Thomastown, County Tipperary. He was admitted to Trinity College, Dublin, on 3 March 1728 at the age of 16 and graduated in 1732. He is known chiefly as the librettist and arranger of the music for *Midas* (repr. of lib and facs. of 4 airs from score (*Us-Ws*) in Dircks; lib ed. Dircks, New York, 1987), the first 'English burletta', presented at the Crow Street Theatre, Dublin, on 22 January 1762 as a rival attraction to the season of Italian burlettas at the Smock Alley Theatre. Flood (*History of Irish Music*) stated that it had previously been performed at the private theatre of

the Rt Hon. William Brownlow MP in Lurgan in April 1760; and O'Keeffe (*Recollections*) described a meeting at O'Hara's house in King Street, Dublin, at which O'Hara, Lord Mornington and Brownlow were 'settling the music for Midas'. The music contains popular songs of the time, such as arias from Italian operas and folksongs from Ireland and other countries, linked by dialogue set to recitative. There is frequent resort to concerted numbers. With characters consisting of mythological gods and mortals, *Midas* is in reality a burlesque of *opera seria*. It attained considerable popularity and was frequently performed in London after the first production at Covent Garden on 22 February 1764.

O'Hara was also author of the libretto for Thomas Arne's pasticcio of 1773, *The Golden Pippin* (lib ed. Dircks, New York, 1987), and was responsible for the musical farce *Two Misers* (Covent Garden, 21 January 1775), which was covenanted to Thomas Ryder in 1780 for production at Crow Street in Dublin, the burlesque *A Fine Day* (Haymarket, 22 August 1777), and a version of Fielding's *Tom Thumb* (Covent Garden, 3 October 1780), which had been set by both Arne and J.F. Lampe in 1733. He was vice-president of Lord Mornington's Musical Academy, which was founded in 1757 mainly through his exertions. For the last four years of his life he was blind.

Ohio Chamber Orchestra. Orchestra established in 1972, based in CLEVELAND.

Ohio State University School of Music. A school of music in the college of the arts of the state university at Columbus, Ohio, USA. The university opened in 1873 and soon began to offer music instruction; the school of music was established in 1945. Its first director was Eugene J. Weigel (1894–1973), also director of the university's renowned marching band. Students numbered about 550 and faculty about 65 in the 1990s; BA, BM, BME, AB, MM, MA, DMA and PhD degrees are awarded in performance, conducting, jazz studies, music education, theory, composition and music history. The library holds over 130,000 volumes and 38,000 recordings. The Weigel Hall (1980) at the school has a recital hall with a movable ceiling and other acoustical refinements.

BRUCE CARR

Öhlberger, Karl (*b* St Pölten, 30 March 1912). Austrian bassoonist and teacher. On completing his studies under Karl Strobl in Vienna in 1936, he had the rare distinction of being appointed to the principal position in the Vienna PO. Two years later he succeeded his teacher as professor at the Vienna Music Academy. In these positions he upheld the highest traditions of the Viennese school of wind playing, exerting considerable influence by attracting students from many foreign countries. He retired from the Vienna PO in 1974. His 80th birthday was commemorated by a Festschrift, *Fagott Forever*, edited by W.H. Sallagar and Michael Nagy (Wilhering, 1992).

WILLIAM WATERHOUSE

Ohlsson, Garrick (Olof) (*b* Bronxville, NY, 3 April 1948). American pianist. His first teacher was Thomas Lishman at the Westchester Conservatory, and at 13 he went to Sascha Gorodnitzki at the Juilliard School, where he also studied with Rosina Lhévinne. The most crucial influence, however, was Olga Barabini, a pupil of both Arrau and Hofmann. Ohlsson's career was established when he became the first American to win the Warsaw International Chopin Competition (1970); he had already attracted attention as the winner of competitions in Bolzano (1966) and Montreal (1968). Because of his Warsaw success he became known as a Chopin player and has made many tours of Poland. His repertory is nevertheless broad and includes even such early composers as Thomas Tomkins, while Skryabin is a special interest. He has appeared with major symphony orchestras across Europe, the USA, Japan and New Zealand and at numerous festivals including the Proms and the City of London Festival.

Ohlsson is a large man with large hands who plays easily such works as Skryabin's Etude in 9ths. His technique is complete, his tone large and unpercussive, though hard-edged. He is a musician with a modest manner and exceptional intelligence, adept at projecting, for example, the subtle forms of late Chopin, if tending towards heaviness in late Romantic works. He has made many recordings, including works by Chopin, the complete piano music of Brahms and an unusual recording of Wagner performed on the composer's own piano. In 1984 Ohlsson was the soloist for the world première of Wuorinen's Third Piano Concerto.

MICHAEL STEINBERG/R

Ohm, Georg Simon (*b* Erlangen, 16 March 1789; *d* Munich, 6 July 1854). German scientist. He studied mathematics at the University of Erlangen, taking a degree in 1811. He spent the rest of his life in a series of undistinguished posts, teaching mathematics and later physics at a relatively elementary level, apart from a period (1833–49) as professor of physics and rector of the Polytechnic Institute at Nuremberg. Among his writings is the paper of 1827 which contained the famous Ohm's Law of Electricity, which however was little recognized at the time. His contribution to music is contained in two papers (published in *Annalen der Physik uns Chemie*, 1843 and 1844) in which he presented what became known as Ohm's Law of Acoustics: he suggested that musical sounds depended not on phase but on the distribution of energies among the harmonics. His research stimulated Helmholtz's important experiments in the 1850s and 1860s, and dominated the conception of the subject for a century. Ohm's place in musical acoustics, although less publicized, is as secure as his place in electromagnetic theory.

JAMES F. BELL/MURRAY CAMPBELL

Ohms, Elisabeth (*b* Arnhem, 17 May 1888; *d* Marquartstein, 16 Oct 1974). Dutch soprano. After study in Amsterdam and Frankfurt, she made her début at Mainz

in 1921, and in 1923 joined the Staatsoper in Munich, where she spent the greater part of her career; she was appointed *Kammersängerin*, and married the Munich stage designer Leo Pasetti. Her many notable performances as Brünnhilde and Isolde during the Munich summer festivals made her name familiar to a wider public, and she began to make guest appearances elsewhere, notably at La Scala, in 1927 and 1928, under Toscanini in *Fidelio* and *Parsifal*, at Bayreuth in 1931 in *Parsifal* (again with Toscanini), and at Covent Garden during three seasons in Wagnerian roles and as Strauss's Marschallin. At the Metropolitan during three consecutive seasons (from January 1930) she appeared in all the heavier Wagner roles. In Munich her non-Wagnerian parts, besides those mentioned, included Turandot and Strauss's Helena of Troy. Her dark-coloured, heroic soprano is well represented, among her few recordings, by a majestic 'Ozean, du Ungeheuer' from Weber's *Oberon*.

DESMOND SHAWE-TAYLOR

Ohren, Jacob. *See* ØRN, JACOB.

Oiseau-Lyre, L'. French/British music publisher and record company. It was named after the rare Australian lyrebird (*menura superba* or *novaehollandiae*) and founded in 1932 as Les Editions de l'Oiseau-Lyre ('The Lyrebird Press') in Paris by Louise B.M. Dyer, née Smith (1884–1962), an Australian patron of the arts. Her aims were to make available early music that had never been printed in a good modern edition, and to support contemporary composers (Auric, Canteloube, Ibert, d'Indy, Milhaud, Roussel, Sauguet, Britten, Holst and the Australians Peggy Glanville-Hicks and Margaret Sutherland, among others) by commissioning and publishing their works. Her first project was the publication (1932–3) of the complete works of François Couperin to coincide with the 200th anniversary of the composer's death. The 12-volume limited edition that resulted epitomized the quality of subsequent publications in its rigorous scholarship, elegant engraving and modish book design.

After the death of her first husband, Louise Dyer married Joseph ('Jeff') B. Hanson (1910–71) in 1938. Over nearly 25 years they produced a remarkable catalogue of fine editions and scholarly books. The firm's headquarters moved to Monaco in 1947; after Dyer's death the firm was run by Hanson. From 1971 to 1996, the publishing venture of L'Oiseau-Lyre was run by Hanson's second wife, Margarita Hanson, née Menendez, who undertook a series of reprints and revisions of existing editions, notably the Couperin complete works. A series entitled Magnus Liber Organi was begun in 1993 with a plan to include seven volumes. In 1979 L'Oiseau-Lyre entered into an agreement with the University of Melbourne whereby regular income from funds bequeathed to the university by Dyer and J.B. Hanson would support publication costs until 2005.

With music ranging from the 13th century to the 20th, L'Oiseau-Lyre's catalogue has always placed special emphasis on French music, especially the 17th- and 18th-century repertory. Publications are divided between scholarly series and performing editions. The firm's most significant undertaking has been the numbered, limited edition Polyphonic Music of the Fourteenth Century (25 vols., 1956–92).

The first recordings produced by Editions de l'Oiseau-Lyre appeared in 1939. In 1953 distribution of L'Oiseau-Lyre recordings was undertaken by Decca. The company was the first to record several notable artists, among them Janet Baker, Alfred Deller and Colin Davis; Joan Sutherland also made her first recording (of 18th-century arias) with L'Oiseau-Lyre in Paris in 1959, released by Decca only in 1981. The recording business was continued by Hanson after Dyer's death, and sold to Decca in 1970.

Under the direction of Raymond Ware, the label issued recordings of music by contemporary composers, notably Maxwell Davies, Henze and Shostakovich, as well as major Purcell stage works and the first recordings by the Academy of Ancient Music directed by Christopher Hogwood. In 1974 L'Oiseau-Lyre embarked on the pioneering Florilegium series (conceived by Christopher Hogwood and the producer Peter Wadland) with music from the Middle Ages to the Romantic period played on period instruments. Recordings issued over the next 21 years included a large Baroque repertory (including Bach concertos and operas and oratorios by Handel), the complete symphonies of Mozart and Beethoven and many by Haydn played by the Academy of Ancient Music under Hogwood, the complete Beethoven piano sonatas played by Malcolm Binns, Mozart's Da Ponte operas from Drottningholm conducted by Arnold Östman, choral recordings by the Choir of Christ Church, Oxford, under Simon Preston, and much-admired discs of English and Italian Renaissance music by Anthony Rooley and the Consort of Musicke, featuring Emma Kirkby. Artists appearing on the label also included Philip Pickett and the New London Consort, Catherine Bott, the Amsterdam Loeki Stardust Quartet, Christophe Coin and Christophe Rousset (with solo harpsichord albums and his own orchestra, Les Talens Lyriques, in complete opera recordings of works by Mondonville, Handel, Traetta etc.). (J. Davidson: *Lyrebird Rising: Louise Hanson-Dyer of L'Oiseau-Lyre, 1884–1962*, Melbourne, 1994)

ORHAN MEMED, MAUREEN FORTEY

Oistrakh, David (Fyodorovich) (*b* Odessa, 17/30 Sept 1908; *d* Amsterdam, 24 Oct 1974). Ukrainian violinist. He studied with Pyotr Stolyarsky from the age of five until his graduation (playing both violin and viola) from the Odessa State Conservatory in 1926. (In 1914 he and Nathan Milstein appeared on the same student programme.) While still a student, Oistrakh played with the Odessa SO, as both soloist and leader. In 1927 Glazunov invited him to play his concerto under him in Kiev.

Oistrakh made his début in Leningrad in 1928, and in Moscow the following year. In 1928 he moved to Moscow, and there began a period of intense artistic growth. During the 1930s he won first prizes in the Ukrainian Contest (1930) and the All-Soviet Contest (1935); second prize in the Wieniawski Contest (1935; the first prize was won by Ginette Neveu); and first prize in the Concours Eugène Ysaÿe in Brussels in 1937. This was the beginning of his international career; but during the war he played at the front, in besieged Leningrad, in hospitals and factories. The performance of Bach's Double Concerto in 1945 in Moscow with Menuhin (the first foreign artist to visit the Soviet Union after the war) was memorable. In 1946–7 Oistrakh gave a cycle of five programmes, 'The Development of the Violin Concerto', which included the concertos of Sibelius, Elgar and Walton, as well as Khachaturian's, dedicated to him. At

David Oistrakh

his New York début in 1955 he introduced Shostakovich's First Concerto, written for him.

Oistrakh was counted among the greatest violinists of his day, and the most characteristic representative of the Russian school. This is remarkable since his training took place in Odessa, without contact with the Auer school. However, while his early style stressed elegance, he developed his monumental style during his Moscow years. His technical mastery was complete, his tone warm and powerful, and his approach a perfect fusion of virtuosity and musicianship. His willingness to perform new music was notable and many Soviet composers dedicated works to him (Prokofiev, Shostakovich, Myaskovsky, Khachaturian, Rakov, Weinberg). Oistrakh also played sonatas with Lev Oborin and trios with Oborin and Knushevitsky, and was known as a gifted conductor.

In 1934 he was appointed to the Moscow Conservatory; among his students were his son Igor′ and Valery Klimov. He was named People's Artist of the USSR in 1954 and received the Lenin Prize in 1960; he was also honoured by the Royal Academy of Music, London, and the Conservatorio di S Cecilia, Rome. He edited standard violin works and arranged Prokofiev's Flute Sonata with the composer's approval. His hobby was chess, and in 1937 he played a match against Prokofiev.

BORIS SCHWARZ/R

Oistrakh, Igor′ (Davidovich) (*b* Odessa, 27 April 1931). Ukrainian violinist, son of DAVID OISTRAKH. His principal teacher was his father. After attending the Central Music School in Moscow, Igor′ studied at the Moscow Conservatory and graduated in 1955. While still a student, he won first prize at the International Festival of Democratic Youth in Budapest in 1949 and at the Wieniawski Competition in Poznań in 1952. He was appointed to the staff of the Moscow Conservatory in 1958 (at first as assistant to his father) and became a lecturer in 1965.

His achievements have sometimes been overshadowed by comparison to his father. However, Igor′ has a musical profile of his own: his approach to music is leaner and more modern, his tone cooler and less emotional, and his interpretations more detached and objective. His style lends itself particularly well to such works as Bartók's Violin Concerto no.2. The performances by father and son in violin duets by Leclair and Spohr, as well as in double concertos, were of special interest. They also performed with Igor′ as soloist and David as conductor. Igor′'s partner at the piano is his wife, Natal′ya Sertsalova. (D. Blum: 'The Oistrakh Tradition', *The Strad*, c (1989), 210–15)

BORIS SCHWARZ

Oja, Carol J(ean) (*b* Hibbing, MN, 18 March 1953). American musicologist. She took the BA at St Olaf College, Minnesota in 1974 and the MA at the University of Iowa in 1976. She studied with H. Wiley Hitchcock, Barry Brook and Sherman Van Solkema at CUNY, taking the doctorate there in 1985 with a dissertation on Colin McPhee. In 1985 she became professor of music at Brooklyn College and the Graduate School, CUNY. From 1980 to 1984 she was a research assistant at the Institute for Studies in American Music at Brooklyn College; in 1993 she became director of the Institute. Her main area of study is American music, with emphasis on the 20th century. She has focussed on the period between the wars, discussing musical publications and publishers of the time. She has written on a wide range of American composers, among them McPhee, Gershwin, Copland, Sessions, Blitzstein, William Grant Still, Virgil Thomson and Elie Siegmeister; she has also edited a volume of Stravinsky's writings in *Modern Music* (1982).

PAULA MORGAN

Ojinaga, Joaquin de. *See* OXINAGA, JOAQUÍN DE.

O'Keeffe [O'Keefe], **John** (*b* Dublin, 24 June 1747; *d* Southampton, 4 Feb 1833). Irish librettist. He wrote his first play at the age of 15 and acted on the Irish stage before settling in London in 1781. He was a prolific comic dramatist for the Haymarket and Covent Garden theatres, although an accident when he was 27 led to deteriorating sight and he had to dictate all his works from 1781. His most successful pieces were librettos for pasticcio operas with music composed, selected and arranged by Samuel Arnold or William Shield. *The Thespian Dictionary* described O'Keeffe as having 'an excellent taste for music, though no theoretic knowledge', and said that the tunes for his pastoral ballad opera *Collin's Welcome* (written while he was still in Ireland) were 'of his own adapting'. He carefully designed parts for his singers, such as the 'broken English' role for Giovanna Sestini in *The Castle of Andalusia* and Patrick in *The Poor Soldier* for the Irish contralto Margaret Kennedy. He provided Shield with tunes for this opera by singing to him 'the fine Irish airs' of the harper Carolan. 'The Ploughboy', Shield's most famous song, is from his short opera *The Farmer*. Kelly remembered O'Keeffe in 1793 as 'broken down, and almost blind; but still full of pleasantry and anecdote'.

OLIVE BALDWIN, THELMA WILSON

O'Keeffe [Ó Caoimh], **Pádraig** (*b* Castleisland, Co. Kerry, 8 Oct 1887; *d* Tralee, Co. Kerry, 22 Feb 1963). Irish traditional fiddle player and music teacher. Born in Sliabh Luachra, an area comprising parts of Kerry and Cork noted for its traditional culture, he showed early musical promise and learnt from his mother and his uncles. He trained as a primary teacher in Dublin before briefly assuming his father's former position as the local school teacher. From 1920 he was a highly influential travelling music teacher in Sliabh Luachra, walking long distances daily from his home base. He taught mainly the fiddle and the accordion and frequently played for both listeners and dancers. After teaching tunes orally, he usually gave his pupils notations in tablature for both instruments as aides-mémoires, and changes in the music repertory of his district can be traced in surviving notations. He introduced tunes from a variety of printed sources and commercial sound recordings and developed his own versions of traditional melodies. He preferred to play slow airs rather than the characteristic polkas and slides of Sliabh Luachra. O'Keeffe's vivid personality and wit, his position as an entertainer in the local community and his rakish way of life made him a figure of folklore, and his musical influence continues through the playing of his pupils and his recordings. Some of his large repertory was recorded for the archives of the Irish Folklore Commission and by Radio Éireann and the BBC.

NICHOLAS CAROLAN

Okeghem, Johannes. *See* OCKEGHEM, JEAN DE.

OKeh. American record company. It was established in 1918 by General Phonograph, an enterprise set up in New York in 1916 by Otto Heinemann to manage the American operations of Carl Lindström's German company. Jazz recordings began with items by the New Orleans Jazz Band. Recordings by Mamie Smith established OKeh's primacy in the field, which was reinforced in 1921 by the setting up of a race series (until 1923 called the Colored Catalog). It became an important jazz, blues and gospel catalogue and included material by Clarence Williams (from 1921), King Oliver (1923), Louis Armstrong's Hot Five and Hot Seven (1925–9), Lonnie Johnson, Mississippi John Hurt, J.M. Gates and Bennie Moten's band (1923–5). Discs by Frankie Trumbauer, Bix Beiderbecke and Eddie Lang were issued in a general popular series, and there were also separate series for country music, calypso, Jewish music, European popular music (for post-war immigrants) and Mexican music. The company's activities were little affected when it was taken over by Columbia in 1926; Heinemann ran OKeh as a new subsidiary specializing in jazz, blues, gospel and popular music but also including violin solos by Eugene Ormandy and a huge novelty hit, the *Original Lauf-Aufnahme*. Control passed to ARC–BRC in August 1934; later that year the race series was discontinued after almost 1000 issues. ARC–BRC dropped the name OKeh but CBS, which acquired the company in 1938, revived it and continued the numerical series of the Vocalion label, pressing early issues anew with OKeh labels. In the early 1950s the label became CBS's main outlet for rhythm and blues.

HOWARD RYE

Okeland [Hockland, Oclande], **Robert** (*fl* 1532–50). English church musician and composer. From August 1532 to January 1534 he was a lay clerk at Eton College, whence he moved immediately to the parish-church of St Mary-at-Hill, London, remaining there until August 1535 as Master of the Choristers and organist. By June 1545 he was a Gentleman of the Chapel Royal; he last appears there in April 1547, but his composition of music to

vernacular texts shows that he lived at least a few years longer. Morley, writing *A Plaine and Easie Introduction to Practical Musicke* (1597), mentioned Okeland as one of the composers whose work he had consulted.

Okeland's four-voice Kyrie occurs in a series of Kyrie and Alleluia settings in the Gyffard Partbooks (*GB-Lbl* Add.17802–5). In this freely composed work he demonstrated a fine technique within a clearly defined tripartite structure. His remaining works – the anthem *Prayse we the Father* and the prayer *Prayse we the Lord O our Souls* – are both contained in two of the earliest sources of Anglican music: the Wanley Partbooks (*c*1550; *Ob* Mus.Sch.E.420–22) and Day's *Certaine Notes* (1560, 2/1565). Although Okeland treated these texts syllabically, he indulged in a surprising amount of melodic movement, rhythmic variety and imitative part-writing. Both pieces were included in James Burns's *Anthems and Services* (London, 1847).

S. DIANNE BISHOP/ROGER BOWERS

Okeover [Oker], **John** (*b* ?Wells; *d* Wells, by July 1663). English organist and composer. He was probably a son of John Okeover (*b* ?Worcester, ?1595; *d* Wells, *c*1649), organist and vicar-choral at Wells Cathedral from February 1620, and later Master of the Choristers there, who obtained the Oxford BMus in 1633. Okeover the younger became organist of Gloucester Cathedral on 25 April 1640 (his name appears in account books there as early as 1635). At this time the cathedral gained a new organ built by Thomas Dallam, and the instrument was appraised by Thomas Tomkins, who occasionally visited the cathedral between 1639 and 1641, and whom Okeover would have met. In 1642 Okeover married Mary Mills, and they had a son John in 1656. In 1651 Okeover's distressed circumstances had attracted attention; although he was sympathetic to the parliamentary cause, he became an almsman on the former cathedral foundation in 1655, and remained so until the Restoration, when he moved to Wells. In July 1663 the name of John Browne, his successor as organist at Wells, replaced his in the cathedral accounts. Between 1664 and 1665 Mary Oker received payment for their son, who was one of the choristers.

Okeover's reputation was evidently local rather than national: his consort music appears only in the manuscript collections of the Gloucester copyist, John Merro (*d* 1639), and at no point does Okeover's name appear in any Chapel Royal documents. However, he was clearly aware of the work of some of the foremost court composers, since anthems by Byrd, Gibbons and others occur in significant quantities in a manuscript partbook that he compiled while at Gloucester (in *GB-GL*).

Only one of Okeover's church compositions, the four-part full anthem *Grant, we beseech thee, merciful Lord*, survives intact. Significantly, several of the manuscript sources of his four surviving anthems have West Country associations, suggesting that, like his consort output, his sacred music was not widely circulated. None is preserved in contemporary printed anthologies such as John Barnard's *Selected Church Music* (London, 1641) and James Clifford's *The Divine Services and Anthems* (London, 1663), although one of the Gloucester sources is a manuscript copy of Barnard, to which some handwritten additions were made, including Okeover's incomplete verse setting of psalm 21, *The king shall rejoice*. So far as can be determined from the small quantity of his sacred music that survives, Okeover was quite conservative, building his structures out of a succession of well-turned imitative paragraphs, reminiscent of the work of his immediate predecessors, Morley, Gibbons and Weelkes, though without their idiomatic or compositional flair; the opening of *The king shall rejoice* closely resembles that of John Tomkins's full setting of the same text.

While not perhaps in the front rank of 17th-century English consort music, Okeover's work compares favourably with that of his more eminent contemporaries, Coprario, Ferrabosco, Lawes and Jenkins. His three-part fantasias are fine pieces, featuring memorable opening themes, subsequently developed in expertly crafted counterpoint and revealing a sound – though conservative – harmonic sense. Structurally these pieces are similar to his anthems, comprising a series of imitative paragraphs and typically reaching a climax of rhythmic activity about two-thirds of the way through. The influence of Gibbons's printed three-part consort fantasias is sometimes evident, for instance in terms of registral disposition of the forces and presence of sesquialtera episodes. Okeover's treble parts (in both the three- and five-part fantasias) generally lie quite well on the violin (as do those of, for instance, Gibbons and Tomkins), while his bass parts are notably active, at times traversing patterns more suggestive of the keyboard than the viol.

WORKS

God shall send forth, verse anthem, *GB-GL*, *Lcm*, *Ob*, *US-BEm*: all inc.
Grant, we beseech thee, merciful Lord, full anthem, *GB-GL*, *Lcm*
Hear my prayer, O God, full anthem, *GL*, *Lcm*: both inc.
The king shall rejoice, verse anthem, *GL*, *Lcm*: both inc.
17 fantasias: 10 for 3 viols, *Ob*; 7 for 5 viols, *Lbl*
2 pavans, 5 viols, *Lbl*

Oktōēchos (Gk.: 'eightfold sound'). The system of the eight 'church modes' (the 'musical' *oktōēchos*) in the medieval Latin, Byzantine, Slavonic, Syrian, Armenian and Georgian repertories of Christian liturgical chant. Also, by association, the practice of grouping chants by mode (the 'calendric' *oktōēchos*) so that they can be sung in numerical order over a period of time, usually one mode per week, proceeding to the next higher number each Sunday and beginning with the 1st mode again when the 8th is completed. And a book (the 'liturgical' *oktōēchos*) in which the chant texts are grouped by mode in numerical order to facilitate performance according to the calendric *oktōēchos* (*see* LITURGY AND LITURGICAL BOOKS, §IV, 3(viii)); books also exist in which chants are arranged according to mode but without regard to a calendar, notably the Western TONARY and the Byzantine HEIRMOLOGION).

Although many theories regarding the origins of the eight-mode system have been proposed, the earliest genuine evidence of the musical *oktōēchos* dates from the 8th and 9th centuries CE. The modes appeared during this period in all the Eastern and Western chant repertories that use them, and the evidence consistently points to an origin in the milieu of Greek-speaking Palestinian monasticism and the closely related liturgical tradition of Jerusalem. The earliest extant collections of modally ordered chants include a series of Proper chants for the Jerusalem Mass in *RUS-SPsc* (Thibaut, 1913, pp.17–30; text on pp.3*–11* of 'Documents' section) and a list of *prokeimena* ('gradual' chants; *see* PROKEIMENON) and *allēlouïaria* in the Palestinian appendix to the Typikon of the Great Church of Hagia Sophia in Constantinople (Mateos, 1963, pp.175–7). Eightfold cycles of chants for the Resurrection Office, celebrated every Sunday in the Church of the Holy Sepulchre, Jerusalem, formed the nucleus of the liturgical book known as the Great Oktōēchos or Paraklētikē, traditionally ascribed to John Damascene (*d c*749), a monk at St Sabas monastery near Jerusalem. More securely connected to the milieu of John Damascene are the many *kanōnes* (hymns based on the biblical canticles; *see* KANŌN) composed by him and his fellow monks at St Sabas. The model stanzas (*heirmoi*) that provided the melodies for these chants were collected in the heirmologion.

The earliest manuscripts of the Georgian liturgical books corresponding to the Great Oktōēchos and the heirmologion are important witnesses to the processes by which these collections were assembled; the same is true of the Slavonic heirmologion. The origins of the Armenian *oktōēchos* appear to be connected with the importation of the *kanōn* repertory in the 8th century by Hellenophile Armenians. In the Syrian liturgical traditions the use of the eight modes was also originally associated with Greek genres of hymnody, and the *oktōēchos* is known to this day only in the two Syrian traditions that are most dependent on Greek models – the Melkite or Antiochian, and the West Syrian or Jacobite. The two other Syrian traditions – the Lebanese Maronite and the Assyrian or Nestorian – betray no evidence of the *oktōēchos*; nor does the Ethiopian liturgy, the only other Christian tradition based on a Semitic language. Theories that the *oktōēchos* was ultimately of Syrian or Semitic origin, therefore, cannot be sustained. The few Coptic sources that show an awareness of the *oktōēchos* are easily explained as reflecting Greek influence.

The eight modes first appear in Western sources in the St Riquier Tonary (*F-Pn* lat.13159) dated between 795 and 800 (Huglo, 1971, pp.25–9). Like the early Palestinian sources, it is a simple list of texts for the Proper of the Mass, arranged according to their modal number. The adoption of the *oktōēchos* in the West was clearly part of the Carolingian effort to standardize the melodies of the emerging Gregorian chant repertory. Other Latin chant traditions, such as the Old Roman and Ambrosian (Milanese), made no use of the musical *oktōēchos*, and no Western tradition has ever followed a calendric *oktōēchos*. The Western numbering of the modes differs from the Eastern practice (see Table 1), suggesting that the Latin Church had access to a rather primitive form of the *oktōēchos*, in which authentic and plagal modes alternate rather than being grouped separately (i.e. the authentic modes first, then the plagal). Some early Syrian sources are also organized according to the principle used in the West, but their numbering is different. Western sources preserve the earliest surviving evidence of the *ēchēmata* (*see* ĒCHĒMA), which in the Byzantine tradition may have been sung at the beginning of each chant to help the choir become attuned to the mode; the *ēchēmata* would thus have simultaneously fulfilled the functions of the Western intonation formulae and *differentiae* (*see* PSALM, §II).

Efforts to formulate a coherent music theory integrating the *oktōēchos* with terms and concepts borrowed from the writings of classical antiquity seem to have begun immediately in the West but only later in the East. The ultimate success of the Western synthesis created the false impression that the medieval *oktōēchos* was inherited directly from ancient Greece. A comparison of the Western theory with the two medieval Byzantine syntheses associated with the treatises known as the *Hagiopolitēs* and the PAPADIKĒ confirms the abundant musical evidence that the familiar modal names 'Dorian', 'Phrygian' etc., which medieval scholars attached to the modes of the *oktōēchos*, have nothing to do with the original use of these names to designate ways of tuning the ancient Greek lyre. Table 1 illustrates the different usage of the Greek names within the Western and Byzantine classifications.

There is no early evidence to suggest that numerology influenced the fixing of the number of modes at eight; the 4 × 2 structure of the *oktōēchos* is more probably the result of musical considerations. The musical characteristics of the Latin, Greek, Slavonic, Syrian and other modes have diverged so much that it is difficult to uncover the original logic of the modal system; yet the outlines of the earliest *oktōēchos* can be broadly defined. The core of this system may have been the four-note tetrachord with a semitone in the middle, corresponding to the modern pitches D–E–F–G; to complete the octave, this tetrachord was duplicated immediately above, on A–B–C–D. Melodies belonging to the Western 'authentic' or Eastern 'main' (Byzantine *kyrios*) categories of mode were those with a relatively high ambitus that ascended into the upper tetrachord; melodies that tended to remain in the lower tetrachord or that descended below it were classified as 'plagal'. In Byzantine chant to this day authentic melodies often cadence on a final in the upper tetrachord, and plagal melodies in the lower one. This pattern was also followed in early Western chant, but over the centuries the final in the lower tetrachord was gradually accorded

precedence. The other Eastern traditions appear to be less concerned with linking each mode to a specific final.

The original tuning of the modal tetrachords is a particularly vexed issue. The Western and Slavonic modes have become relatively diatonic, in keeping with the general characteristics of West European music; the use of B♭ in Gregorian chant is explained as a survival or revival of the *synēmmenōn* tetrachord of ancient Greek theory. Modern Greek, Syrian and Armenian chant, however, use microtones and other features that recall the *maqām* principle of Arab and Turkish music, although in Byzantine theory such characteristics are explained as deriving from the ancient Greek enharmonic and chromatic genera. The traditional opinion among Western musicologists that the Greek modes were originally diatonic, like their Western counterparts, and that their chromaticism is a recent development due to Turkish influence is probably overstated. Because of Islamic restrictions on music making, musicians in Ottoman courts tended to be Greeks and other Eastern Christians, who may thus have played a significant role in the creation of Middle Eastern musical cultures. And recent research into Western chant has drawn attention to the large number of chromatic and other modally ambiguous chants that circulated in the early Gregorian repertory. It seems that the *oktōēchos*, even in earliest Palestinian sources, was originally a descriptive system for classifying melodies that already existed. Only gradually did it develop into a prescriptive system governing the creation of new melodies, and in each tradition this process followed its own path. This explains why every tradition has supplemented the *oktōēchos* with additional categories for melodies that do not fit well into any of the eight modes, for example, the Western *parapteres*. Scholars of the Western chant traditions have been particularly keen to identify the musical characteristics that predate the importation of the *oktōēchos*: pentatonic (Chailley), recitation tone (Claire) and 'quartal and tertial chain' (van der Werf) structures have been variously discerned. Yet in each of the Eastern and Western traditions that adopted the *oktōēchos*, centuries of effort were expended by theorists, composers and editors seeking to make it into an all-encompassing system that fully accounted for the characteristics of the musical repertory. The *oktōēchos* has thus provided a dynamic impetus to the historical development of music in many cultures.

PETER JEFFERY

Okudzhava, Bulat (*b* Arbat region, Moscow, 1924; *d* Paris, 1997). Russian poet, writer and singer of Georgian origin. Okudzhava was the founder of a new popular genre known as *gitarnïye pesni* ('guitar songs') or *avtorskiye pesni* ('author's songs', songs composed by singer-songwriters) which became a new 'folk' tradition. Before *perestroika* these songs were published on cassettes by the underground *magnitizdat* or *samizdat* press and were widely sung by young people as an expression of opposition to authoritarianism. Okudzhava was one of a group of singer-songwriters or 'bards' (*bardy*) which also included Aleksandr Galich (1918–77) and Vladimir Visotsky (1938–80); they acknowledged Aleksandr Vertinsky (1889–1957) as the father of the new genre. At the beginning of the 21st century this genre continues to flourish, notably through the work of Zhanna Bichevskaya; her arrangements of village and urban Russian songs sound like American country music and have become a musical symbol of ideological opposition to official Soviet culture.

IZALY ZEMTSOVSKY

Ólafsson, Björn (*b* Reykjavík, 26 Feb 1917; *d* Reykjavík, 31 March 1984). Icelandic violinist and teacher. From 1931 to 1939 he studied in Vienna with Franz Mairecker (violin) and Ernst Moravec (viola). In 1947 and 1948 he studied with Adolf Busch in New York. In 1939 he was appointed a professor of violin and head of the string section at the Reykjavík College of Music. As a performer Ólafsson was continually active in Icelandic musical life. He gave the first performances of many works by Icelandic composers, and was the leader of the Iceland SO from its inception in 1950 until 1973, when he resigned so that he could devote his time to teaching. He was a Grand Knight of the Icelandic Order of the Falcon and Knight of the Danish Order of Dannebrog.

AMANDA M. BURT/R

Olagnier [née Joly], **Marguerite** (*b* 1844; *d* Paris, 12 Sept 1906). French composer, novelist, poet and singer. She began her musical life as a singer at the Théâtre des Variétées in Paris, leaving to travel to Egypt with her husband Eugène Olagnier. Possibly while abroad she wrote both words and music of an exotic opera in four acts, *Le Saïs*, which was staged at the Théâtre de la Renaissance in Paris on 18 December 1881. Later in life she directed her own company, the Théâtre de l'Oratorio, in weekly performances of 18th- and 19th-century oratorios. Two more operas, *Le Persan* and *Lilipa*, were never performed, and a novel remains unpublished. Olagnier also wrote a number of songs.

Le Saïs is, in form and genre, a hybrid of late 19th-century operetta and *grand opéra*, comprising short, strophic numbers and longer, complex forms. The work also draws on traditions of French exotic opera composition: in the Scène du Hachich (1.v), as the cast sit at the foot of a pyramid drinking hashish, chant-like vocal lines, repetitive rhythms and drones conjure an image of the orient. Critics of the time saw *Le Saïs* as excessively erotic, a view which to some extent holds true today: the heroine, for instance, wears a transparent gown and in Act 2 tantalizingly steps off stage to take her bath.

LUCIE MIDDLEMISS

Olagué [Olaegui], **Bertolomeu de** (*d* Santiago de Compostela, Feb 1658). Spanish or Portuguese composer. His name suggests possible Basque origin. The only known facts about him are that on 20 June 1644 he was named *maestro de capilla* at Burgos Cathedral, and that he was appointed to the same position at the cathedral of Santiago de Compostela in March 1651. 24 organ pieces by him survive (*P-Pm* 1577, Loc. B, 5, *Libro de cyfra …*): 11 tientos (called 'obra' or 'registro'), five entradas, three sets of versets for each ecclesiastical tone, two hymns, one *jácara*, one *toada* and one *canção* (*canción*). All are transcribed by Hudson and one appears in M.S. Kastner, ed.: *Silva ibérica de música para tecla de los siglos XVI, XVII y XVIII* (Mainz, 1954), i. There is also at least one Missa (for 9 voices), and an inventory of *c*1715 lists another one for eight voices (both in *E-Zac*; the latter has not been confirmed). He also composed three Christmas villancicos. Additional works are reported at *E-SE*.

BARTON HUDSON

Olah, Tiberiu (*b* Arpăşel, Maramureş district, 2 Jan 1928). Romanian composer. At the Dima Conservatory, Cluj (1946–9), he studied theory with Juliu Mureşianu, harmony and counterpoint with Max Eisikovits and the piano with Gheorghe Halmoş; he continued his studies at the Moscow Conservatory (1949–54) under Yevgeny O. Messner (composition) and Dmitry R. Rogal-Levitski (orchestration). In addition he participated in the Darmstadt summer courses (1966–72), where several of his compositions (e.g. *Columna infinită, Invocatii)* were performed. In 1969–70 he was composer-in-residence at DAAD, Berlin, where he embarked on a study of time and space in music.

Olah's music is based on an original modal system. He uses numerical sequences and proportional structures that join in an homogenous whole, leaving free certain characteristics of traditional Romanian music. His works use a continuous variation technique capable of generating work cycles such as *Brâncuşi* and *Harmonies*. In *Harmonies II* (1976) processed material is superimposed on original ideas, enabling the work's superposition on itself. In *Harmonies I* and *III*, using tape or a second orchestra, new material is interspersed with passages from works of the same cycle. This conception of musical space and time is discussed in his studies of the music of Webern and Enescu.

Olah has played an important role in the development of national cinematography. Two of his film scores, *Răscoala* ('The Uprise', based on a 12-note sequence G♭, B♭, D, F – A, C♯, E, G♯ – C, E♭, G, B) and *Mihai Viteazul* ('Michael the Brave') were highly acclaimed at the International Film Festival, Moscow, and have subsequently become successful concert pieces in their own right. Olah's musicological writings include a study of polyheterophony in Enescu's music and the organization of Webern's pre-serial harmonic language; both display a highly original point of view. He was awarded the Prize of the Romanian Academy (1965), the Koussevitzky Prize (1997) and first prize of the Romanian Composers' Union (1993) for a lifetime's achievement and several prizes of the Romanian Composers Union.

WORKS

(*selective list*)

DRAMATIC

Geamgii din Toledo [The Glaziers of Toledo] (television opera, B. Andor), 1970 [from puppet theatre, 1959]

Film scores: The Avalanche, 1959; Străzile au amintiri [Street memory], 1961; Sărutul [The Kiss], 1964; Comoara din Vadul Vechi [The Treasures of Vadul Vechi], 1965; Castelanii [The Castle-Owners], 1966; Meandre [Meanders], 1966; Zodia fecioarei [Virgo], 1966; Răutăciosul adolescent [A Mischievous Adolescent], 1969; Mihai viteazul [Michael the Brave], 1970; Puterea şi adevărul [Power and Truth], 1971; Decolarea [The Take-Off], 1971; Moartea lui Ipu [Ipu's Death], 1972; Pe aici nu se trece [No Trespassing], 1974; Osânda [The Condemnation], 1976; Trecătoarele iubiri [The Passing Loves], 1977; Independenţa [Independence], 1977; Munţii în flăcări [The Burning Mountains], 1980; La răscrucea marilor furtuni [At the Crossing of the Great

Storms], 1980; Convoiul [The Convoy] 1981; Cine iubeşte şi lasă [Who Loves and Leaves], 1982

VIOREL COSMA

Ölander, Per [Pehr] **August** (*b* Linköping, 8 Jan 1824; *d* Stockholm, 3 Aug 1886). Swedish composer. He was largely self-taught as a composer, but took lessons with J.E. Nordblom while a student at the University of Uppsala. Although his main employment was as a civil servant, he was active as a music critic and as a violinist. He composed his first opera, *Blenda* (4, L. Josephson and E. Wallmark; *S-Skma**), for a competition organized by King Oscar II. It was staged at the Royal Opera, Stockholm, in 1876 but remained in the repertory only until 1879. The work met with some criticism, owing to its poor libretto (based on Schiller's *Die Jungfrau von Orleans*) and its lack of originality. However, the composer's lyric and melodic gifts as well as the dramatic power of certain scenes were much acclaimed, and unique in Swedish 19th-century opera. The opera deals with a war in the early medieval period between the Danish and the Swedish. Despite the Wagnerian overtones of the plot, Ölander skilfully sets the most dramatic scenes with precision, colourful orchestration and a sense of the musical drama. His lyricism and intensity are often reminiscent of Bellini. Ölander's other dramatic work, the operetta *Mäster Placide* (T. Merula, Stockholm, New Theatre, 1879, lost; ov. in *Skma*), was rather more successful than *Blenda*, perhaps owing to its lightness and comic verve – both rare in Swedish theatre. His other compositions include a Symphony in E♭; a *Missa solemnis*; two psalm settings for solo voices, chorus and organ; a string sextet; several quartets; men's choral songs and solo songs.

ANDERS WIKLUND

Olatunji, Babatunde [Michael Babatunde] (*b* Ajido-Badacry, Nigeria, *c*1920). Nigerian drummer, composer and music organizer and promoter. Educated at the Baptist Academy in Lagos, he moved to the USA in 1950 where he took the BA at Morehouse College in Atlanta, Georgia, in 1954. He settled in New York in 1954, enrolling in a graduate programme at New York University, and later established the Center of African Culture in Harlem in the 1960s, a cultural performing arts school. He collaborated with artists such as John Coltrane, Max Roach, Yusef Lateef, Freddie Hubbard, Sonny Rollins, Jerry Garcia and Mickey Hart. His recordings and touring ensemble introduced countless audiences throughout North America and the world to West African performance traditions. In addition, he wrote about African music and composed several film scores. His association with Grateful Dead drummer Mickey Hart led to several recording projects and further performing opportunities.

GREGORY F. BARZ

Olcott, Chauncey [Olcott, Chancellor John] (*b* Buffalo, NY, 21 July 1858; *d* Monte Carlo, 18 March 1932). American singer, composer and lyricist. He toured with several minstrel and opera companies, then went to London for two years, where he studied singing and appeared in comic opera. He achieved fame after his return to the USA when he joined forces with Augustus

Pitou in 1893 and succeeded William J. Scanlan as the leading singer in Pitou's productions of sentimental operettas on Irish themes. His success, founded on his sweet tenor voice and his ingratiating acting and appearance, led to his concentrating on Irish roles for the remainder of his career.

He contributed librettos, songs and lyrics to many of the works in which he appeared, and wrote the complete scores of *Sweet Inniscarra* (1897), *A Romance of Athlone* (1899), *Garrett O'Magh* (1901), and *Old Limerick Town* (1902). His song *My Wild Irish Rose* (1899) and the lyrics *Mother Machree* (1911) and *When Irish Eyes are Smiling* (1912), both with music by Ernest R. Ball, have attained lasting popularity. He made a few recordings of Irish-American ballads between 1913 and 1920, but his popularity waned after World War I and he retired in 1925. Olcott was considered neither a great singer nor actor, but at the height of his popularity commanded a large and loyal audience among the Irish-American community. His life was the subject of the Hollywood film *My Wild Irish Rose* (1947).

MICHAEL J. BUDDS

Olczewska, Maria. *See* OLSZEWSKA, MARIA.

Oldfield, Mike [Michael] (*b* Reading, 15 May 1953). English rock composer and guitarist. At the age of 19 he recorded the instrumental album *Tubular Bells*, funded by Richard Branson's Virgin record shops. In 1973 it became Virgin Records' first release and sold more than ten million copies over the next eight years. Written with the help of David Bedford, it was a quasi-minimalist piece at the melodic end of progressive rock. From this position he subsequently wrote and performed music for the eve of the Prince of Wales's wedding in 1981 and film music for Puttnam's *The Killing Fields* (Virgin, 1984).

The achievement of *Tubular Bells* was such that in 1992 he released *Tubular Bells II* (WEA), which showed an attempt to evade the new-age tag his music had acquired; this was strengthened by a remix by dance outfit The Orb. Between these two, Oldfield recorded a dozen largely instrumental albums: *Hergest Ridge* (Virgin, 1974) was in the style of *Tubular Bells*; the more lively *Ommadawn* (Virgin, 1975) showed some influence of Celtic melody; the single *Guilty* (1979) toyed with disco; *The songs of Distant Earth* (WEA, 1994), based on Arthur C. Clarke's novel of the same name, made use of Gregorian and Central Asian chant. He has worked with musicians on the cusp of the divide between pop and classical music, including Bedford, Morris Pert and Jon Anderson, and also those involved with progressive rock, such as Kevin Ayers and Roger Chapman, and has successfully jumped the chasm opened by punk. He is somewhat introverted and largely uninterested in the theatrical possibilities of live performance, not touring until 1979. Like many of his generation, Oldfield has retained a strong following in Germany, Spain and France.

ALLAN F. MOORE

Old Hall Manuscript. The most important manuscript collection of English sacred music of the late 14th and early 15th centuries, until 1973 at the college of St Edmund, Old Hall, near Ware, Hertfordshire, and now *GB-Lbl* 57950.

1. Compilation and contents. 2. Date and provenance. 3. Musical styles.

1. COMPILATION AND CONTENTS. The main compilation (OH-I) was put together between about 1415 and 1421 by a single scribe and presents for the first time an English repertory largely tied to named composers: Leonel Power, with 20–26 compositions, Pycard, Typp, Byttering, Oliver, Chirbury, Excetre, Cooke, Roy Henry, Queldryk, Tyes, Aleyn, Fonteyns, Gervays, Lambe ..., Mayshuet, Pennard, Rowlard and Swynford (in approximate descending order of representation). Antonio Zacara da Teramo can be added on the strength of continental concordances: a Gloria elsewhere ascribed to him with a texted contratenor may have been imported through the Council of Konstanz, where English musical prowess was noted. Mayshuet (probably Matteo de Sancto Johanne, in England in 1369: Wathey, 1990) is credited with one of the two *Deo gratias* substitute motets that end the manuscript; he may also have written the other, also preserved in a younger English choirbook (Bent, 1984) and textually connected to a *Post missarum solemnia* in *I-IV*. Harrison's suggestions for other foreign identities are thinly based: that Rowlard may be Philippus Royllart, composer of the motet *Rex Karole/Leticie pacis*, and that Fonteyns may be a canon of the Ste Chapelle in Paris. Aleyn has been identified with Johannes Alanus, the English composer of *Sub Arturo plebs* (probably a royal chaplain who died in 1373), but the Old Hall composer's initial, for an erased Agnus, appears to be W. Equally uncertain is whether the 'J de Oxonia' of that motet is the same as the royal clerk John Excetre (1372–97) or the Old Hall composer. Later additions (OH-II) in some seven hands, of music by Damett, Sturgeon, Cooke, Burell, Forest and Dunstaple, were made in the early 1420s on openings left blank by the main scribe and on leaves newly inserted.

The collection is arranged by liturgical category: settings of the Gloria, of antiphons and sequences in score, of the Credo, Sanctus and Agnus Dei, and of isorhythmic motets including *Deo gratias* substitutes. Within each section devoted to the Mass Ordinary, settings in score precede those notated in parts. There is further evidence of planning within sections, notably the ordering of Sanctus and Agnus Dei settings according to their plainchants. Roy Henry's two compositions, a Gloria in separate parts and a Sanctus in score, head their respective sections. The later scribes made their additions as far as possible in accordance with this plan, which follows the order of Mass (thus physically separating musically related movements which in later manuscripts tend to be grouped together). Even the motets of this 'second layer' which are 'misplaced' in the Sanctus section might be treated as Sanctus sequels. (*See* DAMETT, and STURGEON, N.)

Opening of the Gloria by Roy Henry from the Old Hall Manuscript (GB-Lbl Add.57950, f.121v)

Barclay Squire dismissed the possibility of making a bibliographical collation, but this has now been established with almost complete certainty. The details in many cases disprove older hypotheses about the order of compilation and associated datings, and establish beyond any doubt which leaves were later additions to the original book and how many leaves have been lost – the latter being a minimum estimate, since there may originally have been a gathering of Kyries. Discounting this possibility, the manuscript was originally planned to have at least 121 folios, 98 of which survive, though 15 of these were used for later additions instead of the pieces intended by the original scribe. 14 out of at least 16 inserted leaves remain, making an original total of 137 folios of which 112 are left. The original scribe was responsible for about three-quarters – the first layer – of the manuscript as it now survives. The later contributors, notably Damett and Sturgeon or their agents, did not collaborate in the original compilation. The second-layer scribes themselves used the music of the first layer, as

their alterations to it show. Substantial rewriting activity by these later scribes on their 'own' music, and the simultaneous membership of four of them of the Royal Household Chapel of Henry V, suggest that some pieces were autograph. The composers affected are Damett, Sturgeon, Cooke and Burell. (Although the Forest and Dunstaple works also have their own scribes, similar evidence of personal intervention is lacking.)

2. DATE AND PROVENANCE. Discussion of the early history of the manuscript has been plagued by misunderstandings, including failure to distinguish between the date of composition of the music and the date of copying of the manuscript; confusion between the layers of activity led to the inverted notion that Damett and Sturgeon may have been actively concerned in the original compilation; and confusion between the Royal Free Chapel of St George in Windsor Castle and the peripatetic Royal Household Chapel of the king (exacerbated by Damett's and Sturgeon's associations with both at various dates): this led the manuscript, entirely by virtue of the later additions, to an unjustified association with the Chapel Royal. While a Chapel Royal association for the second layer is almost certain, the nature of the interruption of the original plan pointed to an origin for the first layer outside the royal chapel.

Interest and controversy have surrounded the identity of ROY HENRY. Henry VI (Squire) and Henry IV (Harrison) can now be ruled out in favour of Henry V (Bukofzer; Bent, 1984), who was king at the time of writing, especially since the discovery that LEONEL POWER (Bowers) was a member of the chapel of Henry V's brother Thomas Duke of Clarence (*d* 1421), for whose chapel the manuscript can now be presumed to have been prepared and whence it passed to that of Henry V, whose chaplains stayed on to attend the infant Henry VI, adding their own compositions. Some of these may be autograph, and they include three motets by Damett, Cooke and Sturgeon whose titles correspond closely to a contemporary chronicle account of the London festivities following the Agincourt victory in 1415 (Bent, 1967–8). But it is the royal anchorage of OH-I that invites a marginally later dating of the copying than that previously proposed; the absence of Dunstaple (except for the sole later, anonymous addition of his four-part *Veni Sancte Spiritus*) becomes more surprising as the date of the manuscript has to be advanced, given that he served various members of the royal family and was certainly composing by this time. He is, however, prominent in the aforementioned comparable but fragmentary royal choirbook of slightly later date (Bent, 1984; *see also* DUNSTAPLE, JOHN), which has significant overlaps with and repertorial advances on Old Hall.

The relationship between the early part of the repertory and its fragmentary English concordances and that between the later music and its mainly continental copies give an opportunity for relative stylistic definition which is lacking for the much more fragmentary and chronologically diffuse Worcester Fragments of *c*1300 (*see* WORCESTER POLYPHONY). The only earlier English repertories of comparable completeness are in the 11th fascicle of *D-W* 628 (677) = W1. The earlier date of manuscripts containing concordances to the oldest styles confirms their late 14th-century origin; the distribution of these concordances by provenance, and the geographical implications of some composers' names, suggest that the repertory was drawn from the widest possible field and was in no sense a local or provincial product, even though it may have included some individual local or provincial pieces. Many of the most complex and virtuoso pieces in the manuscript are *unica*, indicating a small circle of high cultivation that was also open to simpler styles culled from a wider range.

The provenance of the manuscript cannot be established from its subsequent history. There is some evidence to support ownership by James Strangman, a member of the Elizabethan Society of Antiquaries who died in 1595/6. It was bought in 1813 by John Stafford Smith, at the sale of the Rev. John Parker's library. The manuscript has flourished capitals in alternating gold leaf and blue. 19 were excised in the 19th century, including more decorative ones at heads of sections, causing loss of music on both sides of the affected leaves. Replacement patches were provided in the late 19th century, and some second-layer pieces received their first capitals at the same time, in spaces that had remained blank (Bent, 1966). The manuscript descended to E.W. Tordiffe, who donated it to St Edmund's College in 1893. On 29 July 1973 a private sale to the British Library was announced, after the manuscript had failed to reach the reserve price at Sotheby's.

3. MUSICAL STYLES. Stylistic classifications were made by Bukofzer and Hughes (1967), with subsequent refinements. The music notated in score (an English peculiarity at this date) includes chant-based (English discant) and free (cantilena) settings, though the range from homophonic to complex rhythmic styles embraces both. Where present, the plainchant is often in the middle part, cultivating contrary motion with the lowest voice but sometimes migrating to it; occasionally it is paraphrased in the top part. A chant may be used strictly, or freely paraphrased; the dividing line between 'discant' and 'cantilena' is a soft one. Imperfect time with major prolation is the most common mensuration, rarely signed unless, as in a few pieces, there is a mensural change. With the use of coloration and increasing rhythmic complexity, such pieces (e.g. Cooke's Gloria, no.7, and *Ave regina*, no.52, Oliver's Sanctus, no.119) might well have been notated in separate parts. Texting beneath the lowest part is aligned for singers, not for musical score-reading. Score pieces are always, here, in three parts; in two cases, an additional contratenor is notated separately. Two-voice score, found in other English sources, is here confined to a few internal duets.

The music notated in choirbook format, or separate parts, includes a number of mass movements that, although physically separated in the manuscript, can be paired on grounds of musical technique or structure. Pairs may have related chants but no common tenors. Tenor chants are proper to the text of the movement concerned, except in isorhythmic compositions, where they may be alien; a few pieces paraphrase their chant in the top part. Isorhythm is used for all the motets and some mass movements. It ranges from the fairly mechanical imposition of a short talea on a long tenor (as in no.85, which has 19 rhythmically similar sections), through flexible structures in which colour and talea do not always coincide (as in Leonel's paired Gloria and Credo, nos.24 and 84), to pieces fully isorhythmic in all parts with

successive colour reductions; this is at its most regular in the motets of OH-II.

Of seven canonic works (all in OH-I and several by Pycard) one is a double canon and two incorporate a canon 3 in 1 into a five-part piece. The exceptional number of five-part pieces here reflects the English predilection for multi-voice sonority; there is even one 3rd in a final chord (Leonel, no.21). Several compositions are essays in mensural and proportional virtuosity, with a wide range of colorations including black, red and blue full and void forms, reversed and coloured signatures, half-coloured notes and special signs, presupposing a high degree of sophistication among the intended users, the members of Clarence's chapel including Power himself.

Much of the remaining music notated in parts is dominated by a texted songlike top part, often quite florid, supported by a grammatically essential tenor paired with a contratenor in the same range. In other styles, text declamation is shared (sometimes in alternation) between two upper parts, supported by an accompanying tenor, with or without a contratenor. There is some textual compression by telescoping, but no omissions.

The music of OH-II displays the suave consonance and melodic elegance associated with the generation of Dunstaple and often labelled the *contenance angloise*. There is a higher proportion of duet writing, and withdrawal from the extreme rhythmic complexity of OH-I works by Leonel and Pycard.

MARGARET BENT

Oldham, Arthur (William) (*b* London, 6 Sept 1926). English choirmaster and composer. He studied composition with Howells at the RCM (1943–5) and privately with Britten. The first of his works to attract public attention was the ballet *Mr Punch*, given by Ballet Rambert at Sadler's Wells. Since that time he has worked as a choirmaster with the Scottish (later Edinburgh) Festival Chorus (from 1965), the Scottish Opera Chorus and the LSO Chorus (1969–76). Also in 1976 he was responsible for the formation, in Paris, of the choir of the Orchestre de Paris, and later the chorus of the Concertgebouw Orchestra. An early compositional career under the shadow of Britten (inevitably so, when both were concerned to write choral music of immediate appeal) was interrupted in 1952 by a nervous breakdown. He recovered and began to compose again towards the end of the 1950s, at about the time he entered the Catholic Church. He was made an OBE in 1989. Much of his music is intended for children. The harmony is largely diatonic, its vitality deriving from an original use of dissonance and unexpected key juxtapositions.

WORKS
(*selective list*)

Orch: Variations on a Carol Tune, chbr orch, 1949; Divertimento, str, 1951; Circus Parade [suite from ballet Circus Canteen], 1952; The Apotheosis of Lucius, sym. study, 1952; Sinfonietta, wind band, 1974
Stage: Mr Punch (ballet), 1946; The Sailor's Return (ballet), 1947: Circus Canteen (ballet), 1951; ed., Love in a Village (op), 1952; Bonne bouche (ballet), 1952; The Land of Green Ginger (op), 1965
Choral: My Truest Treasure, SATB, 1951; 4 Occasional Anthems, 1952; Missa in honorem Santi Thomae Mori, SATB, 1958; Missa Sanctae Mariae Virginis, congregation, chorus, org, 1960; 2 Carols, SA, org, 1961; Laudes creaturanum (cant.), S, children's chorus, chorus, org, str, 1961; Hymns for the Amusement of Children, S, chorus, org/chbr orch, 1962; Remember, O thou Man, SSATBB, 1962; Blind Audley's Carol, SSATBB, 1965; Quem vidistis, STB, 1966; Sacerdos et pontifex, SATB, org, 1966; Now is the Time for Mirth and Play (C. Smart), unison vv, 1967; O Queen of Virtues, SA, 1967; Psalms in Time of War, Bar, chorus, orch, 1976; Epithalamium (Smart), chorus, org, 1989; Le testament de Villon, 3 solo vv, chbr choir, chorus, orch, 1997
Vocal: 5 Chinese Lyrics, 1v, pf, 1949; Summer's Lease (W. Shakespeare), T, str orch, 1950; The Commandment of Love, 1v, pf, 1951; Cantique de cantiques, 1v, fl, 1980; 5 Noëls, 1v, fl, 1997; 2 villancicos de Santa Teresa de Avila, S, Mez, pf
Chbr: Sonata, vn, pf, 1950
Arrs.: 5 Burns Songs, chorus, 1958; 6 Scots Songs of the XVIII Century, 1v, pf, 1959; 4 Noëls, SSA, 1963

RICHARD COOKE/R

Oldham, Kevin (William) (*b* Kansas City, MO, 30 Aug 1960; *d* Kansas City, MO, 11 March 1993). American

composer and pianist. He studied at Northwestern University and at the Juilliard School, where his teachers included Herbert Stessin and Sascha Gorodnitzki. He made his orchestral début with the Detroit SO under Kunzel in 1980, and throughout that decade presented highly regarded piano recitals in New York, Chicago, Washington, DC, and Los Angeles. In 1988, upon learning that he was infected with HIV, he abandoned the concert stage and devoted the rest of his life to composition. He checked himself out of a New York hospital to rehearse and perform his Piano Concerto with the Kansas City SO under William McGlaughlin in January 1993. The following day he was readmitted to a local hospital, where he died six weeks later.

Oldham's neo-romantic style combined the lush virtuosity of early 20th-century Russian music (by composers such as Rachmaninoff and Prokofiev) with a jaunty American manner that owed much to film scores and music theatre. The simple and haunting Andante tranquilo from his Piano Concerto has been especially admired. Several of his works have been recorded.

WORKS

Stage: Therese Raquin (op), unfinished; Titanic (musical theatre), unfinished

Vocal: 5 Songs, op.2: I am your Friend; Do I Know Why; Intermezzo, pf; Prelude, pf; Song Without Words in C; Gaspard de la nuit, 3 songs, op.3, S, pf: Ondine, Le gibet, Scarbo; 2 Waltzes, op.4, 3 S, pf, str qnt: Dingbat Waltz, Vocalise Waltz; 4 Songs, op.5: Will You Ever Dance to My Songs Again?, Pretending, All My Thoughts of You, Give me a Break; 4 Songs, op.11, S, unfinished; 5 Songs, op.12, Bar, unfinished; 3 Spirituals, op.13, unfinished; The Boulding Chorales, op.16, pubd: Can I Imprisoned; Small Flowers; Are there No Armies; My Lord, Thou Art in Every Breath I Take; 3 Carols, op.20, pubd: Away in a Manger, Joy to the World, Silent Night; 3 Pss: cxxi, cxxx, cl

Inst: Toccata, op.1, pf; 2 Inst Pieces, op.6; Variations on a French Noel, op.7, pf, pubd; Fuge, op.8, s cl, a cl, cel, pf; Sym. no.1, op.9, org, pubd; Pf Conc., op.14, pubd; 2 Nocturnes, op.15, pf; Ballade, op.17, pf, pubd; Prelude, Saraband and Toccata, op.19 [Toccata completed by S. Cohen] [see also VOCAL: 5 Songs, op.2]

Transcrs. of works by Bach (Sinfonia, D, BWV29; Fugue, G; Prelude and Fugue, D, BWV532), M. Duruflé (Org Suite, op.5)

TIM PAGE

Oldis [Oldys], **Valentine** (*b* 1620; bur. London, 22 June 1684). English apothecary, poet and amateur composer. His father, also Valentine, had him educated at Cambridge. According to Anthony Wood he was 'an Apothecary in the Blackfriars in London in the time of the rebellion'. He published a poem in praise of the Restoration, and contributed to other collections, including Alexander Brome's *Songs and other Poems* (London, 1664). He was made a Cambridge Doctor of Medicine by the king's warrant on 6 October 1671, and became an honorary member of the College of Physicians in 1680. He was buried in St Helen Bishopsgate. Apart from two two-part suites in Playford's *Court Ayres* (RISM 1655[5]), all of his music is found in a Bodleian Library manuscript (*GB-Ob* Mus.Sch.G.612; for details see *DoddI*), which Edward Lowe noted was 'given mee by the Author 24th march 1659 [?1660] at ye Legge in Kings-Street Westminster'. It contains four suites for two trebles and bass, a fifth for three trebles and bass, the bass part of a sixth, and a seventh suite of three-part 'ayres alamode made in ye yeare 1674' added later by Lowe. Lowe copied the first six suites into another manuscript (*Och* Mus.382–4), and the 1674 suite also appears elsewhere (*Ob* Mus.Sch.C.44 and E.451). Oldis's music is fluent and attractive in an old-fashioned idiom reminiscent of Jenkins's lighter middle-period works.

PETER HOLMAN

Oldman, C(ecil) B(ernard) (*b* London, 2 April 1894; *d* London, 7 Oct 1969). English librarian and bibliographer. He read Greats at Oxford and entered the British Museum in 1920 as an assistant keeper in the Department of Printed Books, working there until his retirement in 1959. Through general scholarship and an outstanding capacity for administration, he rose to be head of the department, as principal keeper, for the last 12 years of his service.

Oldman's early interest in music brought him to the notice of Barclay Squire, who encouraged him to specialize in the bibliography of music, especially the music of Haydn, Mozart and Beethoven. Of Mozart in general he ultimately acquired an encyclopedic knowledge, and his work was recognized in 1950 by the award of the silver medal of the Internationale Stiftung Mozarteum. One of the most notable results of Oldman's intensive study was 'Musical First Editions' (1934), an exceptionally lucid statement of principles and aims, with particular reference to the Classical period. But the pressures of departmental work grew continually in the 1930s and the problems that arose through war damage and postwar reconstruction made it difficult for him to complete any substantial work. He was however generous in sharing his knowledge with others working in the same field.

During his term as principal keeper, Oldman acted as honorary curator of the Royal Music Library, for which he was appointed CVO in 1958. For his work as principal keeper he received the CB in 1952, and his services to musical scholarship were recognized by an honorary doctorate from Edinburgh University in 1956. From 1945 to 1969 he guided the affairs of the British Union-Catalogue first as treasurer and from 1951 onwards as chairman. From 1962 until his death he was chairman of the UK committee for *RISM*. He was on the council of the Central Music Library in London from its foundation in 1946, and its chairman from 1964. He gave 37 years' service to the Royal Musical Association, as a member of its council and later as a vice-president, and was honorary librarian of the Royal Philharmonic Society from 1947 to 1969.

ALEC HYATT KING

Oldovini, Paschaly Caetanus (*fl* 1758–77). Portuguese organ builder. An inscription on the organ built for Évora Cathedral in 1758 confirms that he was of Italian origin. His work in Portugal, displaying a mixture of Portuguese and Italian traditions, is of a high quality and not much influenced by the then prevailing Baroque style. He apparently worked in Évora for a number of years on projects at the cathedral, where he restored the Renaissance organ (built by Heitor Lobo), and constructed two other organs, one in 1758 and a smaller Positiv of *c*1760. A small organ built for Crato parish church is dated 1769, and an impressive instrument, similar in design to the 1758 organ for Évora Cathedral, was installed in Elvas Cathedral in 1777. There is considerable evidence to suggest that the historic organ in Faro Cathedral was repaired by Oldovini, who, at the same time, may have installed its unusual *Brustwerk*. Faro Cathedral contains another small organ built by him, and an instrument in the chapel of Senhor dos Passos, S Matriz, Viana do Castelo, is almost certainly his work. For further information, see G. Dodener 'Eine portugiesische Kleinorgel des 17. Jahrhunderts', *Studia organologica: Festschrift für John Henry van der Meer*, ed. F. Hellwig (Tutzing, 1987), 45–56.

W.D. JORDAN

Old Roman chant. Old Roman chant is a liturgical repertory of melodies that survives in certain manuscripts dating from between the 11th and 13th centuries, but it must have existed in some form or other centuries before. Because of the nature of the source material, musical and historical, most scholarly discussions of Old Roman chant have related the repertory to the better-known Gregorian chant.

1. GENERAL. Three graduals and two antiphoners survive: one gradual from the church of S Cecilia in Trastevere in Rome written in 1071 (*CH-CObodmer* C 74); one gradual perhaps from S Giovanni in Laterano, Rome, from the 11th or 12th century (*I-Rvat* lat.5319); one gradual from S Pietro in Rome from the 13th century (*Rvat* S Pietro F 22); one antiphoner from an unknown Roman church, perhaps S Croce in Gerusalemme, written in the 12th century (*GB-Lbl* Add.29988); and one antiphoner from S Pietro, Rome, from the 12th or 13th century (*I-Rvat* S Pietro B 79). All the manuscripts are thus of Roman origin.

Textually and liturgically they conform to Gregorian sources except for minute but specific divergencies. The melodies are, in most cases, variations of the corresponding melodies in Gregorian chant. Thus we should speak of two chant traditions rather than of two bodies of chant. The textual and liturgical peculiarities of the five Roman manuscripts recur in some liturgical manuscripts without melodies (missals and ordinals); and on this basis it has been claimed that the existence of the Old Roman tradition can be traced back to the end of the 8th century. Some of the unnotated 'témoins indirects' (Huglo, 1954) are of non-Roman or northern provenance, and their relevance as witnesses of Old Roman chant has been challenged (Frénaud, 1959).

In the critical literature there is no single view as to what this chant tradition should be called. The name 'Old Roman chant' ('Altrömischer Gesang'), was introduced by Bruno Stäblein; initially he contrasted it with 'New Roman chant' ('Neurömischer Gesang'), but he later replaced this by returning to the concept of 'Gregorian chant'. Others speak of 'Urban Roman' and 'Gregorian' (Schmidt), 'special' and 'standard' (Apel), 'divergent' and 'normal' (Jammers), 'Old Roman' or 'Roman' and 'Frankish' (Hucke) traditions of Gregorian chant.

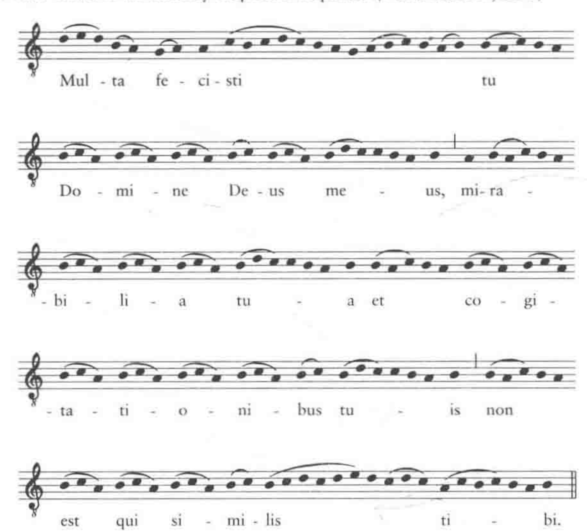
2. THE ORIGIN OF THE TWO TRADITIONS. The authors of the introduction to *Le répons-graduel Justus ut palma* (PalMus, 1st ser., ii, 1891/*R*), who published a melody of the Old Roman tradition for the first time, regarded this tradition as a later, urban Roman distortion of the Gregorian melodies. In 1912 Andoyer proposed the opposite view that older, pre-Gregorian versions of Gregorian melodies were preserved in the Old Roman tradition. Scholarly discussion of the Old Roman tradition was reopened in 1950 by Bruno Stäblein. According to Stäblein the Old Roman tradition represents what was sung at the time of Pope Gregory the Great, that is, the true 'Gregorian' chant. Under Pope Vitalian (657–72) these melodies were subjected to an 'ingenious reshaping', the result of which is what we know as Gregorian chant.

The dating of this reshaping in the pontificate of Vitalian rests first of all on a tradition, repeated by various chroniclers since the 12th century, according to which Pope Vitalian was active in the field of liturgical chant. The second basis for this dating is a list, contained in an 8th-century Frankish manuscript (*Ordo romanus XIX*), of persons who had done much for the cause of Roman chant. The list starts by enumerating popes and closes with the names of three abbots (Catolenus, Maurianus and Virbonus) who were presumably affiliated with the basilican monasteries around S Pietro in Rome at the time of Vitalian. These three abbots were supposed by Stäblein to have taken part in the reshaping of Old Roman into Gregorian chant. The suggestion of Jammers that the transformation of the Old Roman melodies into Gregorian chants during the pontificate of Vitalian was occasioned by the introduction of drones (*ison*-singing or

diaphonia basilica) from Byzantium rests on no reliable evidence.

According to Van Dijk the relationship of Gregorian chant to Old Roman chant should not be considered solely from a musical point of view: above all it is a question of two different rites. In most of the papal services in the 13th century Gregorian chant was sung, while elsewhere in Rome, especially in S Pietro, the Old Roman rite was used with Old Roman melodies. Van Dijk offered circumstantial evidence that the special papal liturgy stretched back much further than the 13th century and that it had been connected with Gregorian chant from time immemorial. Gregorian chant was supposed (by Van Dijk) to have developed from the pontificate of Vitalian onwards and to have been codified by Pope Gregory II (715–31); Pope Vitalian supposedly founded the Roman Schola Cantorum.

Smits van Waesberghe, on the other hand, argued that the Old Roman chant was the chant of the papal liturgy, and that during the 7th century this chant was transformed into Gregorian chant in the monasteries that were linked with Roman basilicas. In connection with the liturgical and historical investigations of Huglo and with his own study of the graduals, Hucke formulated the thesis that the Old Roman chant was the Roman version of Gregorian chant and that 'Gregorian chant' originated in the Frankish Empire in about 800 with the introduction of the Roman liturgy there. He believed that, given the conditions of the 8th and 9th centuries, the transplantation of a vast and highly developed repertory of Gregorian melodies into a completely different musical culture was highly unlikely; in fact, the literary evidence relating to the introduction of the *cantus romanus* into the Frankish Empire speaks time and time again of difficulties and misunderstandings. Hucke's research into the antiphonal psalmody of the Old Roman sources indicates that the system of the eight psalm tones was not adopted by Old Roman chant until late, and then only incompletely. This would be inexplicable if Gregorian chant had arisen in Rome and been transmitted there since the 8th century alongside Old Roman chant. The system of the eight psalm tones, related directly to the eight church modes, is first attested in the Frankish Empire in about 800. It is clearly one of the achievements of the Carolingian Renaissance. The stylistic differences between old Roman and Gregorian chant must be explained by their different places of origin and by the adaptation of the Roman melodies to the system of the eight church modes.



According to Hucke, after the separation of the Frankish tradition in about 800 the Roman tradition continued to develop until the 11th century and underwent changes in some parts of the repertory more than in others. He maintained that the way in which the Old Roman tradition made Frankish elements its own excludes the possibility that the two traditions originated in the same place and in the same musical culture and co-existed from the beginning. The Old Roman tradition, exposed to the growing pressure of the Frankish tradition spreading from the Frankish Empire, was finally ousted by Gregorian chant in Rome in the high Middle Ages. Apel and Snow also accepted the Frankish origin of Gregorian chant, as did Cutter who, however, later pointed out that the relationship of the two traditions to each other could not be explained in all parts of the repertory by a revision of Old Roman melodies in the Frankish Empire. He suspected that Old Roman chant was transmitted orally for a long time and that this oral tradition was recorded in various Roman churches independently of each other.

Despite the fact that the liturgical practices of the papal court, of the urban churches and of the Roman monasteries each had distinctive features (Van Dijk), that alone would be insufficient evidence for the cultivation of two divergent musical styles in the same city. Apart from whatever apprenticeship training in music might have been available in the Roman tituli (*see* ROME, §II, 1), there existed in Rome only one singing school, the papal Schola Cantorum (Dyer, 1993). Gregorian chant must be, therefore, in some degree 'Frankish', although no agreement has yet been reached about the details of the process that created it. Some regard Gregorian chant as representative of 8th-century Roman chant imported into Charlemagne's realm and 'frozen' in the memories (and later manuscripts) of Frankish cantors. Others believe that a process of oral tradition continued for a time, as it most certainly did in Old Roman chant, preserved in written form only from the 11th century.

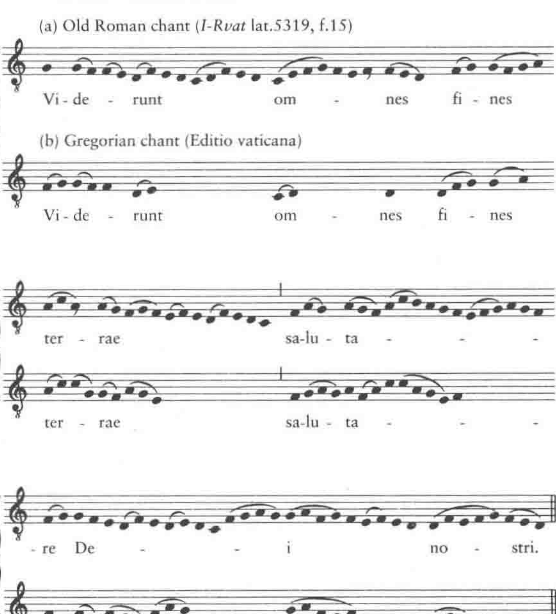
Various studies (Cutter, Nowacki) have demonstrated the fluidity of detail in the Old Roman melodic tradition, presumably the result of separate, independently written redactions of the oral tradition. Nowacki's investigation of antiphon texts set to different type melodies (Gevaert's 'thèmes') in the Old Roman and the Gregorian traditions led him to conclude that the reason for this phenomenon is not to be sought in Frankish confusion or error, but in the extended period of oral transmission at Rome. The process by which Old Roman chant was displaced by Gregorian chant at Rome must have been a gradual one, perhaps already underway when the *graduale* of S Cecilia in Trastevere was written (1071). The reformed canons of the Lateran and the papal court might have adopted this 'international' repertory during the 12th century, and there is some reason to suppose that it formed part of the liturgical reforms of Pope Innocent III (1198–1216). According to a late 14th-century report (Radulph de Rivo), the Old Roman rite and its music were officially suppressed during the pontificate of Nicholas III (1277–80).

3. OLD ROMAN CHANT STYLE. In speaking of the stylistic peculiarities of the Old Roman tradition the question must be answered as to whether these peculiarities are common to the different classes of chant or whether they occur predominantly or even exclusively in specific classes of chant. For example, the manner of recitation, often cited as being characteristic of the Old Roman tradition, in which a two-or three-note ornamental figure is reiterated continually (ex.1), occurs predominantly in the offertories. Generally the melodic style of Old Roman chant, like other Italian chant dialects, favours intricate, often repetitive melodic motion within a narrow pitch range; it makes considerable use of varied or literal reiteration of small melodic elements. The gentle rise and fall of the typical Old Roman melody contrasts strongly with the more angular and assertive Gregorian melodic profile. It seems clear that Old Roman chant relied heavily on formulaic construction, even if individual pieces stray from strict adherence to the formulae (Cutter, Connolly, Hucke, Nowacki).

A stylistic characteristic in the Old Roman tradition, or at least in the larger part of its repertory, seems to be the tendency to allow melismas and phrases to flow over the

Ex.1 Versus of the offertory *Exspectans exspectavi* (*I-Rvat* lat.5319, f.62*v*)

caesura and to link each with the following one, so that the continuation of the melodic flow is apparent rather than the melodic structure. There is a need to investigate the extent to which this is a question of the style of performance and the extent to which the musical notation should be understood as an indication of melodic structures or as a suggestion for a method of performance. In the Old Roman tradition the care taken in recording the melody is palpably less, and the frequency of variations in the transmission of the same melody is virtually a characteristic. Another hallmark of the Old Roman tradition as opposed to the Gregorian is a different feeling of tonality. This difference is noticeable in the manner in which Gregorian psalm tones were taken over by the Old Roman tradition.



4. The relationship between the Gregorian and Old Roman melodies of the Mass. An initial general survey of the relationships between the chants of the two traditions has been made by Snow (1958). Among the introits some pieces in the two traditions show a very close relationship, while most correspond only generally. Differences of text occur more frequently in the offertories than in other classes of chant. Here the traditions differ from each other more in the melodies of the verse than in those of the refrains. A peculiarity of the Old Roman offertories is the occurrence of unusually long melismas that differ stylistically from the melismas of the alleluias. In addition, there is a manner of recitation that occurs in the offertories whereby a three-note ornamental figure is reiterated for successive syllables of text (see above, ex.1).

The number of Old Roman alleluia melodies is smaller than in the Gregorian chant repertory. Of the Old Roman alleluias, 11 have their own melodies, while the remainder utilize seven standard alleluia formulae and correspond more or less in their verses. Ten Old Roman alleluias have a ‘melodia secunda’, that is, an extension of the alleluia jubilus when it is repeated after the verse. A special study of the tracts of the 2nd mode has been made by Schmidt. The number of standard formulae is smaller in the Old Roman tradition, and in the Gregorian the formulae are not so consistently applied. On the other hand, the terminations are more strictly regularized. In the tracts of the 8th mode the divergence between the two traditions is greater. Four tracts of the 8th mode, namely the *cantica* of Holy Saturday, are almost identical in the two traditions, and here it is clear that the Old Roman tradition has adopted the Gregorian melodies.

Among the graduals (which have been investigated by Hucke) most of the Gregorian melodies are consistent adaptations of the Old Roman ones. The structure of the melodies was preserved but the melodic flow was radically transformed in a different style. Even where the Old Roman melody is palpably corrupt, the Frankish adaptation has attempted to follow the model closely. Thus it cannot be explained away as an adaptation based on a different aesthetic: rather it gives the impression of being a translation from a foreign musical language. The revised Gregorian melodies were handed down from the beginning with astonishing accuracy. The Old Roman tradition on the other hand shows traces of the subsequent formation of variants and then of later normalization. In some cases, a gradual in the Old Roman tradition has later received another melody.

Of the Old Roman communion antiphons, 30 have also come down to us as Old Roman *responsoria prolixa* for the Night Office. Until now the Gregorian variants of these communions have been only partly authenticated as responsories, while on the other hand there are communions that are authenticated as responsories in the Gregorian tradition but not in the Old Roman. Two further Old Roman communions are late adaptations of responsories. The relationship between the communion melodies of the two traditions is more varied and complicated than that of the graduals (ex.2 and ex.3). In many communions the melodic ductus of the two traditions is very similar. Often the Old Roman melody seems to be an ornamented version of its Gregorian counterpart: sometimes a specific connection between the corresponding melodies of the two traditions is detectable only at individual, isolated points in the melody, and in some cases it is uncertain whether we have before us a true connection or merely a

Ex.2 Communion *Viderunt omnes*

Ex.3 Communion *Dominus virtutum* (for Monday after Passion Sunday)

Communion *Redime me, Deus* (for Tuesday after Passion Sunday)

In Old Roman chant *Dominus virtutum* has adopted the beginning of *Redime me*

melodic similarity. The terminations of the communion antiphons are regularized differently and more rigidly in the Old Roman tradition than in Gregorian chant. The Old Roman tradition has borrowed the Gregorian antiphonal psalm tones for the psalm verses of the communion and also for those of the introit. The Old Roman melodies of the Ordinary of the Mass appear to have been taken over wholesale from Gregorian chant.

5. The relationship between the Gregorian and Old Roman melodies of the Office. The divergencies of the Old Roman repertory from the Gregorian repertory are much greater in the Office than in the Mass; and in addition, the two extant Old Roman antiphoners differ considerably. According to Snow they contain altogether 636 *responsoria prolixa*, of which a considerable proportion is transmitted in only one of the two manuscripts. Thus the extensive production of new responsories in Gregorian chant between the beginning of the 11th century and continuing through the 12th century and the 13th did not occur in the Old Roman tradition. Some Old Roman responsories have been taken over from Gregorian chant. While most of the responsory verses in Gregorian chant were sung to standard psalmodic formulae and others had their own melodies, all the Old Roman responsory verses used eight standard psalmodic formulae.

The responsories of the 2nd mode have been examined by Cutter: of 80 responsories, 51 are found in both traditions. The standard melodic formulae used in these responsories appear in both traditions with corresponding variants. The number of these formulae is, however, smaller in the Old Roman tradition; in addition, the formulae of Gregorian chant show a greater tendency to variant forms, and less standardized melodic material is used. The recitation tones of the two traditions also differ. Despite certain similarities, the melodies of the two traditions show evidence of a different stylistic character. A striking characteristic of the Old Roman responsories is the fact that the individual melodic phrases flow directly into each other: often the cadence of the first part is only completed by the opening of the second part. As a whole, the responsories of the 2nd mode in the Old Roman tradition are more uniform and consistent.

In the case of Office antiphons (according to Snow), most of the standard melodies of Gregorian chant recur in the Old Roman tradition, but only about 60% of the antiphons common to both traditions use the same melody in both. Nowacki has investigated the antiphons in greater detail. Of the antiphons contained in the tonary of Regino of Prüm, a witness of the Frankish tradition at the turn of the 9th and 10th centuries, about 56% recur in *I-Rvat* S PietroB 79: on the other hand, the 12th-century antiphoner *I-Lc* 601 contains about 69% of the Old Roman antiphons. Jammers postulated that the joint corpus in Italy was enlarged by later compositions from the 9th and 10th centuries. But only about half of the antiphons have the same melody. In the antiphons for Lent, which probably belong to the oldest corpus, the traditions deviate from each other more considerably. Cutter has drawn attention to the fact that standard antiphon melodies, used for different texts, appear in the Old Roman tradition with ever new and different variants; and that, in addition, they deviate markedly from one another in both Old Roman antiphoners. Therefore the relationship of the Office antiphons in each of the two traditions offers a different picture from that of the responsories.

Old Roman psalmody has been investigated by Hucke. In the Old Roman graduals, variants of the eight Gregorian psalm tones are used for the introit and communion; however, the system of *differentiae* is not used methodically. By contrast, the antiphonal psalmody of the chant books for the Office does not follow the system. Of the antiphons, almost 90% use one of three psalm tones – those that recite on D, C and A and correspond to the 7th, 8th, and 1st Gregorian psalm tones. Of the psalms, about 5% are sung to an equivalent of the 6th Gregorian tone, the remainder to a number of variants of the 2nd and 4th tones or to irregular formulae.

Not all of the many psalm tones and *differentiae* are evenly distributed throughout the repertory. In part they

are used for single feasts or for the octaves of feasts, but in some cases a specific succession of antiphons belonging together liturgically will consistently have the same tone and *differentiae*. Quite clearly Old Roman chant did not originally know the system of psalm tones. Between the 11th and 13th centuries, when the surviving sources of Old Roman chant were written, the Frankish system of eight psalm tones was adopted for the antiphons of the Mass (and this presupposes at the same time the regularizing of the introit and communion antiphons) and also for the responsories of the Office. The system was not at that time introduced into the Roman antiphonal psalmody of the Office.

HELMUT HUCKE/JOSEPH DYER

Old Vic. London theatre opened in 1818 as the Royal Coburg Theatre and occasionally used for musical performances. *See* LONDON, (i) §VI, 1(i).

Old Way of Singing. Term used from the 18th century for a slow, heterophonic style of unaccompanied congregational hymn singing found in rural Protestant churches in Britain and the USA. It is also variously called the 'Common Way' or the 'Usual Way', to distinguish it from 'Regular Singing'. The practice is orally transmitted. The tempo is extremely slow, lacking rhythmic drive and precision. Singers may diverge on their way from one tune note to the next, resulting in heterophony that is

sometimes perceived as conscious embellishment. In some cases a harmonic element is present.

The origins of the 'Old Way' are uncertain. Similar practices have been noted among German-speaking groups tracing their descent from the 16th-century Anabaptists (*see* AMISH AND MENNONITE MUSIC), and in several Scandinavian countries. This gives rise to the possibility that it preserves an ancient, pre-Reformation mode of popular singing that was once prevalent in northern Europe. In Britain and North America it has generally been associated with LINING OUT: the practice of reading (or later, chanting) each line of a hymn or metrical psalm by a parish clerk or precentor before it was sung by the congregation. Lining out was first discussed in the 1640s but may have existed before. Contemporary descriptions of the 'Old Way of Singing' tend to be pejorative. The earliest representation in music notation dates from 1686.

The 'Old Way of Singing' was quickly suppressed when organs, rehearsed choirs, or band instruments were introduced into worship, as they were in most denominations during the 18th century. It had probably disappeared from Anglican churches by about 1770. The practice survived longest in remote areas where such facilities were not available, and in theologically conservative sects that still maintained the Puritan ban on all aids to singing in worship. It can be heard today in Free Presbyterian churches in the Western Isles of Scotland and in Primitive and Regular Baptist churches in southern Appalachia.

NICHOLAS TEMPERLEY

Olearczyk, Edward (*b* Rawa Ruska [now Rava-Russkaya], 4 March 1915). Polish composer and conductor. He studied the piano with Zbigniew Drzewiecki at the Warsaw Conservatory (1934–8) and lived in the former Soviet Union from 1939 to 1945. After the war he returned to Poland and became musical director of the Polish Army Ensemble.

Olearczyk was one of several composers (together with Gradstein, Lutosławski and Witold Rudziński) who were the principal contributors to the genre of mass song during the period of socialist realism (1947–55). His style ranged from the portentous hymn (usually reserved for political topics) to the jaunty march. The most famous example of the latter is *Miliony rąk* (1950), a vision of the future in which millions of hands work to a single beating heart. Olearczyk's songs also demonstrate a lighter touch, as in the waltz *Na strażnicy* ('On the Watch-Tower', 1952), a love letter from a border guard to his girl back home. The greatest influence of popular light music is felt in *M.D.M.* (1952), an evocation of the massive Stalinist residential and commercial showpiece being built at the time in central Warsaw. Its perky rhythms and melody undoubtedly matched the capital's aspirations for a new life; but they are curiously out of kilter with the scale of the project, which is second only to the contemporaneous Palace of Culture and Science in its grandiosity.

ADRIAN THOMAS

O'Leary [née Strong], **Jane** (*b* Hartford, CT, 13 Oct 1946). Irish composer of American birth. She studied at Vassar College (BA 1968) and at Princeton University (MA 1971, PhD 1978), where her composition teachers included Babbitt and Randall. She taught at Swarthmore College (1971–2) and, after moving to Ireland with her Irish husband, at the DIT College of Music, Dublin (1974–7), and University College, Galway (1978–83). In 1976 she founded the contemporary music ensemble Concorde, with whom, as both pianist and artistic director, she has given many first performances of new Irish works. She has spoken and had her music performed at international congresses of women composers, and from 1986 to 1994 served on the executive committee of the International League of Women Composers.

In addition to her work as a composer and performer, O'Leary has been active in the administration and organisation of music in Ireland. She was a founder of Music for Galway in 1981 (chair 1984–92), and has served as a member of the board of directors of the Contemporary Music Centre, Dublin (1989–97), the Cultural Relations Committee at the Irish Department of Foreign Affairs and the Irish Arts Council. Her honours include membership in Aosdána (from 1981), a special commendation from Vienna Modern Masters (1992) for her orchestral work *Islands of Discovery* (1991) and the Marten Toonder Award for composition (1994).

Most of O'Leary's compositions written before 1983 employ dodecaphonic or serial techniques. Many of these are short movements for chamber ensemble, such as the Quartet for clarinet, bass clarinet, violin and violoncello (1969); a few are solo piano or vocal works. With her membership in Aosdána came a change in musical style. Turning away from strict 12-note procedures of a fragmentary character, she embraced long, fluid melodic lines and rich harmonic textures. Modal harmonies and folksong-like melodies show the influence of her adopted homeland. Poetry, especially of the Irish poet Brendan Kennelly, and the landscape of the Irish west coast have served as extra-musical inspirations.

AXEL KLEIN

Olefsky, Paul (*b* Chicago, 4 Jan 1926). American cellist. He studied at the Curtis Institute with Daniel Saidenberg and Piatigorsky; later he worked with Casals and studied conducting with Karajan and Monteux. He was a member of several American orchestras, including the Philadelphia Orchestra and the Detroit SO, and appeared as a recitalist in North America and Europe in repertory ranging from the Bach suites to Kodály's unaccompanied Cello Sonata. He gave the premières of works by Kurt George Rogers, Virgil Thomson, Milhaud, Shapleigh and Alexander Tcherepnin, among others. In 1974 he was appointed professor of cello and chamber music at the University of Texas, Austin. Olefsky's playing was noted for its energy and sensitivity. His recordings include the complete sonatas of Beethoven and Brahms.

MARGARET DOUTT

Olenina d'Alheim [d'Al'geym; née Olenina], **Mariya Alekseyevna** (*b* Istomino, Ryazan province, 20 Sept/1 Oct 1869; *d* Moscow, 27 Aug 1970). Russian mezzo-soprano. Although she had lessons in 1887 with Yuliya Platonova and Aleksandra Molas, and later studied in Paris, she was never systematically trained. She made her début in Paris in 1896, singing music by Musorgsky, and in Russia (St Petersburg) in 1901. From then on she led a busy concert life in St Petersburg and Moscow. She and her husband, Pierre d'Alheim (1862–1922), a French writer, author of a book on Musorgsky and translator into French of his texts, were energetic advocates of Russian music in the West. In 1908 she founded in Moscow a so-called 'Maison du Lied' with the aim of spreading classical and contemporary vocal chamber music. The Maison, which existed until 1915, organized concerts, international competitions for song arrangements and for Russian translations of texts, and published a bulletin. In 1910 Olenina d'Alheim gave recitals in London, and in 1918 she moved to Paris. She last sang in Moscow and Leningrad in 1926 and returned to live in Moscow in 1959.

An outstanding recitalist, Olenina d'Alheim belonged, according to Stasov, to a group of artists with peculiarly Russian characteristics. Although her voice was neither particularly powerful nor particularly beautiful, she exerted a strong artistic influence. Her lofty inspiration and her grasp of the style and essence of a song made her performances totally compelling; her enunciation and declamation were beyond reproach, her phrasing noted for its expressiveness. In works such as Musorgsky's 'The Field-Marshal' (*Songs and Dances of Death*) and *Nursery* cycle, or Schubert's *Der Erlkönig*, she reached heights of tragic pathos. Her repertory included music by trouvères and Minnesinger, French and Italian Renaissance composers, Russian and west European classical and contemporary composers (often rare or new works), and folksongs. She published *Le legs de Moussorgski* (Paris, 1908) and the last interview with her, 'Tsel' moyey zhizni bïla znakomit' lyudey s russkoy muzïkoy' ('My life's aim was to acquaint people with Russian music'), was printed in *Literaturnaya rossiya* (12 September 1969).

I.M. YAMPOL'SKY

Oley, Johann Christoph (*b* Bernburg, bap. 3 June 1738; *d* Aschersleben, 20 Jan 1789). German organist and composer. There is some evidence that he studied with Bach for a short time in 1749, but none connecting him with the Thomasschule. In 1755 he became organist of the church in Bernburg, but moved to the church of St Stephan in neighbouring Aschersleben in January 1762 because of its superior organ. To augment his salary he assumed the duties of assistant schoolmaster as well. Contemporaries praised Oley's skill on the keyboard and organ, and his compositions attracted some interest. His organ writing reminded J.F. Agricola, another Bach pupil, of the glories of an earlier age. J. Beckmann, in a review of 1778, criticized carelessness in his harmony, giving credence perhaps to Gerber's statement that in the main Oley was self-taught. Bach's personal influence was probably insignificant: Emery has suggested that certain details in the copies of Bach's music that Oley made on his return to Bernburg, and later, reveal an unfamiliarity with his practice. Sietz mentioned some manuscript works by Oley in a private collection in Dessau, but only a set of 14 keyboard variations (published in Nuremberg, n.d.) and the four-volume *Variirte Choräle* (Quedlinburg, 1773–92) seem to be extant. The latter work contains 77 settings for organ solo (10 ed. W. Emery, London, 1958 and 1964; others ed. W. Syré, Locarno, 1987), two for solo oboe and organ, and six for organ and instrumental ensemble of flute, oboe, bassoon, horn, two violins, viola and cello (2 ed. F. Haselböck, Stuttgart, 1976). The most interesting combine his fondness for strict canon with passages in the more expressive style. Oley owned one of the four extant copies of the Schübler chorales (in *A-Wn*, with Bach's corrections), but in spite of speculation to the contrary he probably did not have access to Bach's estate.

Oliac y Serra, Juan (*b* ?Barcelona, *c*1708; *d* Avila, 20 Jan 1780). Spanish composer. From an early age he showed exceptional talent as a conductor and composer and studied music with his uncle, Luis Serra, *maestro de capilla* of Pilar Cathedral, Zaragoza. At the age of 18 he was the winner of the competitions for *maestro de capilla* of the Salvador church in Zaragoza. In 1734 he was appointed to a similar position at Avila Cathedral, where he served until his death and where most of his compositions are preserved. Other works are in Santiago Cathedral and other Spanish archives.

JOSÉ LÓPEZ-CALO

Oliphant (from Old Fr. *olifant*: 'elephant', properly *cor d'olifant*). Medieval end-blown ivory horn, sometimes finely carved, perhaps more often used as a token of land tenure or rights, and by churches as a reliquary, than as a musical instrument. Oliphants were made from the 10th century and particularly in the 11th, largely by Muslim craftsmen in south Italy and Sicily. There is no proof that Charlemagne or his knights possessed an oliphant and sounded it in battle, despite a mention in the *Chanson de Roland*, though among the surviving examples at least three are said to be the one Roland blew at Roncevaux. Unlike earlier specimens the 11th-century oliphants were left smooth in two places to accommodate metal bands which took a slinging chain. Some 60 of this type are known, including the 'horn of Ulf' in York Minster (see illustration). Ivory horns, usually highly decorated, continued to be made, especially in Benin (such instruments are known as 'Afro-Portuguese'), from the Renaissance to the 18th century; these horns were given as princely gifts from one potentate to another.

ANTHONY C. BAINES/JEREMY MONTAGU

Oliphant, Thomas (*b* Condie, Perthshire, 25 Dec 1799; *d* London, 9 March 1873). Scottish musical author, editor and cataloguer. Educated privately and at Winchester, he entered the Stock Exchange, but abandoned commerce to follow a musical career. For over 40 years he was an active member of the Madrigal Society, of which he became honorary secretary in 1832. He seems to have held that office until 1871, when he was made a vice-president; he was elected president in 1872. His study of madrigals induced him to publish some 50 English and Italian works in popular editions and several cognate books. Many first and early editions of madrigals were in Oliphant's private music library, which was auctioned by Puttick & Simpson in 1873.

From November 1841 to July 1850 Oliphant was employed as a temporary assistant in the British Museum. Vigorous protests had previously been made to the trustees for allowing the music in their collections to accumulate uncatalogued. Oliphant's appointment was strongly criticized (notably in the *Musical World*) but, whether or not due to his membership of the influential Madrigal Society, it was of incalculable benefit to the museum. Oliphant not only cleared off the arrears but also laid the foundation for future expansion. Within a year he completed a catalogue of the MS music; he then turned his attention to the far greater quantity of printed works. Most of them had been received by deposit under the Copyright Acts, but there was also important earlier music acquired by purchase, a policy which was then in its infancy, but which Oliphant did much to develop. Ultimately he wrote over 24,000 catalogue entries, and then, with the support of Antonio Panizzi, the redoubtable Keeper of Printed Books (who had drawn up the rules for cataloguing music early in 1840), arranged the slips in 45 folio volumes for the use of readers. Such was the foundation of the catalogue of printed music, which has now expanded into the 62-volume *Catalogue of Printed*

Oliphant known as the 'horn of Ulf', 11th century (York Minster)

Music in the British Library to 1980 (1981–7) and its successor, the Current Music Catalogue database.

Oliphant's instinctive grasp of the principles of sound cataloguing was all the more remarkable since he worked at a time when professional training for librarianship was quite unknown. Early in 1850 he put forward a well-thought-out memorandum for the development of music in the collections. Panizzi, whose attitude to music was ambiguous and who certainly found Oliphant difficult, laid the memorandum before the trustees, but did not recommend its adoption. Oliphant resigned.

ALEC HYATT KING/R

Oliva (*fl* Ripoll, 1037–65). Catalan theorist, poet and mathematician. He wrote a *Breviarium de musica* (ed. in Anglès, 1976) at the request of a fellow Benedictine monk who asked for an explanation of the correct mathematical division of the monochord. It is dedicated to the abbot of Ripoll, also named Oliva, and is the earliest music treatise by a Catalan. The subject matter includes the three genera (diatonic, chromatic and enharmonic) and the eight tones or tropes. The autograph manuscript (in *E-Bac*) continues with parts of the *De institutione musica* of Boethius, the 9th-century *Musica enchiriadis* and its associated texts, and Hucbald's *De harmonica institutione*.

ROBERT STEVENSON

Olivares, Juan Manuel (*b* 12 April 1760; *d* 1 March 1797). Venezuelan composer, violinist, organist, pianist, educator and church musician. On 11 May 1789 he married Sebastiana Velásquez, sister of the composer José Francisco Velásquez. He composed mainly for Caracas Cathedral, in 1791 receiving 184 pesos for a collection of his sacred music; he was also employed by church confraternities. In October 1793, 1794 and 1796 he was in charge of the choral music for Caracas's feast of Naval; in 1797 his son Juan Bautista held this post.

SHARON E. GIRARD

Oliveira, Fernando Correia de (*b* Oporto, 2 Nov 1921). Portuguese composer and theorist. He studied at the Oporto Conservatory with Cláudio Carneiro (composition) and Maria Adelaide Freitas Gonçalves (piano). In 1948 he studied in Venice with Hermann Scherchen. In the same year he formulated the principles of a composition system called 'sound symmetry' which includes 'symmetrical harmony' and 'symmetrical counterpoint'. This system, where chords are constructed from equal intervals above and below a central pitch, is the basis for his compositions. He also created a method of music teaching. He founded the Parnaso Academy for music, dance and theatre in Oporto.

JOSÉ CARLOS PICOTO/ADRIANA LATINO

Oliveira, Jamary (*b* Saúde, Bahia, 21 March 1944). Brazilian composer and teacher. He studied the flute, the viola and the tuba, and theory and composition with Ernst Widmer at the Federal University of Bahia, taking a composition diploma in 1969. In the USA he studied composition with Shapero, Shifrin and Arthur Berger at Brandeis University (MFA 1979), and with Korte, Grantham and Pinkston at the University of Texas at Austin (DMA 1986). He is a founder-member of the Grupo de Compositores da Bahia (1966). Returning to the university in Bahia, he became an assistant instructor (1966–77), then an adjunct professor from 1983 until his retirement in 1994, after which he continued as the coordinator of graduate studies in music and a graduate instructor in theory, composition and computer applications in music. Throughout the 1970s and 80s Oliveira was active in national music organizations, serving as president of ANPPOM (National Association of Research and Graduate Study in Music) and as a founding member of the Sociedade Brasileira de Música Contemporânea, among others. He became a life member of the Academia Brasileira de Música (1994), and has received several fellowships and prizes.

Oliveira has purposely avoided subscribing to any compositional dogma. He began by adhering to some aspects of musical nationalism in a highly dissonant style, then cultivated an unorthodox 12-note technique incorporating aleatory and other methods. His output, numbering 39 works over the period 1963–96, reveals a skilful, serious and highly concentrated creative individual. His research into computer applications in music theory and composition won him the post of senior researcher at the National Council for Scientific and Technological Development. As well as *Informática em música: o parâmetro altura* (Salvador, 1995), he has written many articles on subjects ranging from Stravinsky to computer music in publications and journals including the *Latin American Music Review*.

GERARD BÉHAGUE

Oliveira, João Pedro (Paiva) (*b* Lisbon, 27 Dec 1959). Portuguese composer, organist and teacher. He studied at the Instituto Gregoriano in Lisbon (organ with Antoine Sibertin-Blanc and composition with Christopher Bochmann). He also frequented the seminars given by Emanuel Nunes at the Gulbenkian Foundation. He continued his studies in the USA at Brooklyn College with Charles Dodge and at Stony Brook University, where he studied electronic music with Arel and Semegen (PhD, 1990). He was appointed to teach at the music department of the University of Aveiro.

He has a richly mystical vision of the process of composition, in which the composer transcends his own ego in an attempt to capture and develop fleeting impressions that pass by him. Stylistically, his music owes much to his American training, with a clearly atonal language. There is a strongly logical rhetoric, sustained through constant transformation and variation, from which moments of religious ecstasy emerge. His works are often arranged in large cycles.

CHRISTOPHER BOCHMANN

Oliveira, Jocy de (*b* Curitiba, Brazil, 11 April 1936). Brazilian composer, pianist and multimedia artist. The most prominent woman composer in Brazil, she began her piano studies in São Paulo under José Kliass (1946–53) and continued them in Paris under Marguerite Long (1953–60). In 1963 she moved to St Louis, Missouri, with her husband, the conductor Eleazar de Carvalho, and studied composition with Robert Wykes at Washington University, earning her MA in 1968. She taught at the University of South Florida and at the New School for Social Research in New York.

As both a pianist and a composer, Oliveira has promoted contemporary music in Brazil on various fronts. Numerous major composers such as Berio, Xenakis, Lejaren Hiller and Santoro have written pieces for her. She played Stravinsky's *Capriccio* under the baton of the composer and was soloist with major orchestras such as the Boston SO, the Brooklyn PO, the Los Angeles PO, the Orchestre de la Radio-France, and many others in Europe and Latin America. She has recorded about 16 discs, released in the USA, Brazil, Mexico, Britain and Germany, performing all the major piano works of Messiaen, her own compositions and other contemporary works.

Her compositions include five major operas and music theatre works which have been acclaimed through several productions in different countries. In 1993 she began an opera trilogy with *Inori, à Prostituta Sagrada*, presented during an entire month at the Bank of Brazil Cultural Centre in Rio de Janeiro. The second opera, *Illud tempus*

(1994), selected by the newspaper *O Globo* as one of the ten best musical events of the year, was produced with great success in Rio and São Paulo as well as at the Haus der Kulturen der Welt, Berlin (1995). Her magic opera *Fata Morgana* (1987) was first performed at the Museum of Modern Art in Rio. Of her multimedia works, *Space Liturgy* (1988) was presented before an open-air audience of 15,000 in Rio, and the planetarium piece *Música no espaço* was performed in the 1980s at the Hayden Planetarium in New York and other planetariums in Miami, Rio and São Paulo. The variety of media used since the 1960s emerged from her conviction that sound expression is universal in all life.

GERARD BÉHAGUE

Oliveira, Manoel Dias de (*b* São José del Rei [now Tiradentes], *c*1735; *d* São José del Rei, 19 Aug 1813). Brazilian composer, organist and conductor. He was active in the province of Minas Gerais during the late colonial period and worked as a scribe in several brotherhoods in São José del Rei and São João del Rei. In the register of death certificates and wills at the church of S Antônio in his native city he is described as 'mestre compositor de muzica'. According to research by J.M. Neves, Oliveira was also a captain and a mulatto. His rather extensive output includes a Mass, Te Deum, *Magnificat*, novenas, litanies and motets. The works are preserved chiefly in the archives of the Lira Sanjoanense Orchestra and the Lira Ceciliana, though few of the manuscripts are autograph. Several of his pieces were recorded in the 1980s. (J.M. Neves: *Música sacra mineira: catálogo de obras*, Rio de Janeiro, 1997)

GERARD BÉHAGUE

Oliveira, Willy Corrêa de (*b* Recife, 11 Feb 1938). Brazilian composer. After early studies in music with local private teachers he studied theory and composition with Olivier Toni in São Paulo until 1961. He taught at the Lavignac Conservatory in Santos (1962) and worked as music director and composer for Jotafilmes (until 1964) and two other publicity agencies. Under a scholarship from the Brazilian and German governments he spent several months in Europe in 1962, attending the Darmstadt summer courses and studying with Henze, Stockhausen and Boulez. Subsequent sojourns in Europe allowed him to study with Pousseur, Berio and others. He taught information theory and poetics at the Escola Superior de Propaganda in São Paulo (1969) and then composition at the University of São Paulo. From the mid-1960s he participated in the annual New Music Festival (at Santos, and later in São Paulo), where several of his works were first performed. In 1973 he undertook research in Buenos Aires on the work of Shreker, then gave lectures in Rio de Janeiro on modern compositional techniques. A year later he gave an introductory course on contemporary musical thought within the First International Music Biennial of the University of São Paulo. His first compositions (1955–9) are based on features of north-east Brazilian folk music. After about 1961 he began working with 12-note and 'total serial' techniques, later developing an interest in aleatory procedures but maintaining a tight control of all parameters. In the late 1970s he suffered an existential crisis, questioning the meaning and aims of art-music composition, especially the music of the 'bourgeois avant garde'. He wrote very little and dedicated himself more to theory and teaching. Since the early 1980s he has been writing music for commercial films, documentaries and plays, and piano pieces of a deliberate simplicity.

GERARD BÉHAGUE

Oliver [Olyver] (*fl c*1410). English composer. His four surviving compositions are in the old layer of the Old Hall Manuscript, although internal evidence suggests that they arrived after much of the other music had been copied. Although they are all in score, they have more in common stylistically with the second-layer music than with the first-layer descant settings.

MARGARET BENT

Oliver (Pina), Angel (*b* Moyuela, Zaragoza, 2 Jan 1937). Spanish composer and organist. While training as a teacher in Madrid, he studied music at the Real Conservatorio Superior de Música (Jesús Guridi organ prize, 1964; first prize in composition, 1965), where his teachers included Victorino Echevarría, Calés, Cristóbal Halffter and Guridi; he later studied in Rome (Spanish Rome Prize, 1965) with Petrassi and Porena, and at Darmstadt (stipend 1973, 1975) with Stockhausen, Ligeti and Aloys Kontarsky. From 1956 to 1966 he was organist at the church of the Ciudad Universitaria of Madrid, and from 1964 he directed the choir of the Colegio Alemán. He was appointed to a post at the Madrid Conservatory in 1965. His many honours include the Arpa de Plata prize (1974), the Cristóbal Halffter prize for organ composition (1980) and the Queen Sofía prize (1987). His long-term commitment to music education is reflected in his numerous writings.

Oliver's extensive catalogue betrays his particular fondness for chamber and vocal music; church music also occupies an important position in his oeuvre. His compositional style, which is based on serial techniques and a thorough grasp of musical theory, has been described as 'moderate Modernism' (Cabañas Alamán, 1991). He has avoided sensationalism and experimental pursuits in favour of carefully crafted statements in a calculated musical language, as exemplified by his attention to timbre in *Nunc* (1979–86) for divided string orchestra. Isolated from the dominant aesthetics of the Spanish avant garde, his music is not well known outside of Spain.

CHRISTIANE HEINE

Oliver, King [Joe] (*b* ?New Orleans, 11 May 1885; *d* Savannah, GA, 8/10 April 1938). American jazz cornettist and bandleader. He is said to have begun to study music as a trombonist, and from about 1907 he played in brass bands, dance bands and various small black American groups in New Orleans bars and cabarets. In 1918 he moved to Chicago (at which time he may have acquired his nickname), and in 1920 he began to lead his own band. After taking it to California in 1921, he returned to Chicago and started an engagement at Lincoln Gardens as King Oliver's Creole Jazz Band (June 1922). This group was joined a month later by the 22-year-old Louis Armstrong as second cornettist. Oliver began recording in April 1923. Many young white jazz musicians had the opportunity to hear him then, either on recordings or live at Lincoln Gardens.

In February 1925 Oliver's reorganized band began a two-year engagement at the Plantation Cafe in Chicago, as the Dixie Syncopators. The group disbanded soon after a brief but successful engagement (from May 1927) at the Savoy Ballroom in New York, where Oliver remained. From 1930 to 1936 he toured widely, chiefly in the Midwest and upper South, with various ten- to 12-piece bands; he himself seldom performed during this period and he made no further recordings after April 1931. He spent the final months of his life retired from music in Savannah.

Like other early New Orleans cornettists, Oliver played in a clipped melodic style with relatively four-square rhythm (contrasting with the deliberate irregularity of the younger Armstrong and his imitators) and had a repertory of expressive deviations of rhythm and pitch, some verging on theatrical novelty effects and others derived from blues vocal style. He frequently used timbre modifiers of various sorts, and was especially renowned for his wa-wa effects, as in his famous three-chorus solo on *Dipper Mouth Blues* (1923, Gen.), which was learnt by rote by many trumpeters of the 1920s and 30s and which, as *Sugar Foot Stomp*, became a jazz standard. As a soloist he may best be heard in a number of blues accompaniments, notably with Sippie Wallace.

In contrast to his near-contemporaries Freddie Keppard and Bunk Johnson, Oliver integrated his playing superbly with his ensemble, and was an excellent leader; the Creole Jazz Band may have been successful largely because of the discipline he imposed on his musicians. Indeed, of the earlier New Orleans cornettists, only Oliver was extensively recorded in the 1920s with an outstanding ensemble, and the revival of New Orleans style, which began shortly after his death, owed much to the rediscovery of his early three dozen Creole Band recordings, which were internationally known by the 1940s. Among the best of these are *Chimes Blues* (1923, Gen.) and *Snake Rag* (1923, OK). After 1924 the quality of his recordings declined, partly because of recurrent tooth and gum ailments and partly because his style was at odds with that of his younger sidemen; but with a good band he was capable of coherent and energetic playing even as late as 1930. Almost all of his recorded performances have been reissued.

LAWRENCE GUSHEE

Oliver, Paul (Hereford) (*b* Nottingham, 25 May 1927). English writer on jazz and blues. He wrote articles and reviews for *Jazz Journal* (1952–*c*1960), *Music Mirror* (1954–9) and *Jazz Monthly* (1956–70), columns for *Jazz Beat* (in the 1960s) and *Hi-fi News and Record Review* (from the 1960s to 1980), and many disc notes. He became particularly well known for his writings on early jazz and the blues; he also gave broadcasts for the BBC from 1954. Oliver successfully brought the techniques of ethnomusicology to the study of blues; he made field visits to Africa and the American South, and challenged many of the assumptions of such earlier writers on jazz as Rudi Blesh by finding a stronger kinship with the blues and early jazz in the music of the savannas than in that of West Africa. He has also conducted important research into the influence of the songster and sermon traditions on race records. In addition to his work as a writer he has given lectures on jazz at the University of Cambridge, and his drawings of jazz and blues musicians have appeared in *Jazz Journal* and *Radio Times*. He is also well known as an architectural historian and critic.

ROBERT GANNON

Oliver, Stephen (*b* Chester, 10 March 1950; *d* London, 29 April 1992). English composer. He studied with Kenneth Leighton and Robert Sherlaw Johnson at Oxford, where student productions of his first operas, notably *The Duchess of Malfi* (1971, later completely rewritten), soon brought him to wide attention. By the age of 24 he was able to subsist as a freelance composer, working mainly in the field of opera. Partly on the basis of *Malfi*'s success, Oliver was commissioned by Colin Graham to write *Tom Jones* (1975) for his English Music Theatre Company, while his last major work was a full-length opera for ENO, *Timon of Athens* (1991). But the bulk of his operatic output consists of smaller-scale and more individual dramatic structures, ranging from brief monologues and 'mini-operas' (his own term) to works with young or amateur performers in mind, such as *Three Instant Operas* (1973), *The Dong with the Luminous Nose* (1976) and the children's operetta *Jacko's Play* (1979). He also wrote a musical, *Blondel* (to lyrics by Tim Rice), and incidental music for a number of stage and television productions. Oliver was much associated with the Musica nel Chiostro festival at Batignano, Italy, where a number of his stage works received their first performances and for which his last work, an adaptation of Mozart's *L'oca del Cairo*, was written. By comparison with his operas, Oliver's instrumental music is less substantial, but includes a Symphony (1976, rev. 1983), a Recorder Concerto for Michala Petri (1988), five *Ricercare* for various chamber forces (1973–86) and secular and liturgical choral works; he also translated opera libretti into English performing versions, notably Sallinen's *The King Goes Forth to France* and *The Red Line*. Stylistically, Oliver's music is wide-ranging. He was as deft at pastiche in his music for the non-operatic stage and television as he was confident in the more personal musical language of his instrumental works and larger operas, where colour and gesture prevail; but his greatest legacy, perhaps, is the fluency with which he wrote for the human voice, where, as with his often straightforward harmonic language, communication is the key.

MATTHEW RYE

Olivero, Betty (*b* Tel-Aviv, 16 May 1954). Israeli composer, active in Italy. She studied at the Rubin Academy of Music, Tel-Aviv University (BMus 1978) with Sadai and Leon Schidlowsky, and at Yale University (MA 1981), where her teachers included Druckman, Amy and others. In 1982 a Leonard Bernstein Scholarship enabled her to work at Tanglewood with Berio, whom she continued to study with in Italy (1983–6). While most of her music relates to Jewish musical traditions, her compositional style shows the influence of early Penderecki, as well as Berio. Throughout her career she has drawn upon traditional Jewish folksongs, and Sephardi and Middle Eastern Jewish folklore; in the mid-1990s she turned to Ashkenazi klezmer music as another source of inspiration. Folk material appears in her music in rich, nuanced arrangements, or is transformed through avant-garde techniques into contexts featuring dense heterophony and tone clusters. The pitch content, orchestration and rhythmic complexity of her works contribute to a coherent, non-eclectic style that nonetheless combines such diverse elements as Judeo-Spanish music, Arab tunes, klezmer melodies and European avant-garde techniques. Her compositions have been performed by leading orchestras, including the Chicago SO, the New York PO, the BBC SO, the London Sinfonietta and the Israel PO, and at major European festivals.

RONIT SETER

Olivero, Magda [Maria Maddalena] (*b* Saluzzo, nr Turin, 25 March 1910). Italian soprano. She studied in Turin and made her début there in 1933 as Lauretta in *Gianni Schicchi*. Her early roles included Manon Lescaut, Mimì, Elsa, Liù, Violetta (Reggio nell' Emilia and Parma) and Butterfly (Modena and Naples). During the 1939–40 season she sang Adriana Lecouvreur in Rome, Naples, Venice and Florence, becoming Cilea's preferred interpreter of the role. She added the title roles in *Francesca da Rimini* and *Suor Angelica* and Zandonai's Giulietta to her repertory. In 1941 she married and retired, but at Cilea's urging she made her reappearance in 1951 as Adriana Lecouvreur at Brescia.

During the next 20 years Olivero became specially identified with Fedora, Tosca, Minnie and Mascagni's Iris. She made her London début in 1952 at the Stoll Theatre as Mimì and in 1963 sang Adriana Lecouvreur at the Edinburgh Festival. She sang in the USA at Dallas in 1967 as Medea, in New York in 1970 in *La voix humaine* and at the Metropolitan in 1975, when she was over 60, as Tosca. Her singular dramatic gifts and her finely articulated, sincere singing are captured on a film of her Tosca. She also made highly individual and compelling recordings of her Adriana, Liù and Fedora.

HAROLD ROSENTHAL/ALAN BLYTH

Oliveros, Pauline (*b* Houston, 30 May 1932). American composer. She studied at the University of Houston (1949–52) and San Francisco State College (BA 1957); she also took private lessons with Robert Erickson. A founding co-director of the San Francisco Tape Music Center (1961–5) with Subotnick and Ramon Sender, she taught, from 1967, at the University of California, San Diego. In 1981 she resigned her post to become a freelance composer and in 1985 she became director of the Pauline Oliveros Foundation in Kingston, New York. Among the rewards she has received are the Guggenheim Fellowship for Composition (1973) and the NEA Composer's Fellowship (1990). She has also served as composer-in-residence at Northwestern University (1996) and Mills College, Oakland, California (1999).

Oliveros's earliest music was conventionally notated, in an abstract but idiosyncratic style. Following these notated compositions, she explored tape and electronic music techniques. The major and enduring shift in her work came in the mid-1970s when her studies of native American cultures and Eastern religions led to a kind of meditative improvisation as a way of teaching people to recognize their own musicality. Her compositions began to introduce meditation practices within larger ritualistic or ceremonial forms, as well as to explore concepts such

Pauline Oliveros

as the self as a non-autonomous entity and to value as qualities such as intuition commonly thought to be feminine. These diverse elements can be seen in *Crow Two* (1974), a text score in which the performers are asked to communicate telepathically with the audience, members of which are invited to participate on stage. Subsequently Oliveros has occasionally returned to notation, the rigour of which is combined with the freedom of improvisation. Examples of this include *Tree/Peace*, though even in such works no system appears to underlie the composition process.

Many of Oliveros's musical, social, and feminist concerns coalesce in *Njinga the Queen King* (1993), a music-theatre work to words by Ione. The piece centres on Njinga, the 17th-century regent of Ndongo (now Angola), who passed as a man and managed to keep marauders and slave-traffickers at bay through her skills as a warrior and diplomat. In this and other works, Oliveros has cultivated a music-making and perception which she calls 'deep listening', still rooted in the practices of improvisation and meditation, and with the aim of self-realization. Oliveros has also become interested in exploring the sonic properties of spaces employing acoustic instruments and digital delays.

TIMOTHY D. TAYLOR

Oliver y Astorga, Juan (*b* Yecla, Murcia, 1733 or 1734; *d* Madrid, 12 Feb 1830). Spanish violinist and composer. He is probably the Oliver, mentioned by Eitner, who gave a concert in Frankfurt am Main on 18 April 1765 and appeared in London in 1767 as a virtuoso violinist. Under the name of Jean Oliver Astorga he published in London *Six sonates à violon et basse* op.1 (?1767, ed. L. Siemens Hernández, Madrid, 1991), *Twelve Italian Songs and Duets for Voice and Harpsichord with Accompagnement for a Guittar* op.2 (1768) and *Six Sonatas for Two German Flutes or Two Violins and a Bass* op.3 (?1769). Both sets of sonatas were dedicated to his patron, Willoughby Bertie, 4th Earl of Abingdon. He later returned to Spain, where he continued to compose, and on 30 March 1776 was appointed violinist to the royal chapel of Madrid. In 1789 he was appointed conductor of the Teatro de los Caños del Peral in Madrid, the theatre of the Italian Opera company, but Charles IV prevented him from taking up this post, wishing him to remain exclusively in his own service in the royal chapel. After about 1790 he was also a member of the King of Spain's chamber music, and he worked industriously for Charles IV, particularly on the occasion of the Prince of Parma's visit in 1807.

Oliver y Astorga's instrumental music is in the *galant* style typical of the period. The violin sonatas require considerable technical proficiency for performing double stops and other idiomatic devices but rarely go beyond 3rd position. Six sonatas for violin and cello and five for viola and cello are in Madrid (*E-Mp*). Eitner also attributed three cantatas to him (*B-Bc*).

GUY BOURLIGUEUX

Olivier. Composer, possibly identifiable with MEIGRET.

Olivier, Jo(hannes) (*fl* late 14th century). French composer. Olivier may be the Johannes Olivier mentioned as a clerk of the diocese of Cambrai in a list of petitions to Pope Clement VII in 1378. His only extant work is the three-voice ballade *Si con cy gist mon cuer* (in *F-CH* 564; ed. in PMFC, xviii, 1981; CMM, liii, 1970, and in Koehler), which has complex syncopations in both cantus and contratenor; and the proportional relationships between voices, referred to in the text, give rise to 4 beats against 3, and 9 against 6 vertically.

GILBERT REANEY

Olivieri [de Massini], **Angelo** (*fl* Rome, 1679–1702). Italian composer. He composed an oratorio, *Innocentia in Joseph exaltata*, for the Arciconfraternità del SS Crocefisso, sung at the church of S Marcello during Lent 1679, and a cantata, *La terra tributaria con le quattre stagioni al presepe di Nostro Signore* (libretto by Gaetano Monaci), performed at the Vatican on Christmas Eve 1680; the music of both these works is lost. Some of the nine secular cantatas by him in the Barberini collection (*I-Rvat*) are dated between 1680 and 1682. In January 1681 he set to music a comedy, *Dalla padella alla bragia*, by D.F. Contini for the wedding of Costanza Barberini and G.F. Caetani, Duke of San Marco (score in *I-Rvat*); it was performed in Palestrina and repeated shortly afterwards at the Collegio Clementino, Rome, for Queen Christina of Sweden. In 1684 Olivieri was commissioned by the Congregazione dei Musici di S Cecilia to compose a *Te Deum* to celebrate new papal constitutions, and in 1702 he was asked to write a requiem to commemorate King James II of England in S Lorenzo in Lucina. A four-voice motet, *Confitebor tibi*, is also extant (in *I-Rvat*, C.G.). Works such as the cantata *Pensieri d'amore*, for two sopranos, bass and continuo, show Olivieri's music to be charming and lively, and similar in style to that of the young Alessandro Scarlatti.

Olivieri was possibly related to two other musicians active in Rome in the late 18th century: Onofrio Olivieri, a bass singer, and the composer and organist Paolo Olivieri.

JEAN LIONNET

Olivieri, Giuseppe (*d* ?Rome, ?1623). Italian composer and poet. He described the contents of his 1617 volume as 'youthful' products, and according to his 1620 volume he had been in the service of the Duke of Altaemps. He was *maestro di cappella* of S Giovanni in Laterano, Rome, in 1622, but his name had disappeared from the records by 1623. He seems to have composed some sacred music, but his only surviving pieces are the secular *La turca armoniosa*, for two and three voices and continuo (Rome 1617), and *La pastorella Armilla variamente cantata*, for

one to three voices and continuo (Rome, 1620). The 16 duets and five trios in the earlier volume show a fusion of the traditional polyphonic madrigal with the melodic features of the new monodic style; they include dialogue-like writing. (E. Schmitz: 'Zur Geschichte des italienischen Continuo-Madrigals im 17. Jahrhundert', *SIMG*, xi, 1909–10, pp.509–43, esp. 515)

NIGEL FORTUNE

Olivieri, Paolo (*b* ?Rome; *d* Rome, ?20/21 Sept 1683). Italian composer and organist. Nothing is known of his youth, but by 7 July 1660, when he accepted the boy castrato Francesco Picchino as a pupil, he was already *maestro di cappella* of the basilica of S Marco, Rome. Between 1667 and 1673 he regularly played the organ for the festivities on 25 August at S Luigi dei Francesi there. His wife was Orsola Foggia, daughter of Francesco Foggia. As a member of the Accademia di S Cecilia, Oliveri was given responsibility for important musical events, for example vespers on the feast day of the patron saint in 1669, and music for the monthly litanies in July 1678. From 1676 to 1683 he was an extra organist at S Giacomo degli Spagnoli. In July 1683 he received assistance from the Accademia di S Cecilia on account of an illness. A requiem mass was said for him on 22 September of that year in the church of the Maddalena, so he must have died some days previously. He was probably also *maestro di cappella* of S Maria in Trastevere at the end of his life.

It is not known whether Olivieri was related to the Giuseppe Olivieri who replaced Cifra at S Giovanni in Laterano in 1624, the bass Onofrio Olivieri, who was at S Maria Maggiore from January 1641 to October 1674, or the teacher Angelo Olivieri.

WORKS

Motet, 3vv, in *R. Floridus de Silvestris . . . istas alias cantiones* (Rome, 1668)
Motet, 2vv, in *R. Floridus de Silvestris . . . sacras cantiones* (Rome, 1672)

JEAN LIONNET

Olivo [Olivi], **Simpliciano** [Sempliciano] (*b* Mantua, 1594; *d* Parma, 20 Sept 1680). Italian composer. He probably received his musical education at Mantua. On 3 July 1631 he was appointed *maestro di cappella* of the Madonna della Steccata, Parma; he took up the post on 17 December in that year. He retired on 6 October 1679. The vocal writing in his op.2 psalms is typical of the polychoral style of the time, but he made the instruments unusually prominent by giving them independent interludes. His only surviving music is sacred; two operas, an equestrian entertainment and an oratorio are lost, as is a collection of madrigals attributed to him and dated 1681 by Fétis. Walther gave the date of the collection as 1618.

□

Ollone, Max(imilien Paul Marie Félix) d' (*b* Besançon, 13 June 1875; *d* Paris, 15 May 1959). French composer, conductor and critic. Born into an aristocratic family with a lengthy, distinguished military lineage, d'Ollone struggled to reconcile these inherited responsibilities with his Utopian, socialist perspective of music. Thoroughly committed to the deeper appreciation of music through public education, he strove to impress its pivotal role in the evolution of the human character. He developed this philosophy through the study of theology and symbolist literature, and projected it through opera, his preferred medium of expression.

A pupil of Gédalge, Lavignac, Lenepveu and Massenet at the Paris Conservatoire, d'Ollone reaped numerous honours there and throughout his lengthy career, notably the Prix de Rome (1897) for his cantata, *Frédégonde*. Twice honoured by the Légion d'Honneur (Chevalier in 1926, Officier in 1938), he was appointed director of the Concerts populaires d'Angers (1907–15), at the Ministry of Fine Arts (1916), professor at the Ecole Normale de Musique (1919), Paris Conservatoire (1922), director of the Fontainebleau Conservatory (1923), inspector of music education (1931–42) and director of the Opéra-Comique (1941–4).

D'Ollone espoused an essentially Romantic tonal language based on Wagnerian principles of continuous motivic development, governed by classical and Franckian strictures. As he gained prominence within the administration of French musical education, he led an attack on what he felt to be the institutionalized, progressive dehumanization of music, generated chiefly by the Second Viennese School. His voluminous writings, culminating in the treatises *Le langage musical* (1952) and *Le théâtre lyrique et le public* (1955), disclose a prodigious intellect nurtured by a profoundly ecumenical spirituality.

PAUL-ANDRÉ BEMPÉCHAT

Olmeda, Federico (*b* El Burgo de Osma, 1865; *d* Madrid, 11 Feb 1909). Spanish organist, composer and writer on music. He was a choirboy at Burgo de Osma Cathedral, where he studied with Damián Sanz and León Lobera, first the violin, then the organ and composition. In 1887 he was elected by competition organist of Tudela Cathedral, and in December that year became organist of Burgos Cathedral. In 1903 he was made deputy choirmaster at Burgos and in 1907 choirmaster of the Descalzas Reales in Madrid.

In his brief but stormy life Olmeda was notably active as a composer, organizer, conductor and publicist. After the *Motu proprio* of Pope Pius X, reforming church music, he dedicated himself untiringly to this cause, but his polemic spirit often rendered his efforts useless. His principal writings, apart from his numerous contributions to periodicals and magazines, are his *Memoria de un viaje a Santiago de Galicia* (1895), in which he wrote at length on the Calixtine manuscript, and his *Discurso sobre la orquesta religiosa* (Burgos, 1896). Also of significance is his *Folklore de Castilla* (Burgos, 1902), in which he collected a large number of popular songs. Apart from the masses, motets and psalms which he wrote for Burgos Cathedral, his most important works are chamber music, particularly his beautiful quartet in E♭, and some of his piano music, above all the *Rimas* and the sonatas. His extensive library, which included a large number of manuscripts, old editions of liturgical music and theoretical treatises, was acquired in 1911 by the Hispanic Society of New York.

JOSÉ LÓPEZ-CALO

Olmstead [Olmsted], **Timothy** (*b* Hartford, CT, 12 Nov 1759; *d* Phoenix, Oswego Co., NY, 15 Aug 1848). American composer, tune book compiler, singing master and fifer. During the Revolutionary War he served as a fifer (1775–6) and played in a regimental band (1777–80). After the war he apparently settled in Connecticut and worked as a singing master. He served in the War of 1812, and in his later years lived in Whitestown, New York.

Olmstead compiled *The Musical Olio* (Northampton, MA, 1805, 2/1811), which was devoted mostly to European pieces and favoured the Methodist style, but also contained 25 of his own compositions. Drawing on his experience as a bandsman he also compiled *Martial Music* (Albany, NY, 1807), a collection of instrumental marches and dances, including nearly a dozen of his own. Olmstead's range as a musician was unusual for Americans of his generation. As a psalmodist, he composed in both the indigenous New England idiom and a more Europeanized style, and he also wrote with some skill for instruments.

RICHARD CRAWFORD/DAVID W. MUSIC

Olmütz (Ger.). *See* OLOMOUC.

Olof, Efraim (*b* nr Warsaw, 1685; *d* Toruń, 15 April 1735). Polish theologian and musician of German origin. He was the son of a Protestant pastor, Marcin Olof (1658–1715), who was active mainly in Warsaw and Toruń, and was the compiler of a Polish religious folksong collection, *Zbiór kantycznek* ('Collection of Psalm-Books', Toruń, 1672). Efraim Olof was educated in Toruń and Leipzig and was active as a Protestant preacher in Elblag and Toruń. His work of historical value is *Polnische Lieder Geschichte von polnischen Kirchen Gesängen* (Danzig [now Gdańsk], 1744), which is in three parts: a list of the names of authors of songs, with information about their lives; a survey of the history of Polish ecclesiastical song;

and a list of songs. Among his other works is *Pieśni niektóre z niemieckiego na polski język przetłumaczone* ('Some Songs Translated from the German to Polish', Toruń, 1727).

ALINA NOWAK-ROMANOWICZ

Olof, Theo (*b* Bonn, 5 May 1924). Dutch violinist. His earliest lessons were from his mother; he gave his first performance when he was five years old. From 1933 he studied in Amsterdam with Oskar Back, and his Dutch début was in 1935. After 1945 he made extensive concert tours through Europe, the USA and the USSR. From 1951 to 1971 he was leader of the Residentie-Orkest, The Hague, a post that for a number of years he shared with Herman Krebbers, with whom he also formed a violin duo; Badings, Frid and Kox wrote double concertos for them. Olof gave first performances of violin concertos by Maderna, Ton de Leeuw, Henkemans and Van Vlijmen. From 1974 to 1985 he was leader of the Concertgebouw Orchestra, Amsterdam. He also formed a violin and piano duo with Janine Dacosta. He has written a number of books, including two volumes of autobiography, *Daar sta je dan ...* (The Hague, 1958) and *Daar sta je dan opnieuw* (Nieuwkoop, 1980), and has published rhythmic exercises for string players. He taught at The Hague Conservatory and is an Officer of the Order of Oranje Nassau.

TRUUS DE LEUR

Olofsen, Arnoldus (*b* Elburg, 1695/6; *d* Amsterdam, bur. 14 May 1768). Dutch music publisher and bookseller. On 8 May 1732 Olofsen gave notice of his intended marriage to Dirkje Jacobs in Amsterdam. He was received into the Amsterdam guild of booksellers on 9 August 1734, four days after he had settled up his burghership. In 1742 his annual income was fixed at 800 guilders, while he had his bookshop in Gravenstraat. In 1743 Olofsen was charged with the printing and selling of a 'defamatory' text. Later on he was imprisoned for the dissemination of libellous publications; he was released on 19 November 1749. In the late 1750s the imprint on Olofsen's editions changed to 'Aan [At] de Nieuwe Kerk, over de Voorburgwal'. His widow was buried in Amsterdam on 28 January 1780.

A catalogue of 1755 contains about 80 titles; among them are Olofsen's own printings of chamber music, concertos and vocal pieces of Dutch composers such as J.P.A. Fischer, Leonard Frischmuth, Hurlebusch, Mahaut, F.G. Michelet and Radeker. Besides original Dutch treatises of Leonard Frischmuth, S.T. van Loonsma and Lustig, Olofsen published theoretical works, translated into Dutch by Lustig, of Quantz (1754), Werckmeister (*Orgelproef*, 1755) and the Bach pupil J.M. Schmidt (*Musico-Theologia*, 1756).

Olofsen sometimes used passe-partout title-pages (Scheurleer, 90). As a whole he produced a list of some importance, but owing to his vicious attacks on colleagues (among others the young J.J. Hummel, with whom he had collaborated in 1754–5), Olofsen was not a credit to the guild.

PAUL VAN REIJEN

Olomouc (Ger. Olmütz). Town in Moravia, Czech Republic. It was the capital of Moravia from 1182 until 1642; from 1777 it was the residence of the archbishop. After the Thirty Years War the musical activities of the town centred on the cathedral of St Václav (founded 1109), which had an organ by 1258, the parish church of St Moritz (Mořic), 1257, the Jesuit college, and the Augustinian and Premonstratensian orders in nearby Hradisko. Valuable medieval choral manuscripts are preserved in the cathedral chapter archive. Many of the cathedral Kapellmeister were active as composers: P.J. Rittler (1678–90), T.A. Albertini (1691–1735), V.M. Gurecký (1736–43), J.A. Gurecký (1743–69), Anton Neumann (1769–76), Josef Puschmann (1778–94), Pavel Křížkovský (1872–83), who carried through Cecilian reforms, and Josef Nešvera (1884–1914). Beethoven's *Missa solemnis* was intended for the consecration of Archduke Rudolph as archbishop in 1820, though the work was not finished until 1823.

The violin makers Johann Strobl (1700–53) and Martin Brunner (1724–1801) were active in Olomouc. In 1745 the organ builder Michael Engler of Breslau completed his greatest instrument for St Moritz: a three-manual organ with 41 registers. It was rebuilt with five manuals and 94 registers in 1961, since when it has been used for an annual international organ festival. Other valuable instruments are that of Johann Gottfried Helwig (1730, rebuilt 1977) in the Maria Schneekirche (Panna Maria Sněžná), and the cathedral organ by the Rieger brothers (1886). Important hymnbooks published in Olomouc were the *Kancionál český* of Jan Kunvaldský (1576), the *Kancionál* of Jan Rozenplut (1601) and the *Písně katolické* of Jiří Hlohovský (1622).

From the mid-16th century the Jesuits staged rhetorical declamations and school plays in their university hall, with music before and after. In 1770 a Königliches Städtisches Nationaltheater was erected; in 1830 opera was first accommodated in a new theatre building. Early in 1883 Mahler conducted there for three months. In 1918 the Městské Divadlo (City Theatre) was established (it was renamed Divadlo Oldřicha Stibora in 1958). Karel Nedbal directed the opera there from 1921 to 1928; later conductors were Emanuel Bastl (1928–32), Adolf Heller (1932–40), Nedbal again (1940–45), Iša Krejčí (1945–58), under whose regime nearly 50 operas by Czech composers were produced, Zdeněk Košler (1958–62), Pavel Pokorný (1963–71), Miloš Konvalinka (1972–6) Reginald Kefer (1977–90) and Martin Dubovic (1991–).

There were town musicians (Kunstpfeifer) in Olomouc from 1557 on. Among the most distinguished were Georg Finger (probably related to Gottfried Finger) and Bernard Němec (1683–1751), who possessed as many as 90 different instruments. From 1770 a collegium musicum arranged weekly public concerts. German musical societies established in the 19th century promoted symphonic and choral concerts; these included the Dilettantenverein (1817), the Männergesangverein (1847), the Musikverein (1850), which also supported a public music school, and the Kirchenmusikverein (1869). A Czech musical society, the Žerotín (founded 1880), put on choral concerts, opened its own music school (1888) and staged operas from 1891. It was to the Žerotín that Dvořák dedicated his oratotio *Svatá Ludmila* (1886). In 1945 Czech orchestral players from the former German theatre formed

a new orchestra, the Moravská Filharmonie (Moravian PO). The first conductor, Dalibor Doubek, was succeeded by František Stupka (1946–56), Milivoj Uzelac (1956–60), Jaromír Nohejl (1960–87), Stanislav Macura (1987–92) and Jiří Mikula (from 1992). A chair of musicology was established at Palacký University in 1945; professors have been Robert Smetana (to 1973), Vladimír Hudec (1972–80) and Jan Vičar (from 1980).

JIŘÍ SEHNAL

Olsen, Ole (*b* Hammerfest, 4 July 1850; *d* Oslo, 9 Nov 1927). Norwegian composer and military musician. He studied with Fredrik and Just Lindeman in Trondheim (1865–9) and with David, Paul and Reinecke in Leipzig (1870–74). From 1874 he worked as a music teacher in Christiania [now Oslo], where he also conducted the Christiania Artisan's Choral Society (1876–80), the Music Society (1877–80) and the freemasons' orchestra (1894–1908). In 1884 he was appointed music director of the Akershus 2nd Brigade, and in this position he built up a repertory of Norwegian marches, many of them based on folktunes that he had had a hand in collecting. His concert and stage works are also representative of the nationalist tradition; some of them enjoyed great popularity. The operas were influenced by Wagner's ideas.

WORKS
(*selective list*)

Stage: Stig Hvide (op, Olsen), 1872–6; King Erik XIV, incid music, perf. Vienna, 1882; Svein Uraed, incid music, perf. Christiania, 1890; Lajla (op, Olsen), 1893, Christiania, 8 Oct 1908; Stallo (op, Olsen), 1902; Klippeøerne (op, Olsen), 1904–10

Choral: Ludvig Holberg, cant., 1884; Griffenfeldt, cant., 1897; Nidaros, orat, 1897; Broderbud, cant., n.d.; Fanevakt, male chorus, n.d.; I jotunheimen, male chorus, n.d.

Orch: Sym., G, 1878; Åsgårdsreien, 1878; Petite suite, pf, str, 1902; Hn Conc., 1905; Vaeringetog, n.d.; Ritornell, n.d.; Romance, vn, orch, n.d.; Tarantelle, vc, orch, n.d.

Piano pieces, many military marches

KARI MICHELSEN

Olsen, Poul Rovsing [Rovsing Olsen, Poul] (*b* Copenhagen, 4 Nov 1922; *d* Copenhagen, 2 July 1982). Danish composer and ethnomusicologist. He studied solfège and the piano as a child in Randers, and had organ lessons from Georg Fjelrad (1940–42) while studying law in Århus. Still continuing law studies, he attended the Copenhagen Conservatory (1943–6), where his teachers were Jeppesen (harmony and counterpoint) and Christiansen (piano). On completing his legal training in 1948 he went to France for studies with Boulanger (composition) and Messiaen (analysis). The next year he returned to Copenhagen, where in 1950 he took the conservatory examinations to qualify as a music teacher. He was music critic for the *Morgenbladet* (1945–6), *Information* (1949–53) and the *Berlingske tidende* (1954–74), also working for the Danish Ministry of Education (1949–60), and became archivist of the Dansk Folkemindesamling in 1960. As an ethnomusicologist he took part in expeditions to Greenland and the Persian Gulf, and he taught ethnomusicology at the universities of Lund (1967–9) and Copenhagen (from 1969). In 1967 he was appointed to the executive board of the International Folk Music Council and was its president from 1977. He was chairman of the Danish Composers' Union from 1962 to 1967, serving on its executive board thereafter. In addition, he was chairman of the Danish section of NOMUS (the committee for musical cooperation among Nordic countries, 1963–72) and in 1974 became chairman of the music section of Statens Kunstfond.

In early works Olsen's style reflected Bartók, Stravinsky and Nielsen. The Trio op.18 shows a growing interest in traditional musics, and his experimental concerns were stimulated by his participation in the 1952 American Seminar in Salzburg, led by Babbitt. He first used 12-note principles in the Symphonic Variations op.27; subsequently he employed serial techniques in various ways, notably in *Prolana* op.33 and the Inventions op.38. The Passacaglia op.45 submits to total serial organization, and at the same time it was his last consciously serial work. In the 1960s, in such works as *A l'inconnu* op.48 and *Patet* op.55, his ethnomusicological research began to influence some of his compositional attitudes: rhythm became a primary feature, its simple organization (often based on non-Western formal concepts) presenting contrasts between free movement and patterns that are metrically complex and often long. This stylistic approach was integrated with a 12-note technique in his two operas *Belisa* (1964) and *Usher* (1980) and in orchestral and chamber works such as *Au fond de la nuit* (1968) and the string trio *A Dream in Violet* (1982). Among the awards he received are the Lange-Müller Stipend (1955), the Anckerske Legat (1956), the KODA Prize (1960), the Carl Nielsen Prize (1965) and awards from Statens Kunstfond (1966, 1970, 1974).

WILLIAM H. REYNOLDS/JENS BRINCKER

Olsson, Otto (Emanuel) (*b* Stockholm, 19 Dec 1879; *d* Stockholm, 1 Sept 1964). Swedish organist and composer. At the Swedish Royal Academy of Music he studied organ with Lagergren (examination 1896) and theory and composition with Dente (examination 1899). Subsequently he joined the conservatory staff, teaching harmony (1908–24) and organ (1924–45, from 1926 as professor). He also held the post of organist at the Gustav Vasa church in Stockholm. One of the great organ virtuosos of his time, he had a particular reputation for French music, in which he continued the tradition of Emil Sjögren. His teaching influenced several generations of Swedish church musicians, and he helped to develop church music in Sweden, after a long period of decline, as a member of official committees set up to supervise the liturgy and hymnology.

In his compositions Olsson was strongly influenced by French organ music, but he had a sure feeling for counterpoint and so was able to give a firm foundation to his late Romantic style. A growing interest in earlier music is displayed in the six *Gregorianska melodier* op.30 (1910), in which the plainchant themes are treated with a well-balanced interplay of spare counterpoint and melodic-harmonic fullness. The *Sex latinska hymner* op.40 for chorus (1919) also show a firm combination of polyphony with conventional harmonic progressions, though Olsson's use of polytonality brings them to a stage of technical advance not found in other Swedish choral works of the period (nor in any other compositions of his). His largest and best-known work is the *Te Deum* op.25 for chorus, string orchestra, harp and organ (1906), a masterpiece of Swedish church music.

Apart from this, Olsson's best pieces are for the organ, the earliest of them being the Suite in G op.20. The Fantasy and Fugue op.29, a composition in Phrygian E on the chorale *Vi lofva dig, o store Gud*, introduced a new style into Swedish organ music, notably in its polyphonic treatment of an old church hymn. The development initiated by this work culminated in the *Credo symphoniacum* op.50, a three-movement symphony on Gregorian themes written for the ecumenical meeting at Uppsala in 1925. Other pieces, such as the great Sonata in E op.38 and the three preludes and fugues, show Olsson retaining late Romantic traditions. His remaining works include a fine quartet (op.10) and other instrumental pieces; some of his folksong arrangements and original pieces for male chorus have remained in the repertory.

WORKS
(*selective list*)

Choral: TeD, op.25, chorus, str, hp, org, 1906; 6 körsånger, op.32, unacc., *c*1909; Advents- och julsånger, op.33, chorus, org; 6 latinska hymner, op.40, unacc., 1919; *c*25 pieces and arrs. for male vv

Songs: 3 psalmer av David, op.41; 3 bröllopssånger, op.57, 1942

Chbr: 3 str qts: G, op.10, G, op.27, a, op.58, 1950; pf pieces

Org: Miniatyrer, op.5, 1895–?1900; 5 kanon, op.18, 1903–10; Suite, G, op.20, 1904; 5 pedalstudier, op.26; Fantasy and Fugue, Phrygian E, op.29, 1909; Gregorianska melodier, bk 1, op.30, 1910; 12 orgelstycken över koralmotiv, op.36; Sonata, E, op.38, ?1910; Prelude and Fugue, c♯, op.39, 1910; Variationer över 'Ave maris stella', op.42; 5 trios, op.44, ?1911; Gregorianska melodier, bk 2, op.47, ?1912; Credo symphoniacum, op.50, 1925; Prelude and Fugue, f♯, op.52, 1918; Prelude and Fugue, d♯, op.56, 1935

Principal publisher: Nordiska Musikförlaget

HANS ÅSTRAND

Olsvai, Imre (*b* Budapest, 2 April 1931). Hungarian ethnomusicologist and composer. He studied at the Liszt Academy of Music under Kodály, Szabolcsi, Lajos Bárdos and Endre Szervánszky, taking diplomas in musicology (1956) and composition (1958). In 1958 he became a research fellow of the Folk Music Research Group (later a department of the Institute of Musicology of the Hungarian Academy of Sciences) and worked with Pál Járdányi on the systematization of Hungarian strophic

folksongs (1958–66), developing a strictly musical method based on tune types. On the basis of this system he edited the sixth and seventh volumes of the Corpus Musicae Popularis Hungaricae. In 1966 he spent nine months in Egypt, studying Egyptian folk and art music. His research has centred on the development of variants of basic melodic patterns in Hungarian folk music, particularly in that of the Trans-Danubian area. His intensive fieldwork (1947–65) resulted in the transcription of about 8000 tunes from 150 villages in Hungary and Hungarian-speaking areas of Slovakia and Yugoslavia. His compositions include a Rondo for violin and piano (1954), a Piano Sonata (1956), some choruses, and arrangements of folksongs, mostly with folkdance choreography.

MARIA DOMOKOS

Olszewska [Olczewska], **Maria** [Berchtenbreitner, Marie] (*b* Ludwigsschwaige, nr Donauwörth, 12 Aug 1892; *d* Klagenfurt, 17 May 1969). German mezzo-contralto. She studied in Munich and made her début as a Page in *Tannhäuser* at Krefeld in 1915. After an engagement at Leipzig she sang at the Hamburg Opera, where she took part in the joint première (with Cologne) of Korngold's *Die tote Stadt* (1920). She sang regularly in Vienna (1921–30). She also appeared frequently at the Staatsoper in Munich, and at Covent Garden (1924–32), where her performances in such roles as Fricka, Ortrud, Brangäne, Octavian, Orlofsky (*Die Fledermaus*) and Herodias (*Salome*) drew the highest critical acclaim. Her Carmen and Amneris were less successful. She sang in Chicago (1928–32) and at the Metropolitan (1933–5). Olszewska possessed a rich, beautiful voice and great dramatic temperament; Ernest Newman wrote that 'she makes us feel for the moment that the whole drama centres in her'. She made a number of recordings, including the role of Octavian in the renowned 1933 abridged version of *Der Rosenkavalier*.

HAROLD ROSENTHAL/ALAN BLYTH

Olthof [Althof], **Statius** (*b* Osnabrück, 1555; *d* Rostock, 28 Feb 1629). German composer and teacher. The son of a pastor, he studied theology in Brunswick. After a brief stay in Lübeck he moved in 1579 to Rostock where he remained until his death. There, he served first as Kantor, then as *cantor primarius*, and finally from 1593 as Konrektor. He retired in 1614. Olthof's importance as a composer is for his contribution of 40 four-voice homophonic pieces to a new, annotated edition of the *Psalmorum Davidis paraphrasis poetica* at the request of the editor, Natan Chyträus. These Latin psalm paraphrases, written by the Scotsman George Buchanan, originally appeared in Antwerp, Paris and Strasbourg in 1566. The new edition by Chyträus, a Rostock professor (later Rektor of the Bremen Gymnasium), was published simultaneously in 1585 in Frankfurt and Herborn – then a centre of German Calvinism. It was reprinted at least 17 times in Herborn up to 1664 and once in Bremen in 1618. During the 17th century it was widely used in German schools for humanistic studies, often in place of the Horatian ode settings that Buchanan had taken as the model for his own paraphrases. Many churches and schools specified the regular use of the Chyträus-Althof (sic) psalm settings in their services and exercises. The pieces contributed by Olthof were not all his own: four, for instance, are by Martin Agricola and even some of his own are based on existing melodies.

WALTER BLANKENBURG

Olympus the Mysian (*fl* ?*c*700 BCE). Ancient Phrygian aulete and composer. Possibly a legendary figure, he was credited with the introduction of instrumental music into Greece (Pseudo-Plutarch, *On Music*, 1132f), and specifically of auletic *nomoi* (*see* NOMOS), which became established in public worship. It is unclear whether this Olympus is a descendant of the one supposed to have been taught by MARSYAS or whether the two figures named Olympus are one and the same (*On Music*, 1133d–f; cf *Suda*, see under 'Olympos'). In any event, according to Aristoxenus (as quoted in Pseudo-Plutarch's *On Music*) he 'invented' the enharmonic genus, the Lydian mode and rhythmic patterns such as the prosodiac, choreic and bacchic (1134f–1135a, 1136c, 1141b and 1143b).

The figure of Olympus is evidently shadowy; to him were attributed the historical innovations, uncertainly comprehended in later times, which were introduced into Greek music from Asia Minor and especially from Phrygia around the end of the 8th century BCE. After that time 7th-century art shows that the aulos came into general

use, and certain auletic *nomoi* gained lasting acceptance. Three centuries later poets still referred to compositions of this type as the work of Olympus (Aristophanes, *Knights*, 9; Telestes of Selinus: Edmonds, frags.2–3), and philosophers praised them for their acknowledged power to influence the ETHOS of men with a sense of the divine (Plato, *Symposium*, 215c1–6; Aristotle, *Politics*, 1340a8–12). Pseudo-Plutarch attributed several famous *nomoi* to Olympus (1133d–f), described the general simplicity of his style (1137a–b) and analysed the ethos of the Athena *nomos* (1143b–c).

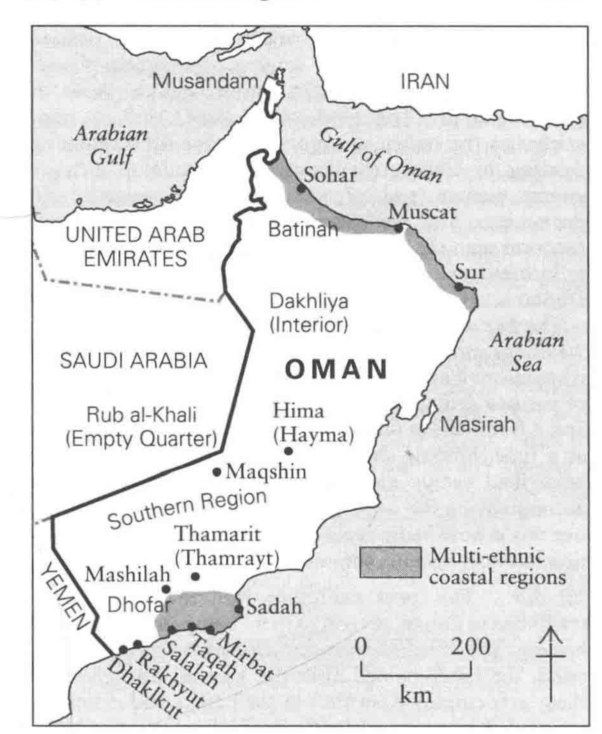
WARREN ANDERSON/THOMAS J. MATHIESEN

Olyver. *See* OLIVER.



Oman. Country in south-eastern Arabia.

1. Introduction. 2. Cultural regions: (i) The Dhofar (ii) Sur (iii) The interior provinces (iv) The Batina. 3. Performers and performance events. 4. Musical instruments. 5. Documentation and research.

1. INTRODUCTION. The current territory of the Sultanate of Oman constitutes the core of a former empire of possessions and coastal trade routes that flourished in the first half of the 19th century. This declined into progressive isolation until 1970 when, following the discovery of oil, the present state was consolidated and gradually opened to global relations. The richness and diversity of performing practices in Oman in the late 20th century reflects historical trade relations and population movements, particularly those that brought substantial numbers of Africans and Baluchis to eastern Arabia. Omani society is transforming from a weakly governed tribal system into an Arab nation-state. The ongoing processes of negotiation among heterogeneous ethnic groups have drawn expressive behaviour into the centre of personal, social and national concerns; performances that combine music, poetry and dance are particularly important. Recent innovations also include a symphony orchestra in the capital, Muscat, and the legalization of dish antennas that give access to global television broadcasts.

2. CULTURAL REGIONS. Within Oman there are several broad cultural regions with distinctive characteristics (fig.1). The coastal areas are culturally and ethnically oriented towards the sea. Substantial populations of Baluch, Iranian and African origin on the north-eastern coastal plain (the Batina) have maintained specific practices, side-by-side with dominant sedentary Arabs and sedentarized Bedouins. The port city of Sur, on the central Omani coast, formerly a hub of the African slave trade, has its own heavily African traditions with strong Sudanese elements. The same applies to coastal Dhofar around the ports of Salala and Mirbat.

The interior, known as 'Inner Oman', is orientated towards the desert and adjoins the 'Empty Quarter' shared with Saudi Arabia. The population is almost exclusively Arab, with much emphasis on Bedouin values, tribal descent and an Islamic orthodoxy which discourages most

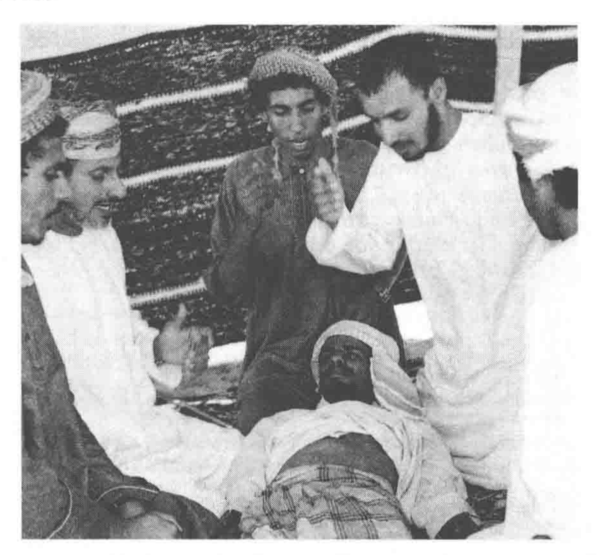
1. *Map of Oman*

musical performances and particularly proscribes the ownership and use of musical instruments. The mountains and southern coastal regions which border on Yemen have a proto-Arabic population practising distinct musical forms. The Musandam peninsula, the northernmost Omani exclave on the entrance to the Gulf of Oman, also has an autochthonous population with local musical traditions.

Regional characteristics have to be seen against pervasive commonalities that cross regions and genres. Dances with weapons in which two facing lines of dancers antiphonally recite poetry – much of it panegyric – or march in a procession, wielding guns, swords or sticks, are widespread. They are known as *'āzī*, *ayyāla*, *wahhābīyya*, *razfa* or *razḥa* in the north, and as *hubbūt* (for the processional form) in the south. These dances are associated with the Arab/Bedouin element that is culturally hegemonic in the evolving nation-state. Together with the recitation of Bedouin/Arab poetry in the assembly of men (*majlis*) and the performance on camel-back of Bedouin songs (*wanna* and *ṭaghrūd*), they have become the symbolic expression of Omani identity. This is privileged in state television broadcasts and at national events, to the exclusion of most other ethnically marked forms. Noteworthy exceptions are the 'sea arts' (*funūn al-baḥr*), which are folklorized revivals of sailors' work songs that recall the erstwhile Omani domination of the Indian Ocean. These have predominantly African characteristics and are performed by Omanis of African descent.

(i) The Dhofar. The towns of Salala and Mirbat are important centres for arts performed by professionals of African descent, many of them patronized by the sultan's court. The *rabūba* or *rabābab* (probably from *rabāb*, spike fiddle) is a dance in which two facing lines of men and

women pass through each other in a highly stylized pattern, accompanied by singing, drumming, hand-clapping and ululation. The drums include those of *musundu* type. The *shubāniyya* (fig.2), an art that celebrates the return of sailors, calls for the alternating dancing of elaborately dressed and made-up girls or young women and of men, to men's singing and drumming. The *shubāniyya*, having lost its original function with the disappearance of sailing ships, is being folklorized, as are several other African-Omani arts in the Dhofar and in Sur.



The *bar'a* in contrast, continues as an integral part of weddings and votive events. In this art a chorus of women responds to a male lead singer (*muṭrib*) within the texture of various drums including the small cylindrical *mirwās* and a frame drum (*daff*). Male spectators dance one pair at a time, holding short daggers and moving in tightly prescribed jumps and turns. The melodic instrument accompanying the *bar'a* was formerly the flute (*qaṣāba*), but this is now being replaced by the *'ūd* lute. Amplification has now become common.

(ii) Sur. This port maintains the strongest African traditions in Oman, several of them being associated with healing. These include *maydān*, *mikwāra*, and *ṭanbūra* or *nūbā*, the latter named after the East African lyre. All these arts employ Kiswahili in their texts and drums of *musundu* type along with cylindrical drums.

(iii) The interior provinces. West of the coastal belt, all of Oman is characterized by arts with predominantly Arab/Bedouin traits that correspond with those found elsewhere among Arabs in Southern Arabia. We find men's dances with weapons, the use of short strophes, a narrow melodic range (rarely exceeding a 5th), and overlapping cycles of metric patterns, melodic-textual phrases and dance movements. The most significant element of these arts is the versed poetry (*shalla*) in dialectic Arabic. This praises the sultan, *shaykh*s or a locality, or alternatively may narrate historical events or impart moral or practical advice. The Bedouin healing ritual (*ra'ba*) is enacted to treat snake bites and malaria (fig.3). It consists of the responsorial shouting of short, narrow-ranged melodic phrases by men kneeling closely along the stretched-out patient (*see* YEMEN, §I, 1(vi)).

2. Folklorized performance of shubāniyya dance formerly used to welcome returning sailors, Mirbat, 1991

3. Bedouin healing ritual (ra'ba), Maqshin oasis, 1991

(iv) The Batina. This wide northern plain, and in particular its coastal palm belt, houses a very diverse population, the result of migrations from the inner Gulf, southern Iran, Baluchistan and East Africa, and the progressive sedentarization of Bedouin nomads. Performance groups and arts mirror the ethnic situation. The masked dance and hand puppet theatre (*pakit*) of the Ajam people with poetry in a Persian dialect is found only in Sohar and Sahham. In Sohar, Sahham and the adjoining Muscat and Zahirah regions men and women participate in the *laro* dance. We also find the Baluch *sayrawan* performance, and the *mālid* religious ritual performed in its Shi'a and Sunni forms by long-settled Arabs. Certain repertories of women's songs (*ghinā' nisā'*) and men's dances (*kwāsa* and *liwā*) and the *zār* healing ritual are deemed to be the privilege of descendants of African slaves.

The arts with weapons, generically known as the *razīf* and associated with the Arab majority, represent tribal and residential groups through local variants of general Arab/Bedouin practices. In the *wahhābiyya* or *'ayyāla*, two lines of men face each other at a distance of ten to 15 metres, reciting in turn rhymed poetry over short phrases of narrow melodic range. Individual dancers (*zāfin*) carrying swords or other weapons circle counter-clockwise; they dance between the lines and may conduct sword duels. The accompaniment consists of at least the two cylindrical drums, *kāsir* and *raḥmānī*. The drummers, usually of African descent, 'visit' the lines in turn, whereupon the men lean on their long sticks, bow and hold their heads obliquely while nodding in synchrony with the drumbeats (fig.4). The cycles of melodic/poetic phrases, drumming patterns, drummers' visits and dance movements are of unequal length; they overlap and interlock, thus creating entities that are far greater than any of their components. In ex.1 two lines of dancers alternate in reciting the same text ('Greetings to our sultan, Qābūs bin Sa'īd') 12 times before they proceed to the next verse. The drum cycle is shorter than the melodic phrase/verse; the two come together only after eight repetitions. The movement cycle of the drummers and dancers (not notated here) is completed only after 24

4. *Wahhābiyya (or 'ayyāla) dance with individual dancers (zāfin) carrying weapons, Sohar, Oman, 1992*

verses. The underlying principle of multi-layered cycles is also found in other arts.

Women's songs (*ghinā nisā'*) are performed at weddings and circumcisions by groups known as *firaq al-dān*. These consist of a female or male lead singer (*muṭriba* or *muṭrib*), a chorus (*ḥarim*) and two drummers using *kāsir* and *raḥmānī*. Any member of a *firqat al-dān* may be male or female, although no males (apart from usually at least one drummer) are socially considered as men. Ḥalīma bint Amiīr leads the pre-eminent *firqat al-dān*, which consists solely of women of slave descent.

The *ghinī nisā'* texts consist largely of formulaic praise (*madīḥ*) of the celebrants, the locality or the sultan. They address ritual subjects during the application of henna and at other key phases of the wedding, and they may also draw on popular music of the Gulf region. Texts are presented in responsorial form, the chorus singing a refrain while hand-clapping or dancing. Since the mid-1970s amplification has become integral to the art.

Ex.1 Multi-layered performance of *wahhābiyya* dance with weapons: two lines of dancers alternate in reciting the same text, the drum cycle being shorter than the melodic phrase/verse (Sohar, 1990)

Qurba is a new art which first appeared in Sahham in 1987. It evolved into a highly popular wedding entertainment particularly attracting young males. It is named after its lead instrument, the Scottish bagpipe, which 'sings' popular songs inspired by the Gulf repertory to the accompaniment of several drums and hand-clapping. *Qurba* also draws on other local arts, in particular *ghinā' nisā'*, *liwā*, and the *sūma* which, like *qurba*, permits individual male spectators to enter the performance circle with dance movements that include shoulder-shaking and emphasize the pelvis.

Mālid is a highly complex art that calls for the ability of 'readers' (*qurrā'*) to recite correctly from prose and rhymed writings about the life of the Prophet Muhammad, and for *hawwīm* to accompany their choral responses with stylized movements. The overlapping antiphony of readers and *hawwīm* in the *huwāma* section of the four-part *faṣil al-mālid* generates a form of polyphony highly unusual for West Asia.

The *Zār* (*see* SUDAN, §1 and YEMEN, §I, 7) ritual seeks to appease spirits (*rīḥ al-ḥammār* or *zār*) that have possessed individuals and afflicted them with maladies. It is enacted in various forms such as *'arabī*, *ḥabbash*, *sweḥlī*, each having different melodies, texts and rhythms and addressing different classes of spirits. In all cases, an *abū* or *umm al-zār* ('father or mother of *zār*') sings to the response of a chorus of men and women and over the loud beating of special *zār* drums of cylindrical or conical type which are believed to be inhabited by spirits. All elements of the *zār* cult, which is practised from the Sudan and Egypt to the Arabian Gulf, have prevailingly African characteristics.

3. PERFORMERS AND PERFORMANCE EVENTS. The Omani concept of performance is designated by the Arabic term *fann* (plural *funūn*; literally 'art'). This refers both to the enactment of expressive behavioural skills by an organized group on appropriate occasions and to the body of knowledge, rules and implements associated with such performances. *Fann* does not cover everything that outsiders might consider as 'music', such as the call to prayer (*adhān*), Qur'anic recitation, children's songs and work songs. On the other hand, *fann* extends to movement ('dance'), costumes and paraphernalia (e.g. weapons, incense-burners and amplification equipment), and also to norms of social behaviour.

The arts are enacted on appropriate occasions by formal invitation. The 'arts with weapons' (*razḥa*, etc.) are performed on National Day (18 November, as designated in 1970) and at the two major Muslim festivals, *'Īd al-fiṭr* and *'Īd al-aḍḥā*. This occurs by government order, directly in support of the national policy and hierarchy.

In this evolving nation-state the arts are an arena and medium for the negotiation of identity. Weddings and circumcision ceremonies call for enactments that differ regionally. In the Batina (northern coast) all weddings will have women's songs (*ghinā' al-nisā'*) including ritual henna songs, but additional arts depend on the ethnic identity the celebrants wish to project. If Bedouin, *razfa badawīyyah* is performed; if Baluch, the celebrants invite *laro* or *sayrawan* artists. If they wish to appear religious, there is a votive ritual in praise of the Prophet Muhammad (*mālid*, the local rendition of *mawlid*; *see* ISLAMIC RELIGIOUS MUSIC, §II, 4). The young and progressive patronize the *qurba* (see §(iv) below), while affluent urbanites seek to engage as many different groups as are available.

Performance of any art requires an organized group of people with the appropriate skills. The 'arts with weapons' are performed by teams (*firāq*, sing. *firqa*) that represent particular tribal or residential groups; they are not paid for their performances. Their leader (*ra'īs*, *'aqīd* or *mas'ūl*) and his helpers are usually determined by consent and confirmed by the respective *shaykh*; the general participants are volunteers from the male population. (In the Batina, circles of men who praise the Prophet Muhammad in performances of *mālid* are similarly constituted under a *khalīfa* and a *shawwūsh*.) YŪSIF AL-MAQBĀLI leads his village *wahhābiyya* team ('arts with weapons') and as a government functionary he organizes 'official' representation of Sohar province through the arts.

Other types of performance groups work for remuneration. They include men and women, almost always of African slave origin. These groups do not represent any larger social entity such as a tribe or village. They are also characterized by complex issues of ownership claimed through inheritance of the drums. ṬĀLIB BIN GHARĪB, who is of slave descent, is leader of a variety of slave-associated male arts.

Some slave-related professional groups include males known as *wilād al-hawā* ('sons of love') who are socially considered not to be men and may enter the spheres of non-related women. Women of slave descent have the freedom and privilege to perform before non-related men. This means that in gender-segregated events, performance groups containing 'slave' women and *wilād al-hawā* males may entertain and enact rituals in both the public/male and private/female domains.

4. MUSICAL INSTRUMENTS. The most prominent category of instruments, eponymic for enacting the arts, are the drums *ṭubūl*, (sing. *ṭabl*). 'Carrying the drums', 'making a (drum) beat', and 'having the drums' are all idiomatic expressions where *al-ṭabl* does not stand for a particular instrument but designates a social event (*ramsa*) at which music is performed. Several types of drums are common. Double-headed cylindrical drums in varying sizes have membranes which are tightened by lacing. They are usually played in pairs called *zāna* or *al-kāsir wa al-raḥmānī*. These terms refer to distinct musical functions, not necessarily to any particular size. The drums belong to an organological type found all over the Middle East and Europe. Of African origin are the conical drums usually called *musundu* or *msindu* whose single membrane is always attached with wooden pegs. Single-headed frame drums known as *ṭār* or *daff* are used in various forms or sizes, with or without attached rattles, by men or women; varying contexts include votive rituals, wedding and circumcision ceremonies and television entertainment. During weddings and circumcisions, they often appear together with pairs of small cymbals (*ṭūs*, sing. *ṭasa*).

Of the wind instruments, the double clarinet (*jifte*) is specific to the Baluch of the Batina. The oboe (*mizmār* or *ṣurnāy*) is the essential instrument of the *liwā* dance and is of the common West Asian type. The *jifte* and *mizmār* (which is difficult to play) are both being replaced by the Scottish bagpipe (*qurba*) introduced by military musicians, whose sound quality is perceived as similar. Side-blown trumpets (*barghūm*) made from antelope horns are on occasion used in the dances with weapons. The end-blown conch trumpet (*jim*), for which, locally, African

origins are claimed, is used in *liwā* and the *funūn al-baḥr*. The end-blown flute (*qaṣāba*) is reported only from the Dhofar and is now very rare, as is the spike fiddle *rabāba*. The six-string lyre (*ṭanbūra* or *nūbān*) of East African origin is played exclusively by musicians of African descent in Sur. The Egyptian and Lebanese type of short-necked lute (*'ūd*) is slowly expanding in popularity. In the south it has already replaced the flute and *rabāba*, and it is at the centre of a new performance genre, *'ūd*, that is finding its place in wedding celebrations.

5. DOCUMENTATION AND RESEARCH. The Oman Centre for Traditional Music in Muscat was established 1985. It conducts and sponsors research and houses a large and growing archive of video and audio documents relating to Oman traditional arts and crafts.

DIETER CHRISTENSEN

Omar, Yusuf (*b* Baghdad, 1918; *d* Baghdad, 1986). Iraqi traditional singer. He was one of the greatest performers of the Iraqi *maqām* and the only professional singer in the 20th century to master the totality of its large repertory. He attended a Qur'anic school, then an elementary public school. He was brought up with a passion for the Iraqi *maqām* and took Mohammed al-Gubantchi as his model and master, following his performances and learning by observing him. Omar's musical tendency was naturally more conservative than his master's, and that led him to become a more traditional performer. In 1948 Omar joined the Baghdad radio station to present two concerts each month; this was the beginning of a lifelong and regular collaboration with the local media (both radio and television), and he remained the principal representative of traditional music until the end of his life. He presented almost all the *maqām*s on the television and illustrated them with explanations in a programme designed to introduce the *maqām* to the public. He participated in house concerts and was a regular performer in the religious rituals of *al mawled al nabawi* and the Sufi *dhikr*. He travelled extensively, invited either by Iraqi communities abroad or by Iraqi cultural centres, but remained unknown to the public who generally attended international festivals, as they were more used to *'ūd* performances. He preferred singing with the traditional *chālghī baghdādī* ensemble and the highly emotional quality of his interpretation often moved him and his audiences to tears. Three CDs published in France illustrate the quality of his art.

SCHEHERAZADE QASSIM HASSAN

Ombra (It.: 'shade'). A term used for an operatic scene involving the appearance of an oracle or demons, witches or ghosts. Such scenes can be traced back to the early days of opera and were commonplace in the 17th century in Italy (e.g. Monteverdi's *Orfeo*, Cavalli's *Giasone*) and in the French *tragédie en musique* (e.g. Lully's *Amadis*, Collasse's *Enée et Lavinie*). Operas based on the legends of Orpheus, Iphigenia and Alcestis provide numerous examples, extending well into the 18th century, including works by Jommelli and Gluck. Abert applied the term to certain accompanied recitatives by Hasse and Jommelli.

Ombra scenes proved popular with audiences not only because of the special stage effects employed but also because of the increasing use of awe-inspiring musical effects. By the end of the 18th century they had come to be associated with an elaborate set of musical features including slow sustained writing (reminiscent of church music), the use of flat keys (especially in the minor), angular melodic lines, chromaticism and dissonance, dotted rhythms and syncopation, pauses, tremolando effects, sudden dynamic contrasts, unexpected harmonic progressions and unusual instrumentation, especially involving trombones. Parallels can be drawn between these features and Edmund Burke's 'sublime of terror', thus placing *ombra* music in an important position in the context of 18th-century aesthetic theory.

Music incorporating *ombra* elements gradually began to appear outside opera, such as in oratorios (e.g. Handel's *Saul*), in parts of mass (especially requiem) settings and in instrumental music, most frequently in slow introductions to symphonies. It therefore provides a source for topical references for many composers. Mozart used the *ombra* style in his operas (e.g. the Oracle in *Idomeneo*, the Statue in *Don Giovanni*) and his instrumental writing (the slow introduction to the Prague symphony K504). Haydn's 'Representation of Chaos' in *The Creation* incorporates several *ombra* characteristics, as do the introductions to symphonies by Krommer and J.M. Kraus, among others.

Operas with supernatural scenes maintained their popularity into the 19th century, including Weber's *Der Freischütz*, Marschner's *Der Vampyr* and *Hans Heiling*, Berlioz's *Les Troyens* and various versions of Shakespeare's *Macbeth* and *Hamlet*. Schubert's *Der Doppelgänger* is a notable example of a song with *ombra* undertones. In the 20th century, *ombra* features can still

be found in opera, such as Britten's *The Turn of the Screw*, and the style has become a cliché in film music, most obviously in the horror genre.

CLIVE McCLELLAND

O'Mara, Joseph (*b* Limerick, 16 July 1861; *d* Dublin, 5 Aug 1927). Irish tenor. He studied in Milan with Moretti and made his début at the Royal English Opera House, London on 4 February 1891 in the title role of Sullivan's *Ivanhoe*. After further study with Perini and Edwin Holland, he was engaged by Augustus Harris for a tour of the British Isles, singing Lohengrin, Walther, Don José and other roles. In 1896 he created Mike in Stanford's *Shamus O'Brien* at the Opera Comique, London. From 1902 to 1908 he was leading tenor of the Moody-Manners Company, and in 1910 joined Beecham's company at Covent Garden. In 1912 he founded the O'Mara Grand Opera Company, appearing often with it until 1924. In addition to producing the popular repertory, he mounted Catalani's *La Wally* and Kienzl's *Der Evangelimann*, given for the first time in English under the title of *The Apostle of St Omar* (1924, Dublin). O'Mara had a repertory of 67 roles.

HAROLD ROSENTHAL/GEORGE BIDDLECOMBE

Omnitonic horn. A crooked horn, whereby all the crooks are incorporated into the instrument, enabling the player to select any key instantaneously. *See* HORN, §3(i).

ONCE. Group of American composers and avant-garde artists. The group evolved in the late 1950s in Ann Arbor, Michigan; its central figure was the composer Robert Ashley. Other composers who were members included Gordon Mumma, co-organizer with Ashley of the ONCE festivals, Roger Reynolds, who was active in the founding of the group and in the organization of the first festival, George Cacioppo, Donald Scavarda, Bruce Wise and, in later festivals, 'Blue' Gene Tyranny. Artists, filmmakers (notably George Manupelli), architects, poets and performance artists were all involved in ONCE mixed-media activities, and many guest composers and musicians took part. ONCE festivals were given annually during the period 1961–8, and the ONCE Group, a smaller performance art ensemble founded by Ashley, performed, recorded and toured from 1965 to 1969. After Ashley moved to California in 1969, ONCE activities declined in importance.

The most significant focus for avant-garde mixed-media activity in the Midwest during the 1960s, ONCE sponsored performances of works from the entire range of Cageian and post-Cageian experimental American music; its programmes also included music by prominent European contemporaries and works of the classic modernist repertory. The emphasis that ONCE played on mixed media had an influence on subsequent collaborative ventures in California and New York.

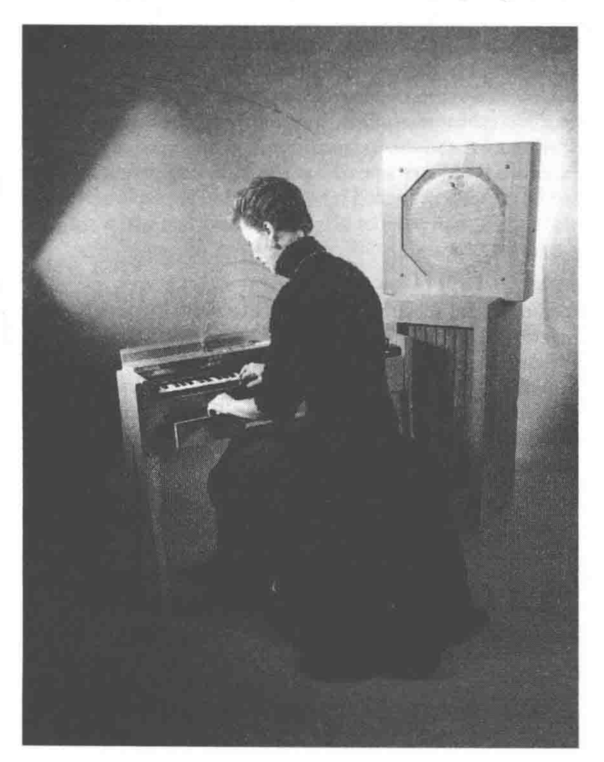
JOHN ROCKWELL

Ondeggiando (It.). *See* ONDULÉ.



Ondes martenot (Fr. 'martenot waves'). A monophonic electronic instrument invented by Maurice Martenot (*b* Paris, 14 Oct 1898; *d* Clichy, nr Paris, 8 Oct 1980), whose original name for it was 'ondes musicales'. Martenot, who had studied piano, cello and composition at the Paris Conservatoire, first presented his instrument on 20 April 1928 as the soloist in Levidis's *Poème symphonique*. He was very active in promoting and developing the instrument (making a world tour in 1930–31), on which his sister Ginette became a leading performer (succeeded by Jeanne Loriod), and it soon found favour with a number of composers including Milhaud, Jolivet, Koechlin, Schmitt, Ibert and Honegger. Varèse first used it as a substitute for the sirens in a performance of *Amériques* (30 May 1929, Paris) and later replaced two theremins by ondes martenot in the revised version of *Ecuatorial*. Messiaen wrote for six ondes martenot in *Fêtes des belles eaux* (1937) and, more importantly, gave a prominent part to the instrument in the *Trois petites liturgies de la présence divine* (1943–4) and the *Turangalîla-symphonie* (1946–8), where the unmistakable association of the instrument with the human voice creates the impression of a goddess-like figure, without the human limitations of range or power. In 1947 Martenot established classes in the ondes martenot at the Paris Conservatoire, and in the same year Jolivet was the first of a dozen composers to write a concerto for it. Apart from concert works (over 700 by 1990) and much film music, it has also been employed in many French theatres, including the Comédie-Française, the Théâtre National Populaire and the Folies-Bergère. More than 70 performers in at least seven countries have at some time specialized in the instrument (with ensembles in France and Montreal), including the composers Pierre Boulez, Maurice Jarre and Gilles Tremblay (early in their careers), Paul Beaver, Tristan Murail and Thomas Bloch.

Some of the enthusiasm which composers felt for the instrument is conveyed by Honegger. In *Je suis compositeur* (Paris, 1951) he compared it with the double bassoon, writing 'The device known as ondes martenot could replace it with advantage. This instrument has power, a speed of utterance, which is not to be compared with those gloomy stove-pipes looming up in orchestras'. The ondes martenot is not specifically a bass instrument, however, for its range extends upwards beyond that of the piano.

The first two versions of the ondes martenot (1928) consisted of two units, in front of which the performer stood: the principal one had a 'pull-wire' operated by a ring for the right index finger, while the left hand manipulated controls on the other unit; a movable pointer above a dummy keyboard indicated the pitch. In the single console of the third version (1929) for a seated

player the pull-wire was replaced by a horizontal wire ribbon controller (*ruban*) incorporating the finger ring, in front of a dummy keyboard. The fourth version (1930) featured only a functioning keyboard and the fifth (1933) combined this with the ribbon controller. The right hand plays both the ribbon and the keyboard, of which each key is capable of slight lateral movement, microtonally shifting the pitch and enabling the performer to create a vibrato. Wide glissando sweeps and expressive portamentos are achieved by sliding the ribbon laterally by means of a ring for the index finger. The sound is produced by a beat-frequency oscillator, based on the heterodyne principle of a radio receiver; a further similarity may be seen in the movement of the pull-wire and ribbon, which, like that of the tuning dial in analogue radio sets, serve to open and close the interleaved plates of a variable capacitor inside the console. The left-hand controls, accessed from a pull-out drawer (seeillustration), feature switches and potentiometers that govern articulation, dynamics, envelope and timbre.

The instrument has been manufactured since 1929, briefly by Gaveau in Paris and from about 1931 by Martenot's own company, Laboratoire des Ondes Musicales Martenot (since the early 1950s called La Lutherie Electronique) at Neuilly-sur-Seine, near Paris. Following the more compact sixth version (1953) a transistorized version was introduced in 1974 and a digital one (designed by Christian Deforeit) in 1993. Non-professional models include one combined with a radio and turntable (*c*1950) and three simplified school models: with ribbon alone (*c*1950), with keyboard alone (1953) and with fewer controls (1980). Of striking design, the loudspeakers include three types based on resonated objects: the *palme* (sympathetic strings), the *diffuseur métallique* (tam-tam) and the *diffuseur à ressorts* (stretched coiled springs). The ondes martenot may be said to be one of the most successful electronic instruments developed before the synthesizer. Following Martenot's death the Association pour la Diffusion et le Développement des Ondes Martenot (ADDOM) was formed in 1981 in Neuilly-sur-Seine.

Ondes martenot played by Cynthia Millar, 1999

RICHARD ORTON/HUGH DAVIES

Ondříček. Czech family of violinists.

(1) **Ignác Ondříček** (*b* Krušovice, 7 May 1807; *d* Prague, 8 Feb 1871). Violinist and conductor. He studied the violin with the village schoolmaster, Šimon Josef Antonín Pergler, who took him into his band. In 1839 he moved to Prague and later formed his own band (1855–70).

(2) **Jan Ondříček** (*b* Bělěc, 6 May 1832; *d* Prague, 13 March 1900). Violinist and conductor, son of (1) Ignác Ondříček. One of the most musically gifted of Ignác's children, he completed his violin studies with Mořic Mildner in Prague and studied theory under Dvořák (with whom he played in the famous Komzák ensemble). Like his father, he was a bandmaster; his ensemble reached a professional standard and formed the core of the orchestra with which the Czech theatre manager Pavel Švanda toured Bohemia. He also taught the violin and the piano. He had 15 children, six of whom outlived him as professional violinists.

(3) **František Ondříček** (*b* Prague, 29 April 1857; *d* Milan, 12 April 1922). Violinist and composer, son of (2) Jan Ondříček. From early childhood he played with his brothers in his father's ensemble. He studied the violin first with Mildner's pupil Jan Weber, and then at the Prague Conservatory with Antonín Bennewitz (1873–6). His accomplishments drew the attention of Wieniawski, who supported him during two years spent at the Paris Conservatoire under L.J. Massart; he left the Conservatoire with a *premier prix*. For two years he played at Pasdeloup's Concerts Populaires and performed elsewhere in France as well as in Brussels, Prague, London and Vienna. A significant event in his career was his giving the first performances of Dvořák's Violin Concerto, in Prague

on 14 October 1883 and in Vienna on 2 December 1883; by this time he was receiving invitations to play throughout Europe, the USA and eastern Russia. His repertory included all the major concertos; he also played solo and chamber works, thereby distinguishing himself from his contemporary violin virtuosos who almost unanimously preferred concertante arrangements and transcriptions.

Stimulated by the lack of original Czech works for the violin, he wrote pieces and composed paraphrases, fantasias and arrangements on themes from Slavonic composers including Smetana, Dvořák, Suk and Glinka. His contemporaries praised his brilliant and flawless technique, the richness of his tone, and the sensitivity and spontaneity of his expression. Appointed *Kammervirtuoso* in 1888, Ondříček settled in Vienna. He taught at the Vienna Conservatory (1909–12) and together with his pupil S. Mittelmann, a physician, he developed a playing methodology described in his *Neue Methode zur Erlangung der Meistertechnik des Violinspiels auf anatomisch-physiologischer Grundlage* (Vienna, 1909). For a time he devoted himself to quartet playing; his quartet took part in the Haydn celebrations in Vienna, playing 20 of Haydn's quartets in five concerts. After World War I he returned to Prague and directed the violin masterclass at the conservatory (1919–22).

WORKS
(*selective list*)

Vn, pf: Ballade, op.1, 1877; Bohemian Dances, op.3 (Berlin, 1891); Fantasia, on themes from Smetana's Prodaná nevěsta [The Bartered Bride], op.9 (Berlin, n.d.); Barcarole, op.10 (Berlin, *c*1910); Romance, op.12 (Berlin, 1892); Bohemian Dance, from The Bartered Bride, arr., op.15 (Berlin, 1895); Fantasia, on themes from Glinka's Zhizn' za tsarya [A Life for the Tsar], op.16, 1889 (Berlin, 1900); Nocturne, op.17, 1900 (Prague, 1900); Scherzo capriccioso, op.18, 1901 (Prague, 1901); Bohemian Rhapsody, op.21 (Leipzig, 1907)

Other works: Str Qt, op.22, 1907 (Prague, 1941); cadenzas to vn concs. by Viotti, Paganini, Grädener, Spohr, Brahms, Mozart (K219, Prague, 1942); rev. of Smetana: Z domoviny [From the Homeland] (Vienna, 1915)

(4) **Emanuel Ondříček** [Ondricek] (*b* Plzeň, 6 Dec 1880; *d* Boston, 30 Dec 1958). Violinist, son of (2) Jan Ondříček. He studied music with his father and at the Prague Conservatory with Ševčík (1894–9). As a violin virtuoso he gave concerts in Russia, the Balkans, Pest, Vienna, Berlin and London (where he first appeared under the pseudonym of Ploris), and made a successful tour of the USA. However, after 1912 he devoted himself exclusively to teaching. In Boston and New York he founded the Ondricek Studios of Violin Art, where his sisters Mary and Augusta also taught. He was a popular teacher, and shortly before his death he was appointed professor of violin at Boston University. His compositions include a string quartet (1924) and violin pieces (some of them arrangements). His teaching experience is contained in his book *The Mastery of Tone-Production and Expression on the Violin* (1931).

(5) **Stanislav Ondříček** (*b* Prague, 23 Aug 1885; *d* Prague, 16 July 1953). Violinist, son of (2) Jan Ondříček. He studied with Ševčík at the Prague Conservatory. He was a violin teacher in Russia, Zagreb and New York; from 1923 until his death he taught in music schools in Czechoslovakia.

B. Šich: *František Ondříček* (Prague, 1947)

JIŘÍ VYSLOUŽIL

Ondříček Quartet. Czech string quartet. It was formed in 1921 under another name by graduates from the Prague Conservatory: Jaroslav Pekelský (*b* Sobotka, 22 Jan 1898; *d* Prague, 12 Jan 1978), violin; Kamil Vyskočil (*b* Prague, 25 Feb 1894; *d* Prague, 20 Dec 1932), violin; Vincenc Zahradník (*b* Tábor, 10 May 1899; *d* Prague, 13 April 1967), viola; Bedřich Jaroš (*b* Radonice nad Ohří, 2 Feb 1896; *d* Prague, 7 Dec 1977), cello. In 1922, after performing Ondříček's Quartet in A♭, and with the composer's consent, the name was changed and the players left the relative security of the Czech Philharmonic organization to devote themselves, under difficult conditions, wholly to chamber music. They began touring abroad in 1924, and from 1927 to 1954 they had a permanent engagement with Czech Radio. After the death of Vyskočil in 1932, Pekelský became second violin, and the first violin was Richard Zika (*b* Vsetín, 9 Jan 1897; *d* Prague, 10 Nov 1947), and after him Josef Holub (*b* Holice v Čechách, 23 Feb 1902; *d* Brno, 11 May 1973). In 1932 the quartet worked with Suk, modelling their style on that of the Czech Quartet. Their regular radio concerts required them to perform a wide repertory. After the war they resumed touring abroad, visiting Britain and the Netherlands in 1946, but when Holub left the quartet in 1956, their activities virtually ceased. The players taught at the Prague Conservatory and Academy.

ALENA NĚMCOVÁ

Ondulé (Fr.; It. *ondeggiando*). A term, or variants of it, used in the 19th century for various ways of creating an undulation in the sound – hence it was occasionally used to describe vibrato. More commonly, however, it referred to a 'wavy' motion executed by moving the bow back and forth across two or more adjacent strings, a device found in violin literature as early as the 17th century. It is, thus, similar to BARIOLAGE. Habeneck (*c*1835) emphasizes that the technique requires a free arm and flexible wrist. *See* BOW, §II, 2(viii).

PETER WALLS

Onegin [Onégin; née Hoffmann], **(Elisabeth Elfriede Emilie) Sigrid** [Lilly] (*b* Stockholm, 1 June 1889; *d* Magliaso, Switzerland, 16 June 1943). Franco-German contralto and mezzo-soprano. Though often described as Swedish, she was in fact the daughter of a French father and a German mother. She sang first as Lilly Hoffmann; after her marriage to Baron Eugene Borisovitch Lvov Onégin (1883–1919) – a Russian émigré, pianist and composer who had adopted the surname of Pushkin's celebrated hero – she used the name Lilly Hoffmann-Onégin, but soon adopted the professional name by which she was to become famous. She studied in Munich and Milan, and later had lessons or advice from Lilli Lehmann and Margarete Siems. She was first engaged by the Stuttgart Opera in 1912; but from 1919 to 1922, after her husband's early death, she was a member of the Hofoper in Munich, and in 1920 married Dr Fritz Penzoldt. She had two Metropolitan Opera seasons (1922–4) and one at Covent Garden (1927), in both houses singing only Amneris and

Wagner roles; she also sang at Salzburg (Gluck's Orpheus, 1931–2) and at Bayreuth (1933–4). Onegin's greatest successes were in concerts, in which she would often sing Rossini arias; she was also a notable interpreter of Brahms's Alto Rhapsody. She had the finest and most highly trained voice of its kind since Schumann-Heink, whose repertory and manner of singing she emulated without approaching the older singer's fire and communicative power. Notwithstanding her rich tone and astonishing technique, her recordings suggest also something marmoreal in their smoothness and coldness of style.

DESMOND SHAWE-TAYLOR

O'Neill, Dennis (*b* Pontardulais, 25 Feb 1948). Welsh tenor. He studied at Sheffield University and with Frederick Cox, and after solo appearances with Scottish Opera's 'Opera for All' (1971) he joined the Glyndebourne chorus (1974) and sang at the Wexford Festival. During two seasons as principal tenor with South Australian Opera, he created a role in Sitsky's *Fiery Tales* (1976). Thereafter he sang lyric roles with Scottish Opera and the WNO, then studied further in Italy with Ettore Campogalliani and Luigi Ricci. His débuts at Covent Garden in 1979 as Flavio (*Norma*) and at Glyndebourne in 1980 as the Italian Tenor (*Der Rosenkavalier*) were followed by leading roles in both theatres and with the ENO. In 1983 he made débuts in the USA at Dallas as Edgardo (*Lucia*) and at the Vienna Staatsoper as Alfredo, a role he also sang with the Metropolitan Opera on tour in 1986 before singing Rodolfo with them in New York the next year. In 1990 he sang Gabriele Adorno in Cologne and Foresto (*Attila*) at Covent Garden, and has subsequently expanded his Verdi repertory to include such roles as Radames, Don Alvaro (*La forza del destino*), Macduff and Otello. O'Neill combines a fine-spun Italianate tone with an intelligent perception of style and character. His recordings include Cavaradossi, Dick Johnson (*La fanciulla del West*) and Verdi's Requiem. A governor of the Welsh College of Music and Drama, he has set up a bursary in his own name to help young WNO singers to study abroad.

NOËL GOODWIN

O'Neill, Francis (*b* Tralibane, Co. Cork, 28 Aug 1848; *d* Chicago, 28 Jan 1936). Irish musician, collector and publisher. Born of farming stock in an Irish-speaking area, O'Neill showed early intellectual promise and played the traditional flute from youth. He went to sea as a teenager and sailed around the world before being shipwrecked and landed in America, where he joined the Chicago police force in 1873 and rose through the ranks to become Chief of Police 1901–5. With a fellow policeman James O'Neill (1863–1947, no relation) as scribe, he began from the 1880s preserving in manuscript melodies remembered from his childhood. He then expanded this activity to collecting Irish music from the many traditional Irish musicians resident in Chicago and from printed and manuscript sources. In 1903 he produced *O'Neill's Music of Ireland: Eighteen Hundred and Fifty Melodies*, the largest collection of Irish music ever published. This was followed by other Chicago-compiled tune collections, chiefly: *The Dance Music of Ireland* (1907), *O'Neill's Irish Music* (2/1915), *Waifs and Strays of Gaelic Melody* (2/1924). The two latter were arranged for piano by Selena O'Neill (no relation). O'Neill also wrote two studies of Irish traditional music which contain a wealth of musical and biographical information: *Irish Folk Music: a Fascinating Hobby* (1910) and *Irish Minstrels and Musicians* (1913). O'Neill's publications, which are mostly still kept in print, were ground-breaking in preserving Irish dance music and have had a great impact on the course of the music in the twentieth century.

NICHOLAS CAROLAN

O'Neill, Norman (Houstoun) (*b* London, 14 March 1875; *d* London, 3 March 1934). English composer and conductor. After studying with Somervell in London (1890–93) he worked under Iwan Knorr in Frankfurt at the Hoch Conservatory (1893–7), where at various times his colleagues were Balfour Gardiner, Cyril Scott, Grainger and Quilter (often known as the 'Frankfurt group' or 'gang'). Although he enjoyed modest success with some of his chamber and orchestral works, particularly before the war, he found his niche in the theatre, where he showed unrivalled skill in the composition of incidental music, a genre in which he produced over 50 scores. Between 1901 and 1908 he wrote incidental music for various theatres in collaboration with John Martin-Harvey. He was permanent conductor of the Theatre Royal, Haymarket, from 1909 to 1919 and from 1920 to 1932, with a temporary move to the St James's Theatre (1919–20). At the Haymarket he won acclaim for his music to Maurice Maeterlinck's *The Blue Bird* (1909), Lord Dunsany's *The Golden Doom* (1912) and especially J.M. Barrie's *Mary Rose* (1920). From 1916 to 1934 O'Neill was treasurer of the Royal Philharmonic Society. A close friend of Delius, he did much to support performances of the composer's work in London. In 1924 he joined the teaching staff of the RAM and also examined for the Associated Board. His wife, Adine O'Neill (née Ruckert), a concert pianist, was for a time London critic of the *Monde musical* and in 1903 became head music mistress at St Paul's Girls' School, Hammersmith.

WORKS

(*selective list*)

INCIDENTAL MUSIC

After All (E.G.E. Lytton), London, 1901–2; The Exile (Osbourne, Strong), London, 1902; Hamlet (W. Shakespeare), op.13, Dublin, 1904; A Lonely Queen, op.22 (J. Comyns Carr), New York, 1906; The Bride of Lammermoor (The Last Heir), op.28 (S. Phillips, after W. Scott), London, 1908; King Lear (Shakespeare), op.36, London, 1909; The Blue Bird, op.37 (M. Maeterlinck), London, 1909; The Gods of the Mountain, op.41 (Dunsany), London, 1911; The Golden Doom, op.44 (Dunsany), London, 1912; The Pretenders, op.45 (H. Ibsen), London, 1913; Through the Green Door (M.V. Vernon), Manchester, 1919; Julius Caesar (Shakespeare), London, 1920; Macbeth (Shakespeare), London, 1920

Mary Rose (J.M. Barrie), London, 1920; Quality Street (Barrie), London, 1921; The Merchant of Venice (Shakespeare), New York, 1922; Success (A.A. Milne), 1923; A Kiss for Garlands (Barrie), London, 1924; Kismet (E. Knoblock), London, 1925; The Man with the Load of Mischief (A. Dukes), London, 1925; Mr Pickwick (C. Hamilton, F.C. Reilly, after C. Dickens), London, 1928; The Ivory Door (Milne), London, 1929; Measure for Measure (Shakespeare), London, 1929; Henry V (Shakespeare), London, 1933

OTHER WORKS

Ballets: A Forest Idyll, *c*1913; Before Dawn, London, 1917; Punch and Judy, London, 1924; Alice in Lumberland, London, 1926
Choral: Waldemar, op.19, solo vv, chorus, orch; 8 National Songs, op.34, unison vv, orch; partsongs, unison songs
Orch: Suite, op.3, str, 1893–7; In Autumn, op.8, ov., 1901; Miniatures, op.14, small orch, 1904; In Springtime, op.21, ov., 1905–6; Miniatures, op.25, 1908; Theme and Variations on an Irish Air, op.29, 1910; A Scotch Rhapsody, op.30, 1911; Humoresque, op.47, ov., 1913; Hornpipe, op.48, 1916; Irish Jig, chbr orch, 1923; Festal Prelude, 1927; 2 Shakespearean Sketches, 1928
Vocal orch: Death on the Hills, op.12 (R. Newmarch), A, orch; La belle dame sans merci, op.31 (J. Keats), Bar, orch; The Farmer and the Fairies (H. Asquith), spkr, orch
Chbr: Variations on 'Pretty Polly Oliver', op.1, pf trio, 1895; Sonata, op.2, vc, pf, 1896; Scherzo and Romance, op.6, vn, pf, 1897; Pf Trio, a, op.7, 1900; Pf Qnt, op.10, 1902–3; Pf Trio, F, op.32, 1909; Berceuse, op.33, vn, pf, 1909; Scherzo, op.52, str qt; 2 Pieces, vn, pf, 1921
Songs: The Indian Serenade (P.B. Shelley), 1900; 2 Songs, op.16 (R. Newmarch), 1904; 5 Rondels, op.18 (W.E. Henley, G. Moore, A. Symons, anon.), 1907; 2 French Songs, op.26 (P. Verlaine, P. Fort), 1907; 2 Songs, op.35 (G. van Ruith, Keats), 1909; A Song Cycle (E. Temple Thurston), 1924; Echoes of Erin (H. Boulton), 1926; others incl. songs from plays
Pf: 4 Compositions, op.4, 1898; Variations and Fugue, op.5, 1898; 3 Pieces, op.15, 1904; Variations and Fugue on an Irish Theme, op.17, 1905; 3 Pieces, op.20, 1906; 2 Studies, op.24, 1911; 3 Old English Pieces, 1919; Suite, 1927; 3 Sketches, 1928

Principal publishers: Bosworth, Cramer, Prowse, Schott

JEREMY DIBBLE

One-step. A fast ballroom dance. It was made popular in New York and England about 1910 by the dancers Vernon and Irene Castle (one variant was called the 'Castle walk'). Danced to a fast march in 2/4 or 6/8 time, at about 60 bars per minute, it consisted of a simple walking step for eight counts with a pivot on the first. By World War I it had spread throughout North America and western Europe. It adopted elements of ragtime (particularly danced to Irving Berlin's *Alexander's Ragtime Band*, 1911), and from about 1912 was gradually absorbed into the various 'trot' dances.

□

Ongala, Remmy [Ramadhani Ongala Mtoro, Dr Remmy] (*b* Kindu, Belgian Congo [now Democratic Republic of Congo], 1947). Tanzanian composer, guitarist and singer. In 1969 Ongala moved to Uganda; he later moved to Kenya to join the band Orchestra Makassy, before settling in Dar es Salaam, Tanzania. After the dissolution of Orchestra Makassy in the early 1980s, he joined and later became the leader of the Orchestra Super Matimila. The socially oriented lyrics of Ongala's songs and the guitar-driven sound of Orchestra Super Matimila appealed to promoters of WOMAD (World of Music, Arts and Dance) in the late 1980s, and Ongala's exposure to international audiences and his recording sessions in Europe confirmed for him a major role in the international development and promotion of African urban musics. His music typically includes three guitars, saxophones, bass, drums, and lead and backup vocals, and his style reflects influences of earlier Congolese musical genres blended with indigenous rhythms and guitar playing styles of East Africa; he credits Franco as an early influence. Ongala, often referred to as 'the Voice of Tanzania', communicates to and for the poor and disaffected, as is reflected in the political and social commentary of many of his songs' lyrics, most of which are in KiSwahili. Ongala refers to his music as *ubongo*, intelligent or 'brain' music; his songs force people to reflect on the issue of inequality and the need for increased AIDS awareness.

Ono, Yoko (*b* Tokyo, 18 Feb 1933). American composer and performance artist of Japanese descent. She attended Sarah Lawrence College, where she studied music and philosophy. She married Ichiyanagi in 1956. In the early 1960s the couple's Manhattan apartment became the site of many performance events; several of the artists who performed there were later associated with Fluxus. Dubbed 'the high priestess of the happening', Ono was a pioneer in the conceptual art movement. She once claimed that 'the only sound that exists ... is the sound of the mind'. Her conceptual scores, described by Maciunas as 'Neo-Haiku Theater', often consist of only brief instructions. *Earth Piece* (1963), for example, instructs the performer to 'listen to the sound of the earth turning'. In *Cut Piece* (1964), Ono invited the audience to cut up her dress. A specialist in extended vocal techniques, her first performance in sound (1961) featured screams, sighs, moans, gasps and multi-phonics. After her marriage to John Lennon in 1969, the couple performed with the Plastic Ono Band, fusing rock and avant-garde styles.

DAVID W. BERNSTEIN

Onori [Onorii], **Romualdo.** *See* HONORIO, ROMUALDO.

Onslow, (André) George (Louis) (*b* Clermont-Ferrand, 27 July 1784; *d* Clermont-Ferrand, 3 Oct 1853). French composer of English descent. His father Edward Onslow came to France in 1781, and two years later married Marie-Rosalie de Bourdeilles de Brantôme. The eldest of four sons, George probably studied the piano in England with J.N. Hüllmandel while still very young. From January 1799 to July 1800 he studied the piano with J.L. Dussek in Hamburg, and then seems to have completed his musical education in England with J.B. Cramer. He recognized his musical vocation in 1801 when he heard the overture to Méhul's *Stratonice*. A gifted amateur, he wrote his first works (opp.1–4) before 1807; they were published by Pleyel. He married Delphine de Fontanges in July 1808. In the same year he asked Reicha, who had just arrived in Paris, to teach him composition. After these lessons he wrote string trios, quartets and quintets, and took up the cello so that he could play chamber music with his friends. He divided his time between the provinces and the capital, spending the winter months in Paris, where he could have his latest works played, particularly at the quartet performances held by Baillot, the Dancla brothers and Tilmant. During the summer of 1829 he had a near-fatal accident when out hunting. While convalescing, he composed the last three movements of a quintet he had begun before the accident. This quintet, op.38, known as 'De la balle', remained the composer's mascot. In 1830 Onslow became the second honorary member of the London Philharmonic Society. In general, he maintained close and friendly relations with the English musical world, particularly with John Ella, George F. Anderson and Dussek's nephew Pio Cianchettini. In 1834 he was elected president of the Athénée Musical. He succeeded Cherubini at the Académie des Beaux-Arts in 1842, and his career became established in these years. He was a founder member of the Association des Artistes Musiciens (1843) and was invited to the Aachen music festival in 1846. Inspired by this visit, he offered the committee of the Niederrheinisches Musikfest his Symphony no.4. It was accepted, and the composer was invited to conduct it at Cologne the next year. This journey must have been his last outside France. In 1852 he was affected by rheumatic pains and failing sight in the left eye, and gave up composing for ever.

Onslow's wealth made him musically independent, freeing him from material constraints and allowing him to devote himself to chamber music without concerning himself with the tastes of the French public. However, he felt a true passion for operatic composition; the existence of an opera (*Les deux oncles*) in autograph manuscript dating from 1806 shows that he had tried his hand at this genre at the same time as composing his very first quintets. This interest in opera is also evident in the composer's correspondence. Although his three operatic works *L'alcade de la vega*, *Le colporteur* and *Guise* were given as comic operas at the time, it is clear that they approached the grand opera genre, which explains the notably cool reception they received from the critics, who thought it inappropriate to stage such dramatic works at the Opéra-Comique. Onslow's operatic language shows a certain monotony in its style. The vocal line is seldom independent of the orchestral accompaniment, and the composer resorts to over-repetitive devices (vocal duets developing in 3rds, scales, chromatic lines, homorhythmic choruses etc.). The large intervals, difficult sequences and excessive chromatism are fairly demanding on the voice. Onslow's instrumental music developed in relatively clear-cut periods. From 1807 to 1832 there is a clear predilection for piano works and string quintets.

Although the majority of his works for solo piano are youthful productions of no real interest, the duos and trios contain pre-Romantic features similar to those found in Hummel, and are of incontestable quality, if formally rather rigid. They are unusual in France at this time for the equal importance assigned to each instrument. Onslow's string quartets and quintets come at the peak of his compositional career. His youthful quartets (opp.8, 9 and 10) are notable for great flexibility of writing, exceptional rhythmic and melodic charm, and great vitality. They are

clear successors to the *quatuor brillant* and the Classical tradition. Between 1817 and 1831 Onslow composed very little for quartet, but in 1832 he returned to form with new and sudden verve. This was probably linked with his discovery of Beethoven's late quartets, which shocked and fascinated him. He composed the most significant of all his quartets (opp.46-56) within three years. With all four instruments now essential to the discourse, these works show great emotional intensity, opening up the way to new harmonic and rhythmic daring, and they contain movements of striking beauty. Finally, from 1835 to 1846, the year when he stopped composing quartets, Onslow moved away from melodic writing to concentrate on more complex thematic structures. This cost him some lack of understanding on the part of the critics, who missed the style and melodic charm of the early works.

The string quintets were composed for an interesting diversity of ensembles. The first, dating from 1806 to 1825 (opp.1 to 25) were written for two violins, viola and two cellos (a viola part being provided to replace the first cello if necessary). After hearing the double-bass player Dragonetti in London, Onslow replaced the second cello with a double bass (opp.32 to 35). With op.37 and its successors he favoured two cellos again, but all the quintets were published with two extra parts, allowing them to be played in any of these combinations. Like the quartets, these quintets bear witness to the richness of Onslow's musical development, which departs from Classicism and embraces a style of composition in which a surprising anticipation of the language of Brahms is apparent. Some of these quintets must undeniably be placed among the great masterpieces of 19th-century chamber music. The end of the composer's life saw him returning to the piano within larger chamber ensembles (the quintets op.76, the sextet op.77b and the septet op.79), probably because of a fashion for large ensembles at the time. These last works, evidence of a delayed pre-Romanticism, do not compare with their predecessors.

Onslow's work was particularly successful in Germany and Austria throughout the first half of the 19th century, as the many editions of his works show. Kistner and Breitkopf & Härtel, in particular, competed for the privilege of publishing Onslow in the German-speaking countries. This passion for a composer compared in turn to Mozart, Beethoven, Schubert and Mendelssohn progressively died down towards the middle of the century. He was less famous in France. His chamber works, although regularly played in musicians' salons, were described as erudite and serious and did not become popular with the general public.

Oosterzee, Cornélie van (*b* Batavia [now Jakarta], 16 Aug 1863; *d* Berlin, 12 Aug 1943). Dutch composer. She studied the piano with C.L.W. Wirtz and music theory with Willem Nicolaï in The Hague. She then went to Berlin to study composition with Rudolf Radecke. After a brief return to the Netherlands, where she received counterpoint tuition from Samuel de Lange, she returned to Berlin to study instrumentation with Heinrich Urban. Her first orchestral work, *Jolanthe*, was performed by the Concertgebouw Orchestra for the opening of the new city theatre in Amsterdam in 1894. Both this and her next work, *Nordische fantasie*, were frequently performed. In 1896 she conducted the first Dutch performance of a four-movement suite, *Königs-Idyllen*, inspired by Tennyson's *Idylls of the King*. In 1898 she wrote and conducted a festive cantata for the opening of the Nationale Tentoonstelling Vrouwenarbeid (National Exhibition of Women's Work) held in The Hague. In 1900 her symphony won second prize from the Allgemeine Deutsche Musikverein and was performed that same year by the Concertgebouw Orchestra conducted by Mengelberg. In 1910 her opera *Das Gelöbnis* was first performed in the Weimar Hoftheater. She regularly contributed articles to the Dutch music magazines *Weekblad voor muziek* and *Caecilia* and ran a column, 'Letters from Berlin', in the *Algemeen Handelsblad*. Through these articles we learn that she greatly admired the music of Wagner and Richard Strauss. Van Oosterzee was knighted by the Order of Oranje-Nassau in 1897 and invited to become a corresponding member of the Maatschappij tot Bevordering der Toonkunst (Association for the Promotion of Music) in 1901. Little is known about the last 25 years of her life. After she died the *Algemeen Handelsblad* ran an article on her, noting that her music had gradually disappeared from programmes because of the increasing attention to younger composers. All Van Oosterzee's large-scale works are lost, perhaps destroyed in Berlin during World War II. Her opera *Das Gelöbnis* is an example of Italian *verismo* in which blood feud, murder and vendetta predominate. Her chamber music is diverse, from simple piano works influenced by her stay in Indonesia (such as the *Javanischen Tanz* and *Malaüshchen Wiegenliedchen* from the *Sechs leichte Stüke* for piano duet), to salon music typical of the 1920s (*Zwei Phantasiestücke* for piano trio). Her German lieder reflect the influence of Schumann and Brahms, her French songs that of Berlioz.

WORKS
(*selective list*)

Stage: Das Gelöbnis (G. Klett and L. von Wittich, after R. Voss), 1910, Weimar, Hoftheatre, 1910, lost

Orch: Jolanthe, ov. 1984, ?lost; Nordische fantasie, 1895; Königs-Idyllen (after A. Tennyson), 1896, lost; Sym., f, 1900, lost

Chbr and solo inst: Str Qt, *c*1888, lost; Pf Qt, c♯, *c*1890, lost; Str Qnt, B♭, *c*1892, lost; Fête costumée, op.15, pf, 1899; 2 Phantasiestücke, op.18, vn, vc, pf, 1900; 4 petites valses capricieuses, op.23, pf; 3 fantaisiestukjes, pf; 6 leichte Stücke, op.55, pf, 1903; Sonata 'Italia', pf, 1903; 3 fantasias, op.58, pf, 1905; Chansons sentimentales, op.54, pf, 1905; Carnaval, 3 fantaisies, op.58, pf, 1905; 6 leichte Stücke, op.55, pf 4 hands, 1905

Vocal: 3 Lieder (H. Heine, P. Heyse), op.3, 1v, pf; Tannhäuserleid (J. Wolff), op.7, 1v, pf; 4 Gesänge, op.12, medium v, pf, 1897; Te Bethlehem (P. de Mont), op.14, SATB, 1899; 2 Gesänge, op.19, 1v, pf, 1900; 2 Stimmungsgedichte (E.A. Hermann, C. Morgenstern), op.21, 1v, pf, 1901; 3 Liebeslieder (G. Klett, Morgenstern, D. von Liliencron), op.22, 1v, pf, 1901; Vieux airs de la Marquise, op.25, 1v, pf; Droomevrouw, kom!, SSA; Madonna, SATB; Berusting, SATB; Avond, SATB; 2 Lieder (L. Rafael, E. Otten), op.59, 1v, pf, 1905; Mignonne (d'Armand Silvestre), 1v, pf; Tanzlied (O.J. Bierbaum), 1v, pf

Principal publishers: G.H. van Eck, A.A. Noske, Ries & Erler, Breitkopf & Härtel, Vuylsteke, Schott

HELEN METZELAAR

Opava (Ger. Troppau). Town in Silesia, Czech Republic. It is the former Silesian regional capital, with a bilingual Czech-German cultural history. From 1656 to 1660 Pavel Josef Vejvanovský studied at the Jesuit college in Opava. Carl Ditters von Dittersdorf worked in nearby Johannisberg and composed operas for the theatre of the local castle. Beethoven gave concerts in a nearby castle in Hradec nad Moravicí (Ger. Grätz) in 1806 and 1811, as did Liszt in 1841 (Liszt also performed in Opava in 1846 and 1848). Pavel Křížkovský, Janáček's teacher, won a scholarship in Opava in 1832; he studied at the local grammar school from 1834 to 1839. The composer, pianist and organist Eduard Mestenhauser (1832–1912) founded the German Singakademie in 1874; J.F. Hummel (1841–1919) was conductor there and for the German men's choir, 1863–73. Other musicians active in Opava were Bruckner's disciple Ludwig Grande (1865–1940), the violinist Herma Studeny (1886–1973), a disciple of Dvořák and Ševčík, and the composer and conductor Miloš Čeleda (1884–1958).

Opera was given from 1790 in the Theater unter dem Stadtturm (built 1750; rebuilt 1774 after a fire in 1763); in 1794 Mozart's *Die Zauberflöte* was staged there. The Městské Divadlo (Municipal Theatre) was built in 1805; major reconstructions were carried out in 1883, in 1909, shortly after World War II and in 1992. Arthur Löwenstein was a conductor there (1929–32); among visiting artists were Marie Gutheil-Schoder and Leo Slezak. Between 1919 and 1938 Czech operas were performed by visiting companies from Ostrava and Olomouc. A professional Czech theatre company (drama, opera, operetta, ballet) was founded in the badly damaged town in 1945. At first, under municipal administration, it was known as the Slezské Národní Divadlo (Silesian National Theatre); after 1949 it became a regional company, making numerous tours. In 1957 it became the Slezské Divadlo Zdeňka Nejedlého; in 1990 it again came under municipal administration and was renamed Slezské Divadlo Opava. The company has performed both Czech and foreign operas from traditional and modern repertories.

Musical associations include the Pěvecko-Hudební Spolek Křížkovský (Křížkovský Singing and Instrumental

Club, founded in 1887), Pěvecké Sdružení Slezských Učitelů (Silesian Teachers' Choir, 1906) and Pěvecké Sdružení Slezských Učitelek (Silesian Women Teachers' Choir, 1958). The Silesian Regional Museum houses a musicological centre (founded 1967) which works together with the musicological department of the Institute of Silesian Studies under the aegis of the Czechoslovak Academy of Sciences. The Silesian Musical Archives (founded 1951) contain collections from the Minorite monastery and from the castle in Hradec nad Moravicí. The *Věstník matice opavské* (Opavian Foundation Gazette) was published from 1891; in 1935 it became the *Slezský sborník* (Silesian Review). Since 1960 Opava has been the seat of the International Beethoven Society, publishing the journal *Československá Beethoveniána*. Since 1961 the annual Nationwide Performers' Competition has been held in Hradec.

EVA HERRMANNOVÁ

Open notes. On valved brass instruments, the notes of the harmonic series produced without lowering any valve. In brass parts, however, 'open' (Fr. *ouvert*, etc.) countermands 'muted' or 'stopped'.

On the natural horn, the notes of the harmonic series, the other pitches being produced by hand-stopping. These open notes are also called NATURAL NOTES.

Open pedal. *See* SUSTAINING PEDAL.

Open position [open harmony]. *See under* SPACING.

Open score. A score in which each individual voice of a polyphonic composition is assigned a separate staff (*see* SCORE and ORGAN SCORE).

Open string. In string instruments, a string played at its full sounding-length without 'stopping' (that is, without touching the string or pressing it down with the finger). In unfretted string instruments in particular there is a difference between the sound of an open string and the sound of a stopped string sounding the same pitch. Open E string on the violin, for instance, has a different timbre from a note of the same pitch produced by stopping the A string a 5th above. Because of this difference, open strings are generally avoided, and since the turn of the 18th century players have generally preferred stopped notes except where, for special effect, an open string is specified – generally by a small 'o' placed over the note (*see* FINGERING, §II, 2(i)). In fretted instruments, such as viols and lutes, there is also a difference between stopped and open strings, but this difference is considerably less than in unfretted instruments because a string stopped by pressing down on a fret has a more 'open' quality than a string stopped on the unfretted fingerboard. In French lute and viol tablature open strings are indicated by 'a', in Italian by a figure '0', and in German tablatures by a different letter for each string.

DAVID D. BOYDEN

Open tuning. A kind of tuning of a guitar, viol, violin or other string instrument in which the open strings are tuned to form a single chord (*see* GUITAR, §8; SCORDATURA; and SYMPATHETIC STRINGS).

Opera (It., from Lat. *opera*, plural of *opus*: 'work'; Fr. *opéra*; Ger. *Oper*). The present article surveys the origins and the history of opera and its presentation. For fuller discussion of the history of individual sub-genres and related genres, the reader is referred to the entries listed below. Discussion of opera houses and operatic activity in particular cities will be found in entries on the cities concerned, and of the works of individual composers within their entries.

I. 'Opera'

Most narrowly conceived, the word 'opera' signifies a drama in which the actors sing throughout. There are, however, so many exceptions among the operatic works of the West – so many works popularly called operas in which some parts are spoken or mimed – that the word should be more generically defined as a drama in which the actors sing some or all of their parts. Numerous sub-genres, such as *opera seria*, *opera buffa*, *tragédie en musique* and the like, have grown up in the history of opera (information about these sub-genres will be found in separate entries). Some of the sub-genres mix spoken and sung drama in conventional ways. Thus, in operetta, Singspiel, *opéra comique* and musical comedy the dialogue is normally spoken and musical numbers interrupt the action from time to time. The history of opera is inextricably intertwined with the history of spoken drama. Moreover, since all operatic works combine music, drama and spectacle, though in varying degrees, all three principal elements should be taken into account in any comprehensive study of the genre, even though music has traditionally played the dominant role in the conception and realization of individual works.

The central importance of Italian musicians and poets in the development and early history of opera is suggested by the fact that the word 'opera' means simply 'work' in Italian and as such was applied to various types of written or improvised plays in the 16th and early 17th centuries. To cite but one example arbitrarily, Francesco Andreini's play *L'ingannata Proserpina* (1611) – according to its

dedication intended to be either recited or sung depending on the wishes of its producers – was called an *opera rappresentativa, e scenica*. The earliest operas either had no generic subtitle (like Ottavio Rinuccini's *Dafne* of 1598 and his *Euridice* of 1600) or else adopted one or another ad hoc definition: *favola*, *opera scenica*, *tragedia musicale*, *opera tragicomica musicale*, *dramma musicale* or the like (see Rosand, C(i)1991). It has been suggested (by Grout, A1947, and Pirrotta, *Li due Orfei*) that either the term *opera scenica* or the term *opera regia* (the latter meaning a drama with royal protagonists and a happy ending, a term applied to various *commedia dell'arte* scenarios as well as to Monteverdi's *L'incoronazione di Poppea* of 1643) might be the origin of the usage that defines 'opera' as a specifically musico-dramatic work. In the second third of the 17th century, however, *dramma per musica* became the normal term for opera, although in England the word 'opera' was used in this way as early as the 1650s to mean a dramatic work set to music (G. Strahle: *An Early Music Dictionary: Musical Terms from British Sources, 1500–1740*, Cambridge, 1995; John Evelyn used the term in 1644). Nevertheless, the use of the word 'opera' with this meaning seems to have developed only gradually; it became widespread much later than the invention and early development of the genre.

II. Origins

1. Background, precursors. 2. Immediate origins.

1. BACKGROUND, PRECURSORS. Music was inserted into plays as early as ancient Greek times. Choral songs, performed on occasion to the accompaniment of mimetic dancing, served to divide the play into sections and commented on the action in ancient Greek tragedy and comedy. During the 16th century, when Greek drama came to serve as a model for certain aspects of musical theatre, scholars debated the possibility that the plays were sung from beginning to end, a speculation long since abandoned, although it seems probable that some portions of Greek plays other than the choral interludes may also have been sung or at least declaimed musically, by soloists or ensembles of singers. The tradition of including music as an integral part of theatrical activities continued and even expanded in Roman times. With the destruction of the Roman theatres in the 6th century, however, all trace of official theatrical activity, musical or otherwise, disappeared from the archival records. Professional entertainers – *mimi*, *histriones*, *joculatores* and the like – continued to perform plays and skits which combined music with acting during the early Middle Ages, though there is only fragmentary evidence of this.

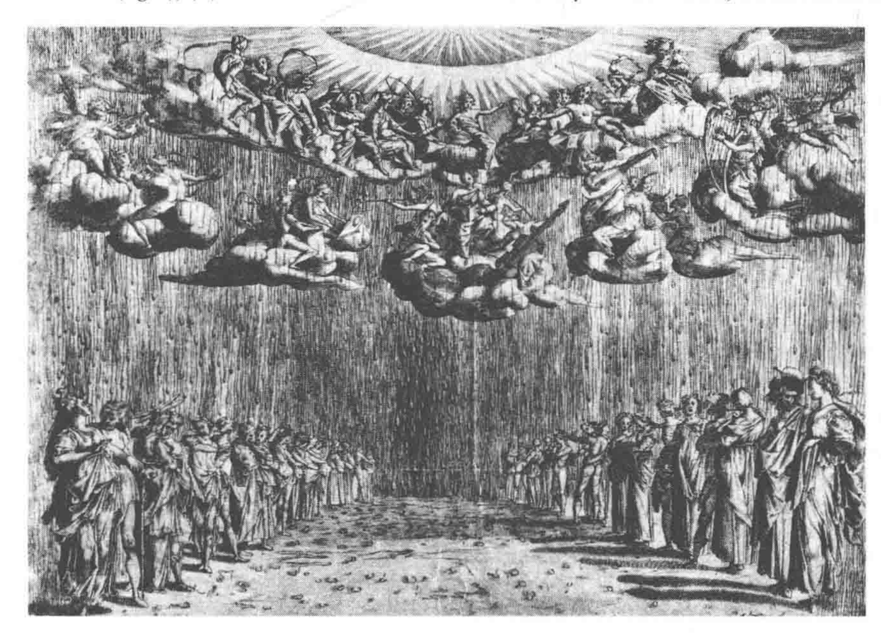
A vast corpus of medieval drama with music survives. It can be roughly divided into two kinds: so-called liturgical drama (*see* MEDIEVAL DRAMA), and vernacular plays with incidental music. Some parts of the sacred service came to be dramatized in order to make the events depicted – and especially the Resurrection of Christ, his Nativity, and the events leading up to it – more vivid and immediate. These liturgical and paraliturgical dramas, whether performed in church as part of a service or somewhere else, were sung in chant from beginning to end. For this reason they have been called the first music dramas, though it should be stressed that the various repertories of religious dialogues, ceremonies and plays from the Middle Ages are far from having common origins or a single continuous history.

Similarly diverse in origin, destination and nature are the various sorts of play in the vernacular that survive from as early as the 13th century, though most copiously from the 15th and 16th centuries. On the one hand, vast medieval mystery and morality plays that often lasted several days were organized by towns for the purposes of both religious celebration and commercial gain. On the other hand, during the 15th and 16th centuries, troupes of professional actors, members of various guilds, and even amateurs performed a more modest repertory of comedies and short plays for a variety of occasions in many countries of western Europe. Both the religious plays and the shorter comedies made use of music as an incidental part of the action. Indeed, this use of music is one of the few things both kinds of play have in common. Only rarely did music play a larger role in vernacular drama. Adam de la Halle's *Jeu de Robin et Marion*, for example, written during the 1280s, is an exception in incorporating so many melodies (most of them presumably pre-existing) into its action.

None of these early musical-dramatic activities seems to have been connected historically. No single grand narrative can be written to link medieval drama to the history of 16th-century Italian comedy and tragedy, let alone to the events that led to the invention of opera in the early 17th century. The history of Italian upper-class theatre in the Renaissance should probably begin with the series of classical plays performed at the Ferrarese court in the late 15th and early 16th centuries, and especially the performances of comedies by Plautus and Terence that became models for many of the erudite written comedies during the century. These courtly performances of classical plays were commissioned by the duke and acted by the courtiers themselves. Later in the century, erudite neo-classical comedies came to be performed by amateurs, by members of the learned academies that flourished during the century, or even by those professional troupes of actors who were better known for their ability to improvise comedies, the so-called *commedie dell'arte* (*see* COMMEDIA DELL'ARTE).

Learned comedy was, of course, not the only genre cultivated in Italy during the 15th and 16th centuries. *Sacre rappresentazioni*, church pageants enlivened with music (much of it related to *laude*), flourished; they may even have had an important influence on the establishment of the pastoral as a genre, or on the idea of vernacular drama with music, but those connections have yet to be solidly established. A repertory of rustic plays featuring peasants and other members of the lower classes also came to be written and performed. Eventually, too, the genre of tragedy was cultivated.

Some exceptional plays did not fit comfortably within any of the principal genres. Angelo Poliziano's *Orfeo*, performed at the court in Mantua about 1480, was such an exception. Poliziano called it a *favola*. Music played a central part. None of it survives, probably because it was not 'learned' written music but belonged rather to the tradition of improvised or semi-improvised music cultivated by Italian poet-musicians in the 15th century. One such poet-musician, Baccio Ugolini, played the role of Orpheus and accompanied himself on the 'lira', almost certainly the *lira da braccio*. In addition to Ugolini's solo sections, there were several choruses. It has been argued persuasively that there is some connection between Ugolini's performance and the philosopher Marsilio



Ficino's Orphic singing to the lyre, if not between Ficino's ideas and Poliziano's play (Tomlinson, B1988). In any case, Poliziano's *Orfeo* was an important landmark in the pre-history of opera, not so much for its form or its influence as for its symbolic significance as a highly musical play outside the Aristotelian genres (it was neither tragedy nor comedy) that dealt with the power of music in a classical setting.

2. IMMEDIATE ORIGINS. The traditional view of the origins of opera – that it developed directly from discussions in the 1570s led by Count Giovanni de' Bardi of Florence and his group of friends who constituted an informal academy known as the Camerata, and from later discussions in the circle around Jacopo Corsi – remains the best narrative of the events leading directly to the first operas: Rinuccini's *Dafne* of 1598 with music by Jacopo Peri and Jacopo Corsi, Rinuccini's *Euridice* of 1600, set by Peri and by Giulio Caccini, and Gabriello Chiabrera's *Il rapimento di Cefalo* of 1600, set by Caccini. (Emilio de' Cavalieri's *Rappresentatione di Anima, et di Corpo* of 1600 should also be included in this group of early dramatic works, even though it was performed in Rome and by virtue of its subject matter is regarded as the first example of oratorio.) Among the many topics discussed by Bardi and his friends, music occupied an important place, and specifically the nature of ancient Greek music and the source of its emotive power. Moreover, various experiments in writing an appropriately dramatic music were made in Florence at the end of the century, most notably Vincenzo Galilei's lost settings of the Lamentations for Holy Week and a scene from Dante, and Laura Guidiccioni's three pastorals set to music, also lost, by Emilio de' Cavalieri.

Nevertheless, a full account of how opera came into existence and how it came to take precisely the form it did needs to consider a number of other 16th-century developments, among them: (1) the history of music in erudite comedy, and especially the nature and role of the *intermedi*, the musical compositions, sometimes sung to the accompaniment of stage action or dancing, that closed each act (fig.1); (2) the nature of music in 16th-century tragedies, and especially of the choruses that divided the scenes; (3) the debate about genres that engrossed literary circles in 16th-century Italy, and especially the debate about the nature of the pastoral, since pastoral eclogues served as a principal model (perhaps the principal model) for the earliest operas; and (4) the nature of the other kinds of music written for staged or semi-staged presentation at courts, academies, civic celebrations and the like – shorter staged scenes and dialogues that have no agreed-upon generic designation, although they were widespread in 16th-century Italy. In addition, we should take into account not only the activities of court musicians and singers, and those employed as musicians to members of the highest reaches of society, but also *commedia dell'arte* players who fulfilled an important though not as yet completely understood function in the history of Italian musical theatre.

Aside from the few songs introduced naturalistically into the plots of various plays, music in 16th-century erudite comedy consisted mainly of madrigals (or in some cases instrumental music), which closed each act. At some performances the musicians were hidden behind the stage, but more often they appeared on stage to sing and sometimes to dance. In many cases, these *intermedi* did nothing more than mark the passing of time, as in Verdelot's madrigals used as *intermedi* for Machiavelli's *La Mandragola* and *La Clizia*, one of the very few sets of normal madrigalesque *intermedi* to survive (some of the same music served for both plays). In many cases, the *intermedi* madrigals may not have been written specifically for that purpose (or at least not for particular plays or performances); it sufficed that the texts dealt with approximately the right subject matter. There seems not to have been a particular theatrical style that distinguished these madrigals from others, but it is difficult to be precise about this, since so little music survives for the texts that appear in many play books.

For great occasions, and especially weddings within the Medici family in Florence, more elaborate *intermedi* were staged between the acts of a play. In these courtly *intermedi*, several musical compositions were performed

1. 'Descent of Rhythm and Harmony', the sixth intermedio in the performance of Bargagli's comedy 'La pellegrina', Florence, 1589: engraving by F. Succhielli after the design by Bernardo Buontalenti, 1592

between the acts, and they were accompanied by stage action, including elaborate machines and dancing. Detailed descriptions of some of these grand occasions were published, and at least two sets of partbooks include the music composed especially for the events: those commemorating the wedding in 1539 of Cosimo I de' Medici with Eleonora of Toledo, and those commemorating the wedding in 1589 of Ferdinando I de' Medici with Christine of Lorraine (see fig.1). Courtly *intermedi* did not have plots, but many of them were centred on a common theme, often pastoral or mythological in character. Grand courtly *intermedi* were the most impressive examples of musical theatre of the 16th century.

The most famous and probably the most elaborate *intermedi* of the entire century were those organized for the Medici wedding of 1589, performed between the acts of Girolamo Bargagli's comedy *La pellegrina*. They were devised by Count de' Bardi around the theme of the power of music in the ancient world (the subject of many discussions of the Camerata), directed by Cavalieri, and composed by Peri, Caccini, Marenzio and other composers of the Medici circle. The 1589 performance was a seminal event for the history of musical theatre, even though the music itself did not differ in character very much from regular madrigals or lighter Italian secular forms. The six *intermedi* were sung throughout, mostly by soloists (including Peri and Caccini), and the third of them, treating the story of Apollo and the python, is a direct precursor of the first opera, *Dafne*, a decade later. But the music of 1589 does not represent any advance towards an operatic style, that is, a kind of music appropriate for setting dramatic dialogue.

Whereas the *intermedi* have been well studied and performed, music for 16th-century tragedies is much less well known, at least partly because so little of it survives, and partly because the surviving music, notably Andrea Gabrieli's music for *Edipo tiranno* (Orsatto Giustiniani's adaptation of the *Oedipus* of Sophocles), which opened the Teatro Olimpico in Vicenza in 1585, seems so unimpressive. Virtually every 16th-century tragedy includes long choruses to divide the action, and 16th-century commentators seem to make a distinction between these sorts of chorus and *intermedi*. To judge from Gabrieli's example, choruses for tragedies were set to a music simple enough to allow the words to be heard easily by the audience. Producers and composers devised various solutions to the problem of an appropriate music for tragedy (for example Norton and Sackville's *Gorboduc*, produced in London in 1562), and in many cases may have organized music indistinguishable from that appropriate for *intermedi*.

The role of music in tragedy, comedy and pastoral (the three principal dramatic genres of the late 16th century) was discussed by a number of writers on dramatic theory and practice in the 16th and 17th centuries, notably Leone de' Sommi (B1556), Angelo Ingegneri (B1598), the anonymous author of *Il corago* (B*c*1630) and G.B. Doni (B1630). Sommi and Ingegneri wrote mostly about *intermedi* and tragic choruses with some consideration of incidental music, *Il corago* and Doni about operatic works. Whereas the author of *Il corago* wished to offer advice about how best to compose and produce opera, Doni, as an antiquarian concerned about the nature of music in ancient Greek and Roman theatre, criticized the new genre on the grounds (among other things) of monotony and lack of verisimilitude and advocated instead a judicious mixture of speech and song, the song reserved chiefly for monologues and choruses.

Such discussions of dramatic practice took place against a longstanding literary debate about genres, and especially about the propriety of the new mixed genres of tragicomedy and pastoral, unknown to Aristotle and hence suspect in the eyes of 16th-century intellectuals, debates chronicled in Weinberg's magisterial study of literary criticism in the Italian Renaissance (B1961). The new pastoral drama, including such famous literary landmarks as Agostino Beccari's *Il sacrificio: favola pastorale* (1555), Tasso's *Aminta: favola boscareccia* (1573) and Guarini's *Il pastor fido: tragicomedia pastorale* (written *c*1580–85), made use of an unusually large amount of music. *Il sacrificio*, for example, included a scene in which priests chanted in a kind of recitative and were answered by a chorus (only the vocal part of a fragment of the music, by Alfonso dalla Viola, survives); and *Il pastor fido* included a famous blind-man's-buff scene (the so-called 'Giuoco della cieca') with singing and dancing.

These plays are important precursors of opera, since discussions about them overlapped and intersected with the discussions that led to the first operas. Certainly the first operas came about partly as a result of debate about the kind of music most appropriate for the pastoral genre. The pastoral plays like those listed above did not, however, serve as models for the earliest operatic librettos. The first operas, instead, seem to have been modelled on the much shorter pastoral eclogues, of 500–700 verses, which put into dramatic (and usually amorous) conflict shepherds and shepherdesses, nymphs and satyrs and gods and goddesses. Most eclogues are quite static dramatically and evidently derive from the long tradition of courtly entertainment. In truth, though, the study of the literary climate in Italy in the late 16th century, and of genres and debates about genre, has hardly been exhausted, especially as these questions relate to music and musicians.

The staged entertainments that had enlivened court life (and also academic and civic life) for centuries provided yet another contributing element to the diverse mixture of traditions and genres that established the character of early opera. *Mascherate* and *moresche* already had a venerable history by the second half of the 16th century. Entertainments in which masked singers and dancers interrupted a banquet or a ball are described by various chroniclers from at least the 14th century. In the late 16th century, short tableaux were sometimes offered as entertainment in upper-class society. They are called by a variety of names (including *morescha* and *mascherata* but also *favola pastorale*, *favola*, *ballo* or simply *fiesta*, among others); there is no generic descriptive term for such entertainments. Madrigal comedies, for example, surely belong in this category, especially since it has been shown (by M. Farahat, *EMH*, x, 1991, pp.123–43) that some of these cycles of polyphonic madrigals, canzonettas and villanellas were actually staged in private rooms. (Many madrigal comedies include characters and dramatic situations derived from *commedia dell'arte*; most of them were written for performance in academies.) More squarely in the tradition of courtly entertainments, though, were the three scenes by Laura Guidiccioni, including the blind-man's-buff scene from *Il pastor fido*, set to music, now lost, by Cavalieri, performed in Florence in the 1590s; or the shorter dramatic works of Monteverdi

like *Il ballo delle ingrate, Tirsi e Clori* and the *Combattimento di Tancredi e Clorinda*.

Opera can thus be seen as a genre that grew out of literary discussion in high society. But another tradition that went into making opera, that of the *commedia dell'arte*, should not be excluded from consideration (as Pirrotta, *Li due Orfei*, has pointed out). During the second half of the 16th century, several professional acting troupes toured Italy, performing not only their own special repertory of improvised or semi-improvised plays with stock characters but also written comedies and other kinds of play. Although scholars have been inclined to characterize *commedia dell'arte* players as only semi-literate artisans, the truth is that many of the actors were highly educated, highly literate and highly musical. Isabella Andreini, for example, the leading lady of the troupe called I Gelosi, was a poet, author of a pastoral eclogue, member of an academy and an accomplished linguist and musician; and Monteverdi's first Ariadne in his mostly lost opera *Arianna* (1608) was an actor. Moreover, *commedia dell'arte* plays influenced the form and style of some opera librettos towards the middle of the 17th century (Bianconi and Walker, C(i)1975), and troupes of professional actors sometimes performed opera. Closer investigation is needed of the musical orientation of the *commedia dell'arte* players in general and their connection with opera in particular.

There was a vast amount of dramatic music heard in Italy in the 16th century, and a large literature of debate and discussion about it. All this activity contributed to musicians' ideas of what an appropriate music for the theatre should be. The crucial change from courtly entertainment to opera came about when a kind of music appropriate for dramatic dialogue was invented, by Caccini, Cavalieri, Vincenzo Galilei or Peri (all of them claimed credit). The overall shape of the earliest operas, *Dafne* and the two *Euridice* settings (as well as Monteverdi's *Orfeo*), was deeply influenced by earlier traditions, at least in that scene divisions were closed off by large *intermedi* choruses; and their subject matter was determined after extensive literary debate about genre, ancient history and the nature of music's power.

III. Early opera, 1600–90

Opera in the 17th century developed in three phases. The first, humanist court opera (1600–35), closely linked to Italian Renaissance traditions of court entertainment, was played out in the aristocratic palaces of Florence, Mantua and Rome. The second, *dramma per musica* (1637–*c*1680), defined by the generic subtitle that became current in librettos at mid-century, was staged in the public theatres of Venice. In the third, European spectacle (1650–90), which overlapped the second and involved the dissemination of the new genre throughout Italy and across the Alps, *dramma per musica* adapted to local political and social conditions, in theatres both public and private.

Contemporary critical commentary effectively articulated the aesthetic principles of the art and helps to distinguish the various phases of its development. Writing at the end of the first phase, G.B. Doni (*Trattato della musica scenica*, B1630) and especially the anonymous author of *Il corago* (B*c*1630) explored the basic issue of verisimilitude raised by the requirement of speaking in song ('recitar cantando') and offered guidelines for the choice of appropriate subject matter (pastoral), characters (gods, musicians) and poetic style (variety of metres, *versi sciolti*). The Jesuit priest G.D. Ottonelli (*Cristiana moderazione del teatro*, 1652) distinguished the different phases by their patronage and implied function: the aristocratic phase 'performed in the palaces of great princes and other secular or ecclesiastical lords . . . or produced sometimes by certain gentlemen or talented citizens or learned academicians' and the 'commercial productions of a musical and dramatic nature put on by professional musicians', who performed in public theatres. Finally, the Dalmatian canon Cristoforo Ivanovich, in *Memorie teatrali di Venezia* (1681), a treatise devoted exclusively to the development of public opera in Venice, epitomized its relation to court opera in socio-economic terms: 'Venetian theatres are in no way inferior to those supported by princes, except that in those enjoyment depends on the prince's generosity, whereas in these it is a matter of business'.

1. Humanist court opera.

(i) Florence. Humanist opera emerged around 1600 in Florence as the culmination of a series of spectacular entertainments designed to celebrate the dynastic image of the Medici, most famously the wedding *intermedi* of 1589 (fig.1), in which almost all the figures associated with the first operas were involved: Giovanni de' Bardi as stage director, who organized the entertainment and composed one chorus, Emilio de' Cavalieri as musical director and choreographer, who wrote some of the music, Ottavio Rinuccini, author of most of the text, and the composers Jacopo Peri and Giulio Caccini, who sang in the production and contributed one number apiece. These were among the participants in the academic discussions establishing the aesthetic premises of the new art. Beginning in the 1560s in the Accademia degli Alterati and continuing for several decades, first in Bardi's so-called Camerata and then at the palace of Jacopo Corsi, their discussions investigated the nature of ancient tragedy and the contribution of music to its legendary effect. Their aim was to re-create a modern, wholly sung drama that was comparable in power and intensity.

The *Euridice* of Peri and Rinuccini, performed in the Pitti Palace in 1600 as part of the festivities celebrating the marriage of Maria de' Medici and Henri IV, stands as the first monument of operatic history (though Caccini's setting of the same libretto, part of which was incorporated in the performance, was in fact published first). Peri and Rinuccini had actually collaborated with Corsi some years earlier on a similar work, *Dafne*, which was designed, in Rinuccini's words, 'to show what our new music could do'. Evidently begun as early as 1594, but not performed until 1598, this *Dafne* was never published, and as a result only a few excerpts have survived; but one of them exemplifies the recitative style that was Peri's major contribution to the developing genre. The publication of Caccini's and Peri's scores of *Euridice* within a couple of months in 1600, along with that of a musical drama by Cavalieri, *Rappresentatione di Anima, et di Corpo*, the prefaces of all three claiming priority, indicates the intensity of the rivalry during these years.

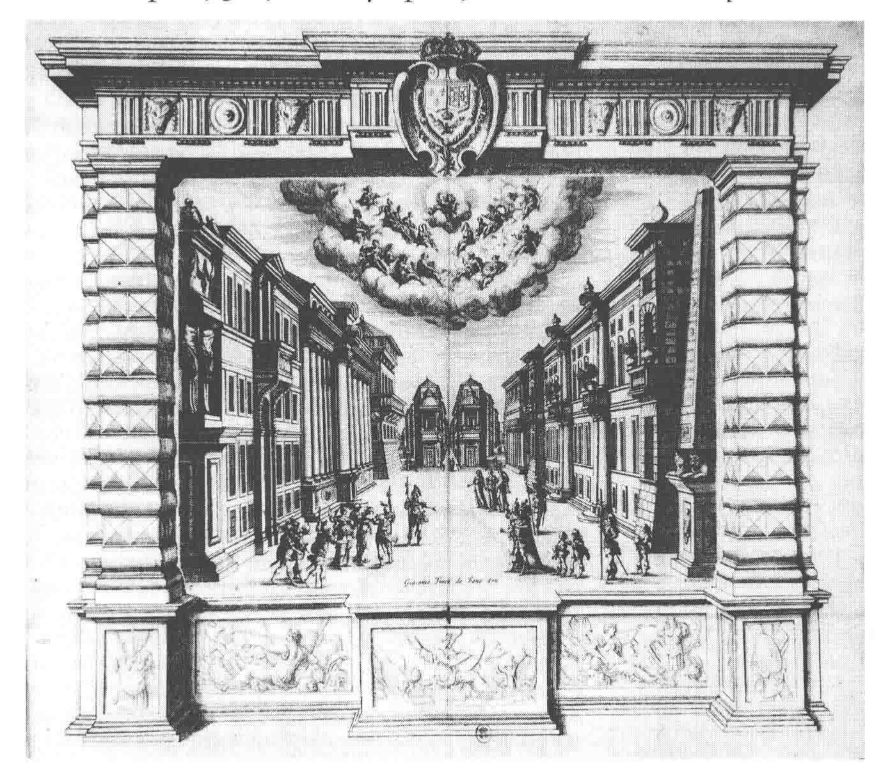
Both *Dafne* and *Euridice*, called *favole*, are Ovidian pastorals, ideally suited to demonstrating the power of the new music. Beyond portraying a world and an age in which 'music was natural and speech almost poetic' (Doni), each features a mythic musician as hero: for both Apollo and his son, Orpheus, singing is a natural means of expression.

The most important stylistic innovation of *Euridice* was recitative: a 'harmony surpassing that of ordinary speech but falling so far below the melody of song as to take an intermediate form', in Peri's famous description. Flexible enough to follow the form of the text as well as its expression, the *stile recitativo* allowed the characters to seem as if they were speaking naturally. Rinuccini's poetry inspired the *stile recitativo*, with its almost prosaic *versi sciolti*, interrupted on occasion by more highly structured passages, sometimes strophic, in a variety of poetic metres. Such passages, mostly for chorus but also in the allegorical prologue for Tragedy, became the poetic basis of the opera aria.

Within the remarkable expressive range of Peri's recitative – from Daphne's chilling narrative account of Eurydice's death to Orpheus's poignant lament and solemn formal prayer – dramatic verisimilitude is enhanced by the close adherence of the music to the emotional contours of Rinuccini's text. All three instances became emblematic for the operas that followed.

(ii) Mantua. Operas continued to be presented in Florence over the course of the next several decades, interspersed with *intermedi*, ballets and tournaments. But the real centre of operatic activity shifted, albeit briefly, to Mantua, long a musical rival of Medici Florence. Sponsored by the reigning Gonzaga duke, Vincenzo, another operatic rendition of the Orpheus myth was performed in his palace in 1607 before the Accademia degli Invaghiti. This *Orfeo*, by the court composer Claudio Monteverdi, on a libretto by the court secretary Alessandro Striggio, was clearly inspired by its Florentine predecessor. It emphasizes the same dramatic moments – including the narration of Eurydice's death and Orpheus's subsequent lament and prayer – but Monteverdi's music embraces a far wider affective vocabulary than Peri's. Recitative is interspersed much more liberally with song and dance. *Orfeo* also places much greater emphasis on formal elements: strophes, refrains and larger symmetrical structures, extending to entire acts and even the opera as a whole, create a sense of musical coherence and shape missing in the earlier score. And the famously elaborate orchestra, with its paired violins, harps and other instruments and rich continuo – more akin to that of the Florentine *intermedi* than Peri's opera – plays a crucial role in creating musical variety.

Two further operatic landmarks appeared in Mantua in 1608, in conjunction with the wedding of Francesco Gonzaga and Marguerite of Savoy: Marco da Gagliano's setting of a revision of Rinuccini's *Dafne* (published 1608) and Monteverdi's *Arianna* on a new Rinuccini libretto – the first musical 'tragedia', so called because its principal characters are of royal birth and their actions are politically motivated (*PirrottaDO*). The only surviving music is Ariadne's long recitative lament on the departure of Theseus, reported to have moved the audience to tears; Monteverdi's own publication of this music in various forms, the many contemporary manuscript copies and numerous imitations in subsequent operas attest its power and significance. In its ideal meshing of textual and musical rhetoric, it represents the acme of the recitative style.



(iii) Rome. Although operas, along with other kinds of musical entertainment, continued to be performed in Mantua during the next decades, the centre of operatic activity shifted once again, this time to Rome. Drawing on more varied sources of patronage – aristocratic families and religious organizations as well as the papacy – opera developed very differently here. These differences are already evident in Cavalieri's *Rappresentatione di Anima, et di Corpo* (1600), credited with being the first wholly sung drama in Rome. A moralizing allegory performed during Lent at the oratory of S Maria in Vallicella, it is more relevant to the history of the oratorio than to that of opera.

Sung dramas of various kinds, sharing little with one another aside from a moralizing ethos and a solo style of minimal expressive power, continued to appear sporadically during the next two decades in a variety of venues, secular and religious. Of greatest historical significance was the 'favola boschereccia' *La catena d'Adone* (1626), Domenico Mazzocchi's setting of a libretto by Ottavio Tronsarelli based on Marino's sensational epic of 1923, *Adone*. Purporting to illustrate the sufferings of the human soul when it wanders from God, Mazzocchi's only opera was published with a preface in which, addressing the problems raised by the stylistic dichotomy inherent in early opera, the composer acknowledges the tediousness of recitative and introduces the concept of 'mezz'arie' as an antidote. Accordingly, the score is filled with brief lyrical passages, neither aria nor recitative, that were later called arioso.

The election of Maffeo Barberini to the papacy in 1623 as Urban VIII brought new regularity to operatic activities, promoted by the papal nephews, Francesco, Taddeo and later Antonio Barberini, and their colleague Giulio Rospigliosi, the future Pope Clement IX. They fostered a series of operatic productions for Carnival at their palaces, eventually in the huge (4000-seats, it is claimed) theatre within the Palazzo alle Quattro Fontane. All the librettos were by Rospigliosi, drawing either from lives of the saints, such as *Sant'Alessio* by Stefano Landi (1631 or 1632, published 1634), or from Renaissance literary sources: *Erminia sul Giordano*, by Michelangelo Rossi, from Tasso, (1633, published 1637); Virgilio Mazzocchi and Marco Marazzoli's *Chi soffre speri*, from Boccaccio (1637); and Luigi Rossi's *Il palazzo incantato*, from Ariosto (1642). The Barberini-Rospigliosi operas were lavish spectacles with political and dynastic intent, glorifying Rome and their patrons.

2. 'Dramma per musica'. The death of Urban VIII in 1644 brought the spectacular Barberini era to a close, and with it the effective end of humanist court opera. Nearly a decade earlier, a new kind of opera had begun to emerge in Venice.

Venetian opera reflected the distinctive traditions and oligarchical structure of the Most Serene Republic. Performed during Carnival in theatres owned by patrician families competing for prestige – the Tron, Grimani, Vendramin and Giustinian – before a ticket-buying public, opera in Venice was a business, as Ivanovich noted: a big business. Theatre owners contracted with impresarios or production companies that supplied operas or commissioned them; they also provided or hired musicians and

other workers. Initially librettists and/or composers themselves acted as impresarios (Ferrari, Cavalli, Giovanni Faustini), but eventually the role was filled by entrepreneurs who devoted their full time to the increasingly complex negotiations involved in opera production (Marco Faustini, Francesco Santurini). The continuity and frequency of performance promoted by regular demand and dependable financial backing ensured the institutionalization that characterizes opera today.

What started as an experiment in 1637 with a performance of *Andromeda* at the Teatro S Cassiano by a Rome-based itinerant troupe, directed by Benedetto Ferrari, blossomed within a few short years into a full-blown industry. Both foreign and local talent were exploited to satisfy increasing demand for librettists, composers, stage designers and performers. Monteverdi, lured out of operatic retirement, produced his three last masterpieces, *Il ritorno d'Ulisse* (1640), *Le nozze d'Enea e Lavinia* (1641, lost) and *L'incoronazione di Poppea* (1643, with the collaboration of several other composers), for Venetian theatres. His S Marco colleague Francesco Cavalli became the most prolific composer of the period, producing 28 operas over a 30-year career. By 1641, audiences could see multiple performances of as many as eight different operas during a season that lasted approximately six weeks in four different theatres. (There were nine by the end of the century, although the number of open theatres varied from two or three during the 1650s and 60s to five or six later.)

One important theatre not under patrician family control, the Novissimo, was specially built for a group of noble academicians, the Incogniti (who included the important early librettists G.F. Busenello and Giulio Strozzi), whose public-relations efforts in pamphlets and libretto prefaces were fundamental to the establishment of the new genre. Their inaugural effort, *La finta pazza* (Strozzi and Francesco Sacrati), designed by the architect-turned-scenographer Giacomo Torelli, and featuring the Roman diva Anna Renzi, became the most famous opera of the period (fig.2). As the most frequent Venetian export, it epitomized *dramma per musica* throughout Italy.

Opera achieved commercial viability through a combination of popular appeal and efficiency of production. Subject matter drawn from topics relevant to Venetian audiences ranged from the legends of Troy (regarded as part of the mythic history of the republic) to the exploits of imperial Roman heroes that could serve as exemplars for modern Venetians at war with the Turk. Librettos included pointed references to Venetian social customs – courtesans, gondoliers, even public opera itself – and asides addressed directly to the audience that bridged the gap between fictional and real worlds. And the city itself was explicitly praised in prologues and depicted in scenic backdrops.

Orchestras were small (normally just strings and continuo), roles were doubled, the chorus was eschewed and a broad range of variable conventions facilitated the mass production of operas. Operatic structure was standardized at a prologue and three acts. Plots, whether drawn from myth, epic or history or newly invented, focussed on two pairs of noble lovers, attended by various comic servants, who are separated and then reunited. Recitative in *versi sciolti* was interspersed with closed-form arias in a single metre and/or with a regular rhyme scheme. Musico-dramatic scene types included the sleep scene with lullaby, the mad scene, the incantation (in *versi sdruccioli*) and the lament (on a descending tetrachord bass); vocal types included castrato heroes, bass fathers and *travesti* nurses.

Essentially established through the collaboration of Cavalli and his first regular librettist, Giovanni Faustini,

which produced ten operas in as many years (1642–52), these conventions were easily adapted by other composers and librettists and remained in place to the end of the century. Certain individuals stand out for their accomplished treatment or extension of the conventions: the librettists G.A. Cicognini, Nicolò Minato, Aurelio Aureli and Matteo Noris; the composers Antonio Cesti, Giovanni Boretti, Antonio Sartorio and Giovanni Legrenzi. Nevertheless, the conventions ensured a continuity of style that minimized differences between particular composers and librettists.

Changes, as the century progressed, reflected developing audience expectations. Singers assumed increasing prominence (reflected by the rise in their salaries in comparison with those of composers). Distinctions between recitative and aria, blurred for expressive reasons in Monteverdi's and Cavalli's works, became clearer. Arias increased in length as well as number from around a dozen in the 1640s to more than 60 in the 1670s, with the musical form *ABA* (eventually developing into the da capo aria) gradually superseding *ABB*. Increasingly, plots became filled with improbable occurrences as sources were stretched to the point where nothing but the original title survived. More and more, serious and comic elements became intermingled. These developments were condemned by contemporary critics as pandering to the lower elements in the audience, a trend hastened in 1674 by a radical reduction in ticket prices introduced at one of the theatres (the S moisè), which increased business but reduced the funds available for productions.

Besides forcing competing theatres to follow suit, this move inspired the opening of two new theatres, one of which, S Giovanni Grisostomo, surpassed all the others in magnificence. Since its owners, the Grimani family, were firmly opposed to the newly popular style, it alone maintained higher prices – and spectacular scenography – and it became a symbol of the restoration of decorum. Towards the end of the century it became a Venetian outpost of the Roman Accademia degli Arcadi, a forum for operatic reform.

3. European spectacle.

(i) Beyond Venice: the Italian peninsula. Once established in Venice, opera began to be exported beyond the lagoon – first by Ferrari's itinerant troupe, then by others (Febiarmonici, Accademici Discordati). *Dramma per musica* became the dominant form of theatrical entertainment throughout Italy and even north of the Alps, though delayed or modified, in some cities, by particular local traditions. *La finta pazza* was heard in nearly a dozen cities, including Paris, during the period 1644–52 (see fig.2). After the middle of the century *Giasone* (Cicognini, Cavalli) saw 20 or more different productions, the latest in 1690.

The conventionalized but open structure of the model offered ample scope for modification to suit different audiences and performing conditions. In Medici Florence, the influential librettist G.A. Moniglia adapted the Venetian model to traditional courtly functions: Cavalli's *Hipermestra* celebrated a royal birth in 1658 (fig.3), Jacopo Melani's *Ercole in Tebe* a wedding in 1661. Both were performed at the Teatro della Pergola under the auspices of the Medici-sponsored Accademia degli Immobili, which concurrently presented a series of indigenous comic operas (also setting Moniglia librettos) that exploited local customs and dialect. Meanwhile another,

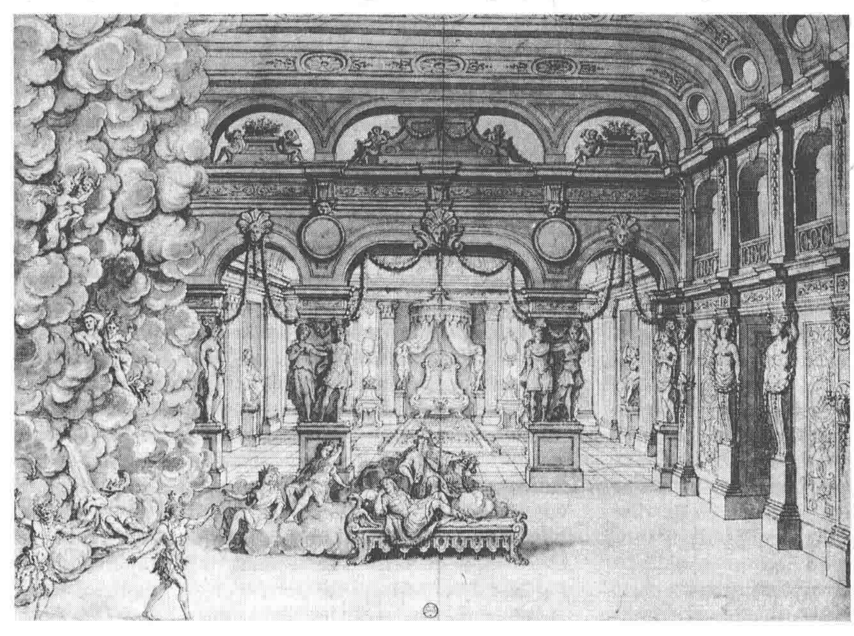
more bourgeois academy, the Sorgenti, hosted a series of Venetian imports at its own commercial theatre, the Cocomero.

In Naples, beginning in 1651, Venetian imports were adapted to celebrate the Spanish viceroy, both at the palace theatre, S Carlo, and at S Bartolomeo, a public theatre opened in 1654. In Rome, *dramma per musica* never really took hold. Except for the brief period 1671–4, when a series of modified Venetian imports were staged at the Tordinona, a public opera house licensed under Pope Clement IX (Rospigliosi) and patronized by Queen Christina, operas continued to be produced privately, and intermittently, under the sponsorship of various noble families. They fall into two distinct categories. The first, derived from contemporary Spanish cloak-and-sword comedy, included two in the 1650s by A.M. Abbatini and Marco Marazzoli on Rospigliosi librettos, and several in the 1670s and 80s by Bernardo Pasquini and the young Alessandro Scarlatti. The second, in a simplified style, was based on pastoral subjects, representing the nascent Arcadian movement (including various works by Scarlatti,

4. Design by Filippo Juvarra (a forest sacred to Apollo, with throne and temple) for Alessandro Scarlatti's 'Il Ciro', Palazzo della Cancelleria, Rome, Carnival 1712: pen and brown ink with wash (GB-Lv 8426.57, f.118r)



on librettos by Antonio Capece, G.D. de Totis, Silvio Stampiglia and Cardinal Ottoboni): this genre soon made itself felt in Venice as well.

The impact of *dramma per musica* north of the Alps, whether imported, imitated, adapted or rejected and replaced, depended on the social structures of the receiving country. Developments in France can be regarded as a reaction against it: a brief period of imports was followed by strenuous efforts to replace it with a national style which, however, borrowed elements from it. German-speaking countries hosted it longest, developing an indigenous tradition quite late. In contrast, England and Spain remained virtually untouched by *dramma per musica*, insulated from its influence by their own distinctive traditions of theatrical music.

(ii) France. As part of the italianization of the French court promoted by Cardinal Mazarin, the first operas in Paris were Italian imports (six in the years 1645–62), either designed or modified to suit French taste. Thus Paris was depicted in the scenic backdrop of *La finta pazza*, and in Cavalli's *Xerse* (1660) the 'unnatural' castrato hero was recast as a baritone and the three acts were turned into five, interspersed with the elaborate ballets – by the young Lully – traditionally beloved by the French. Two Italian operas written expressly for the French court, Luigi Rossi's *Orfeo* (1647) and Cavalli's *Ercole amante* (1662), featured, in addition to the obligatory ballets, elaborate political prologues and epilogues in praise of the monarch. In the latter, commissioned for the wedding of Louis XIV and the Infanta of Spain, the king himself appeared in several of the ballets, as Pluto, Mars and, of course, the Sun: a vivid instance of patronage made visible.

Following the death of Mazarin, *dramma per musica* was rejected in favour of a national style that represented a synthesis of French traditions and tastes. Nonetheless, the Italian genre left some significant traces, not only the concept of wholly sung drama itself but in conventions such as the *sommeil* (based on the ubiquitous sleep scene; fig.5) and the magnificent large-scale chaconne movements that united singers, players and dancers (based on the musical idea that underpinned the Italian lament).

The development and persistence of a national style of French opera are owed to the specific programme established by royal patronage and the vision and talents of the figure eventually charged with carrying it out. Through the establishment of the Académie Royale de Musique (or Opéra), in 1672 the king granted a monopoly for the production of opera in French to his Florentine-born *surintendant de la musique*, Jean-Baptiste Lully. Lully succeeded in creating a distinctive national opera, following a similar but abortive attempt by Pierre Perrin

5. 'Divertissement du sommeil' (Act 3 scene iv; 'arrivée des songes agréables et funestes') from Lully's tragédie lyrique 'Atys': design by Jean Berain I, pen and ink with wash, for a revival, probably in the 1680s (F-Pn)

6. Juno lobbies Paris for a favourable decision, Act 1 scenes xi–xiv (a courtyard in Paris's palace) of Cesti's 'Il pomo d'oro', Theater auf der Cortina, Vienna, 12 July 1668: engraving by Matthäus Küsel after the design by Ludovico Burnacini

and Robert Cambert, and drawing on his experience as a composer in other theatrical genres, especially *comédies-* and *tragédies-ballets*.

Together with his librettist Philippe Quinault, Lully managed to incorporate the most characteristic elements of earlier genres – elaborate ballets, marvellous scenic transformations ('le merveilleux'), luxuriant divertissements of songs and dances – within a context responsive to the strong traditions of spoken theatre and the French requirement for verisimilitude: the *tragédie lyrique* or, as it was initially called, *tragédie en musique*. Based either on mythology (*Cadmus*, *Atys*; fig.5, and see fig.34 below) or on chivalric legend (*Roland*, *Armide*; see fig.35 below), all 13 of Lully's *tragédies* feature an amorous aristocratic couple disturbed by one or more rivals (which often include a deity), with a parallel plot involving characters of lower rank. They reflect contemporary spoken tragedy in their five-act structure, adherence to the Aristotelian unities (*pace* Boileau and other critics), the preservation of *liaisons de scènes*, the delegation of tragic events to messengers' reports and the use of the chorus for commentary and as participant in the action as well as for decoration. Verisimilitude is maintained through reliance on *récitatif ordinaire* and brief, syllabic continuo *airs* for dialogue, permitting a natural, speech-like declamation of text. More substantial *airs* with orchestral accompaniment expressive of feelings are reserved for soliloquies. Musical contrast and opulence are provided by instrumental movements, various conventional scene types, ballets and, of course, the divertissements – all of this enhanced by Lully's renowned orchestra and the visual marvels provided by the scenographer Carlo Vigaran.

The lengthy season (49 weeks), the frequent performances (at least three a week), the steady supply of new works and repeated revivals of old ones over a period of 15 years assured the continuity of the *tragédie lyrique* well beyond Lully's death in 1687. The publication of Lully's oeuvre, beginning in 1679, essentially established a national repertory and a permanent tradition. His successors, among them Pascal Collasse, Henry Desmarets, André Campra, André-Cardinal Destouches and Marin Marais, relied upon revivals of his works to attract audiences to the opera.

Comparisons between French and Italian opera agitated critics in both countries from the late 17th century onwards. After taking its lead from Italy in the 1640s, France reciprocated by influencing the Arcadian reform of Italian opera in the 1690s.

(iii) The German-speaking lands: Vienna and Hamburg. The *dramma per musica* enjoyed greater longevity and influence in German-speaking lands than anywhere else; in essence, the taste for it inhibited the development of a native tradition. Vienna and Innsbruck were rather like Venetian outposts, where newly created works were literally interchangeable with those produced in Venice itself. In Vienna, under the guidance of Leopold I (1657–1705), the genre was adapted to courtly service, becoming more decorative, elaborate and visibly expensive, with plots designed to allude to the heroic exploits of the ruling dynasty. Under long-term contracts, a stable of Italian composers (including Antonio Cesti, M.A. Ziani, G.F. Sances and Antonio Bertali) and poets (Francesco Sbarra, Nicolò Minato) and the scenographer Ludovico Burnacini supplied between six and ten theatrical entertainments annually, including operas, to celebrate imperial birthdays and namedays and special occasions such as court visits. One of the most elaborate of them was Cesti's *festa teatrale*, *Il pomo d'oro*, on a Sbarra libretto; planned to cap the two-year-long celebration of the emperor's marriage to Margherita, Infanta of Spain, it was finally performed in 1668, over two days (fig.6; *see also* VIENNA, fig.4). Antonio Draghi, librettist (from 1658), composer (from 1662) and superintendent (after 1674), was responsible for more than 170 of these works between 1662 and 1699.

The genre flourished for a briefer period (1654–65) at Innsbruck, under the auspices of the archduke, where an Italian company directed by his *maestro di cappella*, Cesti, produced operas in the specially constructed Venetian-style theatre. This was the first independent opera house in German-speaking lands. Several operas originating in Innsbruck and Vienna were subsequently revived in Venice and became widely known throughout Italy.

Vernacular operas by native composers were few, and most of the scores are lost, famous among them Heinrich Schütz's *Dafne*, setting a translation of the Rinuccini libretto by Martin Opitz (1627). S.T. Staden's *Seelewig* (1644; *see* STADEN, SIGMUND THEOPHIL, fig.2), the first 'German' opera of which the music is extant, is actually more of a moral allegory. J.C. Kerll's *Oronte* (1657) inaugurated the Munich opera house, which, like most German opera houses, was built to perform Italian opera (Munich and Hanover under Agostino Steffani, Dresden under G.A. Bontempi and Carlo Pallavicino).

The significant exception was the Theater am Gänsemarkt in Hamburg, established in 1678 by a group of citizens who invested their capital for the purpose of producing opera in German. As profits depended on income from box rental and ticket sales, operas were staged not seasonally but throughout the year. The house opened with Johann Theile's *Adam und Eva*, based, like many subsequent works, on a biblical story. While most of the librettos were by local poets, some were translations of Venetian texts, set to new music. Like Venice, Hamburg was a prosperous, cosmopolitan and independent commercial centre. It was to become especially important for the development of German opera, with the works of Mattheson, Keiser and Handel.

(iv) England. Both *dramma per musica* and *tragédie lyrique* were known in England. Cavalli's *Erismena*, which survives in a contemporary English translation, may have been performed in London in 1674, and Lully's *Cadmus* was performed in 1686. But wholly sung drama never established a foothold. Factors militating against it include a strong dramatic tradition in which music played no more than an incidental role, and a competing tradition of celebrating royal events with elaborate masques that combined music, dance and scenic spectacle. Both genres provided satisfying musical and dramatic entertainment without raising questions of the propriety of sung dialogue.

Nevertheless, the recitative style made an early appearance in Ben Jonson's masque *Lovers Made Men*, set to music (lost) by Nicholas Lanier (1617), and in William Davenant's *The Siege of Rhodes* (1656; *see* LONDON (i), fig.12), said to be the first English opera, which was set completely to music by a team comprising Henry Lawes, Henry Cooke and Matthew Locke (vocal music), and Charles Coleman and George Hudson (instrumental music). French influence, encouraged by Charles II, eager to re-create the court opera he had experienced during his recent exile in Paris, is evident in the so-called semi-operas of Locke (*Macbeth*, 1664, *The Tempest*, 1674, and *Psyche*, 1675). As in Lully's *comédies-ballets*, music is reserved for magic, ceremonial and spectacle. There is even in one full-scale English *tragédie lyrique*, *Albion and Albanius*, a Dryden libretto set by the French-trained composer Louis Grabu in 1685.

The French style permeates the two most exceptional all-sung works of the period, John Blow's *Venus and Adonis* (*c*1683) and Henry Purcell's *Dido and Aeneas* (1689), his only opera. Though the knowledge of French and Italian opera did not increase the incidence of continuously sung drama, both styles influenced Purcell. Dryden called Purcell's late semi-operas 'our English operas'; his own *King Arthur* (1691) was among them. They contain numerous recitatives, lament arias and ostinatos. Purcell achieved full characterization through music, however, only in *Dido and Aeneas*.

(v) Spain. Despite strong cultural ties with Italy and the presence of a large contingent of Italian theatre men – including Rospigliosi as papal nuncio for 11 years, as well as several Florentine theatrical architects – Italian opera made little headway in Spain. Like England, Spain already had strong indigenous traditions of theatrical music and a vital heritage of spoken theatre which with Calderón and Lope de Vega reached its golden age in this period. Spectacle plays, zarzuelas, semi-operas and *comédias* featuring songs, dances and even some recitative dialogue in a distinctively native style served the same political and social functions as opera in other European courts: the glorification of the monarchy.

Three full-sung operas are known; they were motivated by particular political considerations and performed in the royal palace at Madrid under the patronage of Philip IV. The first, Lope de Vega's *La selva sin amor* (1627), composed by the Italians Filippo Piccinini and Bernardo Monanni, was promoted by a group of Florentine residents at court, as part of a plot to exert Italian influence on Philip IV. The other two, Calderón's *La púrpura de la rosa* and *Celos aun del aire matan* (both probably composed in 1660), reflected a desire to compete with Mazarin in celebrating the peace treaty with France and the coming marriage of the infanta and Louis XIV. But these were anomalies, and of the three works only the music of *Celos aun del aire matan* by Juan Hidalgo has survived. Hidalgo probably also composed *La púrpura de la rosa*.

IV. The 18th century

1. Views of 18th-century opera. 2. Social practice: (i) Institutions and circulation (ii) Genres (iii) Performance and performers (iv) Audiences. 3. Stylistic evolution: (i) Up to *c*1760 (ii) *c*1760–90.

1. VIEWS OF 18TH-CENTURY OPERA. Any attempt at a chronological survey of an art form implies that there is a continuity in that art which outlasts periods. Such a continuity may well be questioned in the case of opera: at the beginning of the 18th century, it was still a form of Italian or French literary theatre recited musically; at the end of the century, it had been transformed into a musical species of art, common to all Europe. It is of course possible to trace an evolutionary connection between the beginning and the end of 18th-century opera, particularly if the account focusses on the history of opera as composition. That historiographical convention, however, imposes an artificial unity on the subject. If 18th-century opera is conceivable as a whole, then it is only as a multivalent concept where the interactions of music, drama, social function and other factors are subject to changing contexts, defying the boundaries of academic disciplines.

The field of reference for a study of 18th-century opera will vary according to how opera is defined. To see it primarily as a musical art involves marginalizing much 18th-century theatre where the musical ingredient consisted only of borrowed songs (French vaudeville comedies, English ballad operas, plays with songs and incidental music); if it is a theatrical art, much unstaged dramatic music must be excluded (cantatas, serenatas, concert arias). The understanding of opera as an exclusively secular genre would rule out the sacred operas of the period (*dramma sacro*); and opera histories that

include independent melodramas (Wieland, Schweitzer) or staged ballets (Starzer/Hilverding, Gluck/Angiolini) do not even require opera to be sung. There is also the question of whether opera is to be regarded as a 'work' (opus) or a practice.

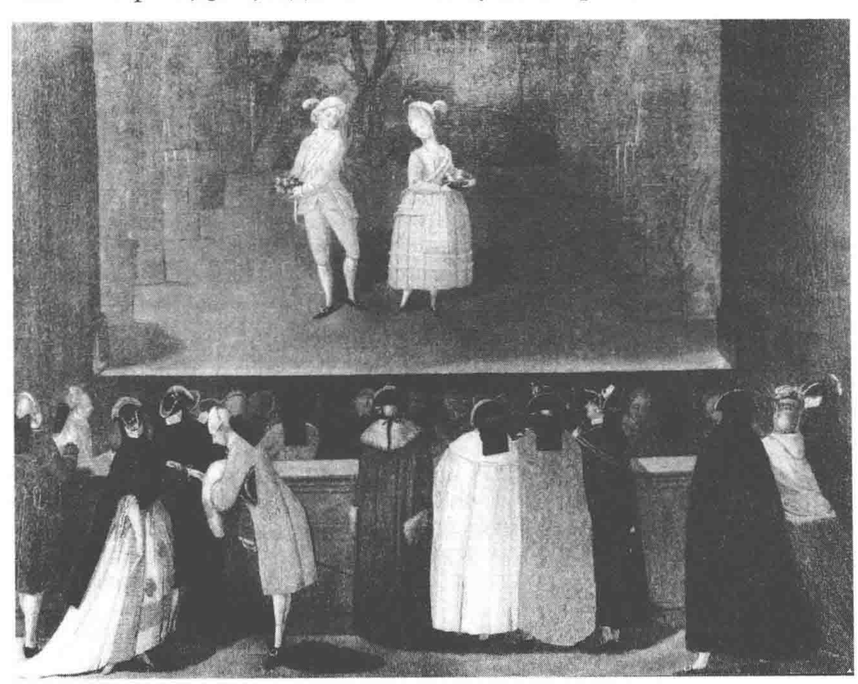
The 18th-century development has tended towards the concept of opera as both a work and a practice that presents 'sung action on stage'. This definition is fragile: when modified to 'singing and acting on stage', it would cover practically any theatrical performance of the time. The term 'opera' itself, widely adopted by the end of the century, originally had alternative meanings (for example a *commedia dell'arte* performance). The names for sub-genres were either literary (*tragédie en musique*, *dramma per musica*, *commedia per musica* and others) or colloquial (*opera buffa*, *opera seria*, *opéra comique* and others). Thus the colloquial term 'opera' seems to have implied the musical ingredient anyway, whereas it had to be specially added to the literary terms ('. . . per musica'). It was this colloquial Italian term that was adopted in most countries, occasionally competing with native terms (Singspiel, zarzuela).

The period under consideration, *c*1690–1790, privileges *opera seria* as a paradigmatic sub-genre, since it formed a relative unity in these 100 years and had an international dissemination typical for this time. From a purely national perspective, or in comic opera, the years 1690–1790 would hardly appear so unified. In French opera, for example, two events described by contemporaries as 'revolutions' were the establishment of full-blown *opéra comique* in the 1750s and the structural changes brought about by Gluck, Piccinni and others from 1774 onwards; works representative of both types remained in the repertory until 1830 and after.

A study of 18th-century opera must take account of other forms of theatre of the time, to help an understanding of operatic music itself (for example in its gestural functions) and to place opera in its literary and theatrical context. The history of literature overlaps most extensively with that of opera; the texts and dramatic contents of opera are important, not least because the genre addresses non-musicians as well as musicians. On the other hand, musical dramaturgy was widely seen as exempt from the rules and aesthetic precepts of the literary theatre, just as musical poetry is often more appreciated when sung than when recited.

In the narratives of cultural history, the 18th century seems to cross a major division or watershed, from whatever standpoint it is viewed: it bridged *ancien régime* and Revolution, Baroque and Classicism, absolutism and Enlightenment, and so forth. Such perceived divisions strongly influence the modern reception of 18th-century opera, for example in the perceived difference between opera before Mozart and after: the former is 'early music', the latter Classical repertory. Some of Gluck's operas belong to the former category in the Anglo-American world but to the latter in continental Europe. Related constructions oppose Baroque opera (the artistic mirror of an imagined courtly environment) to Classical-Romantic opera (a dramatic musical work aspiring to the standards of original authorship). The former type needs restoring, reviving or re-creating, the latter editing, performing and interpreting. These fixed views of cultural history are also implied when opera historians welcome the arrival of 'flesh and blood' in 18th-century opera (for example thanks to Handel, the middle classes, Goldoni or Mozart) or deplore a loss of performative spontaneity in favour of canonical repertories.

The Classical-Romantic aesthetic of music as a self-expressive art, which appears towards 1780 in the critical literature of the European Enlightenment and has dominated 19th- and 20th-century views, was imposed on earlier opera with little regard to the genre's theatrical loyalties. From this perspective, most 18th-century opera appears as a pre-enlightened practice, enslaved by its social functions but also curiously irrational or dreamlike: an authoritarian puppet theatre. Even its traditional task of imitating nature by portraying the affections is thought to have been essentially beyond its reach, not to speak of the challenge of expressing true humanity on stage. This perception, which puts the burden of dramatic expression too exclusively on musical composition, should be contrasted with ideas by which the century understood itself (particularly when it began), with ideas cultivated in areas more in need than in possession of enlightenment and with ideas belonging to the context of theatre rather than that of 'Art'. If this were done, three things might become clear:



(*a*) 18th-century opera was less a snapshot of contemporary society than a controversial expression of particular desires and fantasies. It required active promotion to find its place in a society which neither needed nor could afford it. Around 1700, it still seemed exotic to most Europeans, while in Italy it survived thanks to its ability to entertain tourists. French and English observers of this time (Saint-Evremond, North, Addison) discuss Italian opera like a culinary object that was not a real alternative to proper food.

(*b*) Opera in Italy, hemmed in between academic complaints, ecclesiastical censorship, illiteracy, social restrictions on performers and the competition of improvised theatre, defended its cultural status by maintaining literary standards and humanist ideals while attracting the crowd with fine singing and spectacular staging. The concessions to popular taste, conventionality or star performers, which today are nostalgically seen as the essence of Italian opera altogether, conflicted with at least some of Italy's literary-dramatic traditions although they later helped to project a certain 'italianità' which inspired as well as limited its further development.

(*c*) Given, however, the strength of opera – Italian and other – in its appeal to fantasy, popularity or spontaneity, it is no wonder that so many artistic, intellectual and political trends in 18th-century Europe seized upon the genre to promote themselves. One of these trends was surely the emancipation of dramatic music, another the emancipation of the thinking individual (the Enlightenment). From the early claims of the courtly society on opera as a vehicle of absolutist propaganda, via bourgeois realism, sentimentalism and classicism to the impact of revolution and romanticism, the fate of opera in the 18th century was that it became ingrained in European culture.

2. Social practice.

(i) Institutions and circulation. Before 1690, opera was practised in Italy, at the court of Louis XIV and (with variable frequency) at about 20 courts of central Europe. In the following 100 years, Italian opera was taken up at another 40 courts and cities of central Europe and in the kingdoms of Spain, Portugal, England, Denmark, Sweden and Russia. This expansion was largely motivated by the

7. *Performance of an intermezzo at an Italian theatre: painting by Giuseppe de Albertis, late 18th century (Museo Teatrale alla Scala, Milan)*

social status of opera as a classicist and monarchic art. The courts, especially if influenced by Enlightenment ideas (Berlin, Dresden, Mannheim, Stuttgart, Milan, Florence, Parma), also appreciated the artistic and educational values of the genre. Metropolitan centres (Paris, Vienna, Madrid, St Petersburg, London) and even some secondary cities outside Italy witnessed an increasing competition, resisted by some courts, between Italian, French and local operatic traditions and their languages. Organizationally, there were of course vast differences between the status of a major court opera such as the Parisian Académie Royale de Musique (whose control had ramifications throughout the country) and, say, the business of the Venetian impresario Angelo Mingotti, who staged *opera seria* and comic intermezzos in Moravian and Austrian district towns (1732–*c*1745). There was a contrast of climate between the small but ambitious court operas in central and northern Germany (Bayreuth, Brunswick, Wolfenbüttel, Kassel, Düsseldorf) and the huge international opera fairground of Venice which continuously circulated plots, performers and musical settings. Civic opera was usually controlled by societies of gentlemen with the financial support of a court and of wealthy visitors, as in Venice, Prague and Hamburg. Impresarios managed productions either in the employ of courts and cities, or on a profit basis for themselves. They might rely on a central opera house, engaging new performers and authors each season, or move personnel and productions from place to place in the pursuit of new audiences. The economic principles were nevertheless comparable everywhere: patronage had to make up for the losses incurred through high production costs and uncertain or non-existent box-office takings. Financial patronage took many different forms, from that of shareholding companies (Royal Academy of Music, London) via ticket and box subscriptions to entirely court-financed businesses. In contrast to the even more spendthrift practices of the previous age, many institutions tried to contain costs by circulating productions: for example, by offering them in both palace and public performances (as in Naples, Florence, Paris/Versailles and Fontainebleau, Modena and Reggio nell'Emilia, Vienna, Berlin and Potsdam, Brunswick and Wolfenbüttel); by exchanging courtly and impresarial productions (northern Italy, Prague/Dresden, Hamburg/Brunswick); or by repeating productions in summer residences or secondary cities (Vienna, Rome, Tuscany, the Veneto). Repertories were hardly established yet, except for the cultivation of a Lullian corpus at the Académie Royale de Musique and in Brussels. Travelling companies were most likely to develop standard works and repertories. Still, the annual amount of new opera productions was always greater than that of revivals; in the period *c*1700–40 it could reach ten or eleven in Venice and five to seven in Vienna, London or Hamburg.

(ii) Genres. In the 18th century (unlike the 17th) genre distinctions, or occasionally their blurring, were a major issue. The precepts of the classicist, Aristotelian poetics influenced operatic practice and theory from about 1690, leading to a separation of tragic and comic genres. Much of this distinction had to do with the theatrical projection of social structures.

Comic *intermezzi per musica* (fig.7) were developed in Naples and Venice (*c*1700–06) and soon distributed to the north; full musical comedy began in Naples about 1707, and in the 1740s merged with Venetian parody operas to form *opera buffa*. Comic opera's social criticism, a task sanctioned by classical precedent, was never more radical than in these early years. Although many early *opere buffe* and intermezzos conform to the Aristotelian description of comedy (by portraying ordinary, contemporary and shrewd people), intermezzos were accepted in the court theatres as a divertissement, whereas *opere buffe* were at first considered low-class by aristocratic patrons. They depended, in any case, on the empathy of their spectators with the social connotations of the plots.

Tito assalir. Nel precipizio orrendo
E' scor-

8. *'La clemenza di Tito', Act 2 scene i: opening from Metastasio's 'Opere' (Venice: Zatta, 1781–3); (left) engraving of Act 2 scene xi by G. Zuliani after Antonio Novelli*

Serious opera conveyed its institutional and moral messages within a more autonomous aesthetic framework of vocal virtuosity, poetry and stagecraft. The artificiality of the theatre and the beauty of music functioned as 'pink spectacles' by which to observe truly human experiences, mediated by performers. The genre offered women on stage, beautiful costumes, changeable sets (*mutazioni di scena*), machine effects, dancing and fencing – effects that were criticized by some as sensual but were never given up. The social connotations of the genre are nevertheless specific. The association of the music with the moral implications of the plots (ethos and pathos) was perhaps greater than in other phases of opera history. An assiduous patron such as Emperor Charles VI in Vienna (1711–40) would request contrapuntal styles from his composers to match the lofty thoughts of his poets. In Pietro Metastasio's libretto *La clemenza di Tito* (1734; fig.8), it is taken for granted that Charles VI resembles Titus – and this prince finds his inner ethos by defying the claims of power, justice, convenience and the passions of love and fear. Such 'humanization of the great ones', showing them as subject to the same emotions that any spectator might feel, is an enlightened approach that was obscured in the 19th century (but exploited again in Hollywood cinema).

The narrative of Italian opera, whether concentrating on individual feelings in *opera seria* or on social practice in *opera buffa*, was guided by 'reason'. With exceptions depending on cultural context, it largely avoided the supposed irrationality of the *tragédie en musique*, which cultivated 'le merveilleux'. 18th-century French *grand opéra* (as it was already called) and *opéra comique* still adhered to wonder and spectacle, fuelling endless polemics right into the 1780s.

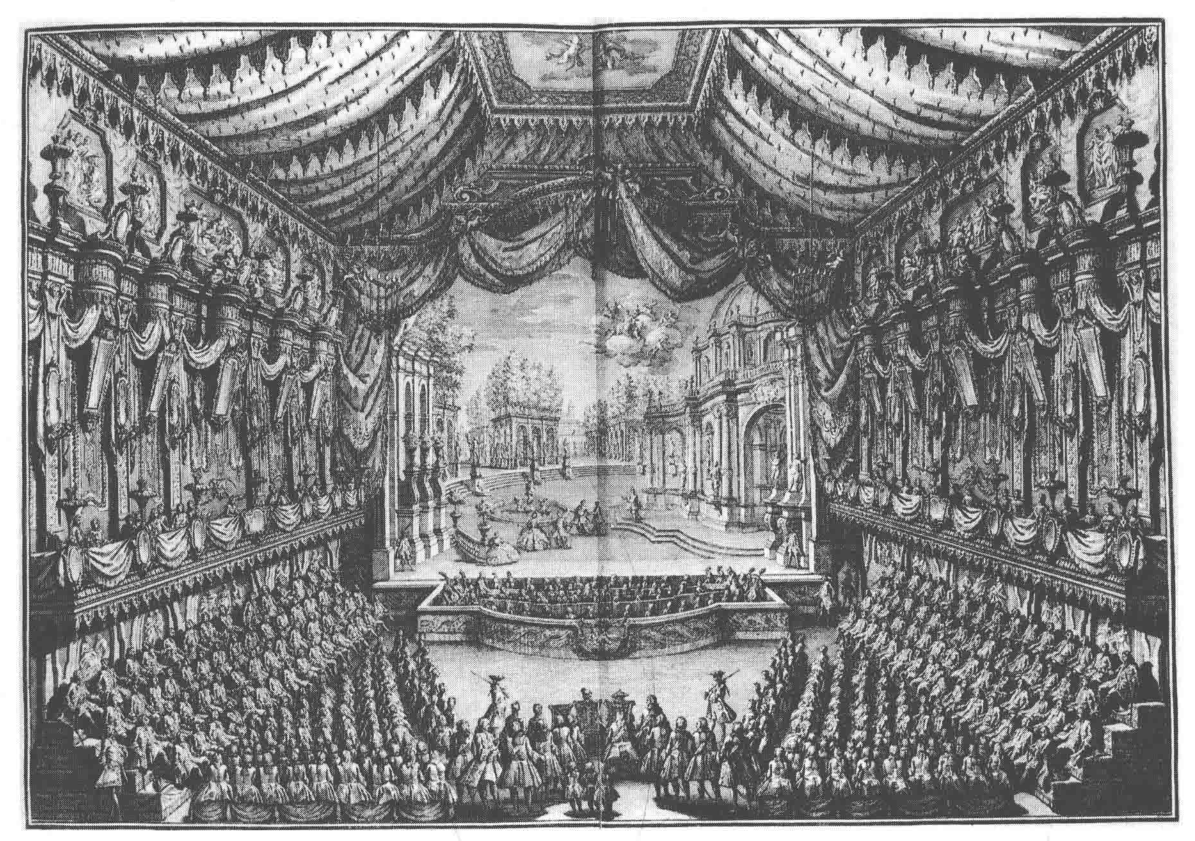
Early in the century, the parody plays of the Parisian fairground stages (fig.9) often satirized the latest *tragédies*.

9. *Stage of the company of Jean-Baptiste Nicolet at the Foire St Germain, Paris: engraving, 18th century*

The path from these spoken comedies with intermittent songs (*opéras comiques en vaudevilles*) to comic operas with spoken dialogue (*opéras comiques*, *opéras bouffons*, *comédies mêlées d'ariettes*) crossed, as it were, the demarcation between non-opera and opera. An analogous development is seen in opera parodies and parody intermezzos (later one-act *farse*) appearing in Venice, Florence, Hamburg, Vienna and elsewhere, often bourgeois in dramatic content and philosophy; these were the forerunners of comic operas or Singspiel. The fashion of the English ballad opera began in London with the parodistic *Beggar's Opera* of 1728. Spanish operas were traditionally mythological or pastoral zarzuelas and musical *comédies*; heroic, satirical and popular plots took over as time went on.

Some structural characteristics, particularly of Italian opera, were later criticized as 'rationalistic' or 'rigid', for example the alternation between recitatives (dialogue) and sung numbers. In reality, this alternation offered greater formal variety than most literary spoken drama of the time, which might be recited solely in Alexandrines, *versi sciolti* or blank verse. The inherited poetic forms for arias and ensembles – lyrical verse of the Anacreontic variety – reflected the sisterhood of music and poetry as in other Italian vocal genres, but their dramatic function was now co-determined by the surrounding sung dialogue, the recitative.

In comic genres in non-Italian languages, sung closed numbers usually alternated with spoken dialogue; additionally, recitatives were occasionally heard. The courts in Vienna and later in Paris forbade the use of recitative to the civic theatres, as this monopoly implied social status. There was thus a two-layered European tradition: the 'classical' and courtly form was Italian and French serious opera with recitative, whereas the comic and bourgeois genres with spoken dialogue represented the 'vernacular'. The exception was Italian comic opera, which always used recitative. This fact and the genre's through-composed musical forms (concertato finales, already found around 1720, were typical of *opera buffa*) contributed to its international status.



The use of spoken dialogue instead of recitative favoured various cross-currents and transfers, like *opera buffa* into *opéra comique* (from 1752) or *opéra comique* into Singspiel (from the 1760s in particular). From about mid-century, serious operas were created in English, Spanish and German, some originating as translations from French or Italian; and comic as well as heroic operas appeared in Russian and in Scandinavian languages. The distinction of genres relaxed as time went on: there were not only genre mixtures between comic and serious opera (*dramma eroicomico*, *opera semiseria*, *drame lyrique*) but also inflections of the aesthetic and social values formerly typical to the established genres, for example when exotic and serious subjects invaded *opéra comique* and *opera buffa* in the 1760s.

(iii) Performance and performers. A performative principle of 18th-century opera was the control of nature through its lifelike imitation, which involved artistic uses of the voice (coloratura), the body (dance, costume, gesture; fig.10), language (rhetoric) and of course the imagination. The realistic idea of mimicking people on stage was variously filtered through the artificial literary and musical texts and gestural conventions, the fantastic or complex plots, expensive decorations – which also entered the realistic and comic sub-genres – and above all through codes of public behaviour. Musical performers were highly trained specialists but also ambitious members of a society tied to decorum and etiquette. Performing standards, styles, manners and skills varied more widely than today; the performance itself was perhaps more often responsible for the success or failure of a work. Although audience appeal provided artistic clout to performers, their influence was socially and institutionally mediated; they depended on protectors and managers and on the goodwill of the authorities. In Rome in 1715, the satirical intermezzos *La Dirindina* by Girolamo Gigli and Domenico Scarlatti had to be withdrawn, by papal command, when the leading castrato refused to appear in the role of a pregnant prima donna. In Bologna in 1733, the soprano Anna Maria Peruzzi appealed against the allegedly bad music that J.A. Hasse had composed for her, but she had to sing it. Rows on or behind the stage found ample reflection in parody operas showing the predicament of the impresario between warring artists.

10. 'How to express feelings in silence': engraving from Franz Lang's 'Dissertatio de actione scenica' (Munich, 1727)

Opera continuously addressed issues of gender and class (for example by enacting behavioural norms on stage) and targeted social customs of dressing, fencing, dancing, feasting, litigating and so on. Women were not allowed on the public stage in the Church State, but otherwise appeared in far more opera houses than in the

11. Theatre in the Palazzo Reale, Naples, during a performance of Giuseppe de Majo's serenata 'Il sogno d'Olimpia', 6 November 1747: engraving by Giuseppe Vasi after Vincenzo Rè from 'Narrazione delle solenni reali feste fatte per celebrare in Napoli ... la nascita di ... Filippo Principe delle Due Sicilie' (Naples, 1748)

17th century. Despite discrimination and sexual exploitation, women often competed with castratos for the most lucrative roles. The interest in castrato voices, which increased until about 1770–80, has artistic, economic and probably social dimensions. They hardly ever appeared in France or in bourgeois opera genres.

Family and marital bonds were frequent among performers, composers and impresarios. In smaller companies, authors, managers and performers were sometimes one and the same, just as in the spoken theatre; examples of the personal union impresario-librettist-singer are found from Francesco Borosini (Vienna, 1724–*c*1731) and Antonio Denzio (Prague, 1724–35) to Emanuel Schikaneder (Vienna, 1783–1812).

The social and technical conventions of performance, such as role hierarchies or conducting and rehearsing routines, are familiar from contemporary criticism, which invariably deplores cliché and irrationality. Performers became more closely tied to the demands of individual works; the pasticcio practice, which had allowed them to insert their own favourite arias, scenes or ballet entrées into contexts for which they were not intended, declined after about 1760. Singers could become directly involved in stylistic and dramatic conceptions (for example the castrato Gaetano Guadagni in Gluck's opera reform); but on the whole, they lost influence on the literary or musical text while retaining their prominent status in the business.

(iv) Audiences. Opera-going was an activity reflecting personal interests or taste, as is evident from the polemics about it, but within a framework of social status and convenience. Court opera was attended by court members without payment and in deference to the ruler. Next came the large group of aristocratic or patrician patrons with their friends and guests (rarely their wives), who may have had sponsoring interests or who valued opera for social contact; this group has also left most of the written documentation of the practice. These people went to the opera as many times as possible and, if they travelled, in as many places as possible. Middle-class spectators were rare in court opera, as they could not afford the tickets, although there was the occasional free performance for 'all citizens' at such courts as Vienna or Brunswick. Servants could usually attend, free, in the gallery. The social spectrum of audiences, however, gradually expanded downwards, especially in the comic genres; the aristocracy, on the other hand, attended both types of entertainment throughout the century.

The shifts in attendance and dissemination corresponded to an unpredictable but, on the whole, massive publicity for opera, which exceeded the critical discourses about opera in other centuries. The operatic debate was disseminated across Europe by the literary élite in treatises, memoirs, letters, novels and new opera librettos, and it helped transform the genre itself in its relationship to public life. The early 18th-century Roman and Venetian fights over opera boxes (*guerre dei palchi*) were part of feuds between aristocratic clans; the London pamphlet wars around Handel, the Royal Academy of Music and

the Opera of the Nobility (1720–37) had political, literary and moral implications (the foreign genre itself was under scrutiny). The most famous debate, the pamphlet war of the Querelle des Bouffons (Paris, the early 1750s), exemplifies the way in which artistic, political and other convictions might crystallize around individual opera productions. The Gluckists and Piccinnists were moved both by literary ambition and by contrasting attitudes to Marie Antoinette's involvement in operatic reform at the hands of foreign composers.

Probably the most tangible and lasting effects of opera's public acclaim were found, in the course of the years, in opera itself, as its singing heroes, princesses, chambermaids, village philosophers and high priests learnt to pronounce the spectators' own beliefs and superstitions.

3. Stylistic evolution.

(i) Up to c1760. For Pier Jacopo Martello (*Della tragedia antica e moderna*, D1715), opera as a genre was to be avoided by the selfconscious poet. It was impure drama, perhaps to be redeemed in the distant future by the dramatic power of music. But in the same year, Antonio Salvi promised in the preface to his libretto *Amore e maestà* that, after the tragic catastrophe with the hero's death, the spectators 'would leave the theatre in tears, surrounded by sweet musical harmonies'. By directly engaging music in audience bonding – through sympathy, terror and compassion – this theatrical practice was heading for opera as we know it.

The 17th century had not posed the question of drama in opera with any rigour, and had rather indulged in the playgrounds of pastoral Arcadia and classical myth. Since about 1690, the Roman Accademia dell'Arcadia and other literary circles requested a return to utter simplicity or to spoken tragedy altogether. Hostility to opera on moral, national or social grounds also persisted, particularly outside Italy. Moderate supporters, some personally involved in the business as librettists (Apostolo Zeno, Pietro Pariati, Antonio Salvi, Barthold Feind) or composers (Mattheson, Telemann), attempted reform, adopting ethical and dramaturgical principles of French spoken drama (Corneille, Racine, Pradon, Molière). They insisted, however, on the legitimacy of a form of drama that is sung throughout, as it was at that time in serious and comic Italian and German opera and in the *tragédie en musique*. To transform canzonettas or couplets into scenic-dramatic monologues, or recitation into spontaneous utterances of a character, implied, first, a new aesthetic of word-setting. Symmetrical and dance-type arias yielded to long, pulsating *allegro* movements; melodic panache and rhythmic variety focussed listeners' attention on the lifelike musical process and the singer rather than the poetic form, without sacrificing declamatory impact.

The important questions of dramaturgy and verisimilitude (could Julius Caesar sing arias? how could a happy ending be made plausible?) concerned the imitation of human nature through music and thus the contribution of music to drama. Examples of such contributions which were deemed successful at the time are found in operas by Alessandro Scarlatti, Handel, Vinci, Hasse and Pergolesi (for example in his intermezzos *La serva padrona*, 1733). What had started as an ultimate refinement of the aesthetic of word-generated song here became a tendency of music to express affections, ethos and status of characters, even ideas and plots: the fabric of theatre itself. This move beyond words was made as the technical devices of coloratura, improvised cadenza, orchestral figuration and colour enhanced the imitative powers of music. The size and variety of timbre of opera orchestras were more rapidly increased than in any other period; the vocal coloraturas reflected the ambitions of a competitive profession. This first flourishing of *Tonmalerei* in opera is connected with composers such as Vivaldi, Telemann, Rameau or Jommelli in their very different ways.

The artistic representative of this phase of European opera was the poet Pietro Metastasio (1698–1782). In his earliest works, Metastasio benefited from the inspiration of a prima donna, Marianna Benti Bulgarelli, and he cultivated a lifelong friendship with the castrato Farinelli. The ethical and enlightened plots, the refined poetic language and Metastasio's superb dramaturgical skill must have helped singers to suspend their own disbelief in face of musical challenges.

Benedetto Marcello's *Il teatro alla moda* (D1720) satirized the provincial or old-fashioned habit of opera singers to stand occasionally beside their role and break the suspension of disbelief (they waved at their protectors, for example). This unwittingly 'epic' sort of theatre (in the Brechtian sense), which allowed for pregnant pauses or interruptions by audience reactions, often occurred in the unwritten sections of the performance such as cadenzas, or between aria and recitative. As time went on, the performative event became increasingly controlled by authorial agendas. Plot, stage action, even stage-sets, were increasingly 'composed out', for example in accompanied recitatives depicting nature and emotions. Their performance sounded more spontaneous than that of arias (as Francesco Algarotti emphasized, D1755) but had to be carefully rehearsed because of the tempo changes of the orchestral accompaniment. In *opera buffa*, parodistic effects and *lazzi* (set effects) were originally outside the jurisdiction of librettist or composer. The poet gained his control over them when censorship requested even intermezzo texts to be printed in advance. The composers learnt to express comic effects, as shown in operas by Pergolesi, Latilla and Galuppi, or in Hasse's intermezzos: *opera buffa* became synonymous also with a musical style.

The growing success of *opera buffa* with bourgeois as well as aristocratic audiences is reflected in the aesthetics and career of one of its main authors, Carlo Goldoni (1707–93). As a literary reformer, he intended his spoken plays as replacements of traditional, 'irregular' comedy; his almost 80 *buffa* librettos (*drammi giocosi per musica*) were of secondary importance to himself, but their very theatricality and enlightened moralism helped establish *opera buffa* as a musical genre throughout Europe. To a minor degree, the genre also indulged in musical parody, which relied on the reference to *opera seria* styles – as in Florian Gassmann's music for Calzabigi's *L'opera seria (La critica teatrale)* (1769, Vienna). In *opéra comique* and other vernacular forms, spoken dialogue was the home of verbal entertainment, at least with the better playwrights, but the rise of sentimental, fantastic and mixed plots in mid-century had the effect of channelling the advanced dramatic power of music towards non-heroic fields of expression.

(ii) c1760–90. An upsurge in operatic creativity in the 1760s and 70s was fuelled by a vastly expanding range of sources for plots, which now included novels, national

12. Act 2 scene x of Sarti's 'Giulio Sabino': engraving from the printed full score (Vienna, c1781)

histories and contemporary news items. Audiences could thus be exposed to stories reflecting the prevailing humanitarian values of the time, such as the cult of the family, the heroism of the humble, the dignity of non-Christian civilizations or the horrors of arbitrary power and unjust detention. Comic opera, while maintaining social satire as a staple dramatic device, engaged in the cultivation of the pathetic, where feminine characters gained in stature and women singers rose to a type of stardom strongly imbued with sentimentalism. Readily understandable subjects and familiar situations were only one aspect of a move towards realism which involved the whole range of operatic creation, production and criticism. The programmatic writings of Francesco Algarotti and Denis Diderot were linked to an increased attention to stage directions and the authenticity of costumes and sets.

Playhouses became starker in their inner decoration and what theatre historians call 'the fourth wall' made itself felt between the stage and the audience. While authors strove to present even the most fantastical events as 'believable' (see Mozart's letter about the supernatural voice in *Idomeneo*, 29 November 1780), the spectators' identification with the characters could reach extremes of emotional involvement, facilitated by packed houses and strong collective feelings.

Serious opera resorted to subjects and episodes which would have been regarded as shocking in the previous generation and were still widely frowned upon. Thus the decorum of Enlightenment opera lost ground to a display of spectacular effects which commentators related (positively or negatively) to the aesthetically 'impure' dramaturgy of the 17th century. Although the comic genre was more pliable and open to stylistic innovation, as shown by the development of the *drame lyrique* and its Italian offshoots, the *dramma serio per musica* or the *farsa sentimentale*, serious opera also proved to be ready for major evolutions, such as the staging of *comédies lyriques* at the Académie Royale de Musique or the burgeoning of the generically ambiguous *dramma eroicomico*.

Murders, suicides, battles, gothic settings and supernatural events naturally called for a spicier musical language, especially with regard to harmony and orchestration. But even the more traditional subjects were treated with strongly diversified poetic and musical means, concerning the stage action, aria types, the number of characters involved and the use of choruses; large-scale tonal planning and the use of recurring motifs promoted an overall 'musicalization' of opera to which contemporaries were keenly responsive. Formal flexibility and dramaturgical innovation were made possible by collaborative ventures, such as those of Goldoni and Galuppi, Calzabigi and Gluck (and perhaps Da Ponte and Mozart) or of the librettists Sedaine and Marmontel with various composers in Paris. Practices like the pasticcio or singer-induced alterations to existing works were not entirely abolished, but the creative status and public image of opera composers rose significantly, to the extent that Philidor

(in 1764) and Gluck (in 1767) could be explicitly recognized as the 'authors' of *Le sorcier* and *Alceste* respectively. When Gluck claimed that his presence at the performance of his works was as essential as the sun to the earth, he was setting an ideal for his successors of the 19th century.

V. The 19th century

1. Introduction. 2. Institutions. 3. Repertory. 4. Genres. 5. Plots. 6. Stylistic and formal changes. 7. National traditions. 8. Singers and other performers. 9. Staging. 10. Sources, dissemination. 11. Criticism, aesthetics.

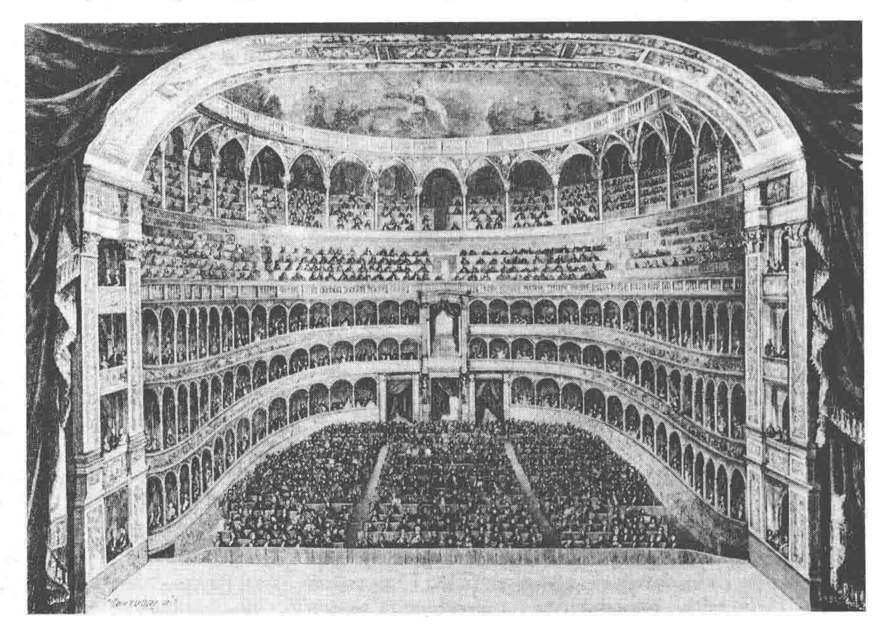
1. INTRODUCTION. However much some may lament the fact, and even though there are now signs of significant change, a large majority of the operas that form the present-day international repertory still hail from a slightly elongated 'long' 19th century, from around 1780 until around 1920. The most frequently performed operas all belong to this period. This curious centrality, not to mention the disturbing presentness of the most famous works, their constant 're-creation' in public and private spaces around the globe, makes any broad historical overview a daunting prospect. What is more, internal chronological divisions within the period are neither obvious nor commonly agreed on, nor does separation of the genre into various national schools, though these retained much currency, seem as unproblematic as it might be in dealing with the 18th century. Accordingly, the ensuing discussion does not follow chronological or national boundaries, relying instead on more neutral divisions that could apply to opera in any century.

As §IV indicates, the very term 'opera' underwent an important transformation during the 18th century, changing from a sub-species of spoken theatre into what was essentially a musical genre. Even though elements of the earlier definition remained in force in some areas during the early decades of the 19th century, perhaps particularly in the case of Italian serious opera, the period saw a gradual consolidation of this change, with music as more and more the dominant element and with the status of the librettist as a literary figure experiencing a sharp decline. On the other hand, in its new guise as a musical genre, opera lost aesthetic prestige, in particular in comparison to 'pure' instrumental music. Late 19th-century attempts to give the genre new status thus often sought to appropriate aspects of the 'symphonic' tradition while simultaneously striving to dignify afresh the non-musical aspects: by notions of the *Gesamtkunstwerk*, by publishing librettos as independent literary works or by developing the idea of *Literaturoper*, a type of opera that strives to preserve a pre-existing literary source more or less intact.

Possibly connected to the decline in the genre's literary status, the relationship of opera to larger currents in cultural and political history remains a source of lively debate and not infrequent puzzlement. Key cultural terms such as 'Romanticism' and 'realism' often seem to manifest themselves in opera at periods removed from their appearance in the other arts, or in strangely unemphatic contexts. As just one example, the literary polemics over Romanticism in Italy around 1816–18, or in France in the 1820s and 30s, although they focussed on drama, seemed largely to ignore opera, quite possibly because the genre had already (and without great resistance) escaped those restrictions of time and place that classicists saw as crucial to spoken drama, and because its language, its mode of discourse, was too extraordinary to be co-opted into the debate on either side. Of course, opera partook freely of the new, Romantic dramas as literary sources; but, significantly, it was able do so without radical readjustments to its outer nature, Romantic and classical subjects frequently remaining side by side in an otherwise largely unchanged formal and stylistic language. This is not to say that such broad cultural shifts did not affect opera profoundly: the new subjectivities that emerged with Romanticism certainly played powerfully across opera's expressive world; but the conjunctions are typically not as immediate as the sharing of certain literary texts might at first suggest.

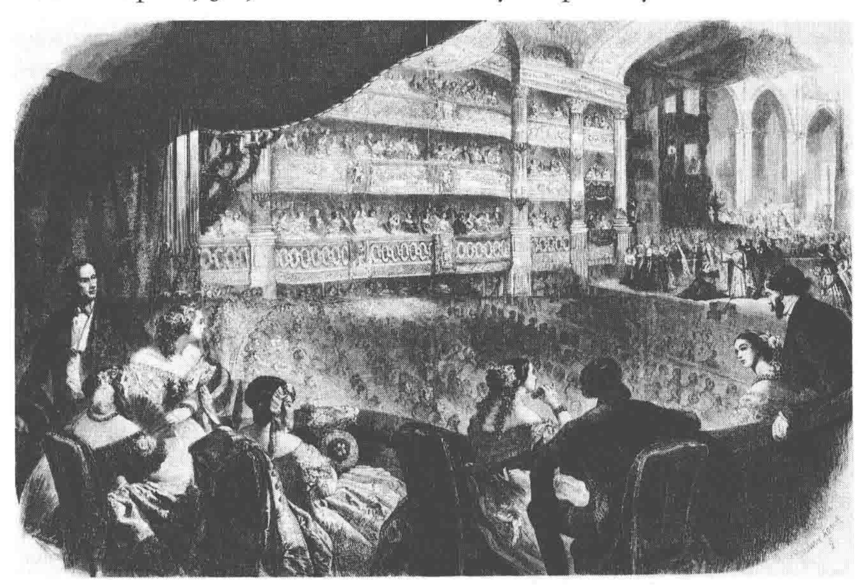
The same caution might be applied to opera's relationship to history in the broader sense. The political revolutions of the period interrupted the steady production and consumption of operatic pleasure in what are arguably no more than superficial ways, and the persistent association of certain composers (notably Auber, Verdi and a number of eastern Europeans) with insurrection and social unrest has far more to do with later 19th-century imaginings – nostalgia for a lost time of action – than with any contemporary evidence. Although it was inevitable that the opera house, as an important meeting-place for the urban bourgeois, occasionally became caught up in the century's great bourgeois revolutions, the theatre was far more often a place where the ruling class could rely on stability. This was more so as the century progressed and revolutionary movements embraced an ever wider socio-economic spectrum, many elements of which were excluded from all but the humblest of operatic representations. This is not, of course, to deny that opera in the 19th century was in many areas inescapably bound up with the idea of nation and national representation; merely to emphasize that political events and operatic events are very different, their relationship often complex and subterranean.

2. INSTITUTIONS. Towards the end of the 18th century, regular operatic performances could be seen through much of Europe, even as far afield as Russia. 50 years later, however, the genre had become a well-nigh global phenomenon. Apart from certain pockets of partial resistance, this expansion was primarily of Italian opera, first in a huge wave of Rossini fever (there was a Rossini vogue in Chile in the 1830s), and then of his followers, in particular Verdi. By 1870 the most popular of Verdi's operas were being performed in many a far-flung outpost in North, Central and South America, and they had also travelled to Australia, China, India and South Africa.



In the more remote regions, opera was often brought in by means of intrepid touring companies, bravely making use of an expanding system of rail transport. Within Europe, however, the number of theatres dedicated to fixed seasons of operatic performance increased considerably, especially during the first half of the 19th century. After the revolutions of 1848 there came about a gradual change, and a gradual decline in opera's economic fortunes in the main centres of western Europe. Partly this was a matter of changed public habits among the privileged classes: there were now other possible meeting-places, and new, competing forms of cultural activity. But it was also to do with the changing nature of operatic institutions.

Although traces of what might loosely be described as 'court opera' in the 17th- and 18th-century sense occasionally survived into the early 19th century, notably in Germany and Austria, by far the most common financial basis for an opera house was within a mixed economy. The key figure was the impresario, already much in evidence in the 18th century, who arranged seasons and engaged singers and composers, usually receiving some kind of subsidy from the theatre's owners (who might or might not be the local government) but also speculating at his own financial risk. The highpoint of the impresarios' power came in the first half of the 19th century, a period that saw powerful figures such as Louis Véron and his successors at the Paris Opéra; Alessandro Lanari, who controlled large regions of central Italy and thus to an extent coordinated the repertory and performing resources; and Bartolomeo Merelli, who arranged similar exchanges between such important centres as La Scala, Milan, and the Kärntnertortheater in Vienna. Looser connections took place between Her Majesty's Theatre in London and the Théâtre-Italien in Paris, though here the primary link was the shared services of a group of élite singers and their own preferred repertory.



The decline of the impresarios in the latter part of the 19th century marked several important changes in operatic life. The increasing establishment of a core repertory, and the consequent decline in production of new works (see below, §3), reduced the impresarios' role, as did the gradual strengthening of copyright controls (over both new and repertory works), which vastly increased the power of certain publishers, who now began to take a more active role in operatic production. Competition intensified, and profit margins decreased, with the gathering popularity of large, arena-type theatres later in the century (fig.13). For the major theatres, state funding, with impresarios likely to be little more than paid managers, became the norm; and this model continued its precarious existence through the 20th century.

3. Repertory. One of the key changes during this period was the decisive formation of an operatic repertory, the gradual emergence of a body of works that were revived countless times in countless different venues, and the consequent decline in the production of new operas. Repertory works were of course not unknown in the 18th century and earlier: the operas of Lully and Rameau had achieved something like that position in France, as had the oratorios of Handel in England. It should also be recalled that an operatic repertory of a kind did indeed exist in the 18th century, but that the 'work' was typically a libretto, not its musical setting: several of Metastasio's librettos were endlessly restaged in the 18th century, in numerous musical settings. Some of Mozart's operas (in particular *Don Giovanni*) may have tentatively established repertory status in England and Germany in the first decade of the 19th century, but the crucial change in direction occurred in Italy (the centre previously most resistant to repertory formation) and began with the most popular comic operas of Rossini, which established for themselves a permanent position around the globe, to be followed by various works by Bellini, Donizetti and Verdi. By the 1840s the term 'repertory opera' was in common use in Italy and rapidly spread elsewhere; the disruptions of 1848–9 and the international successes of Verdi's middle-period operas solidified the process.

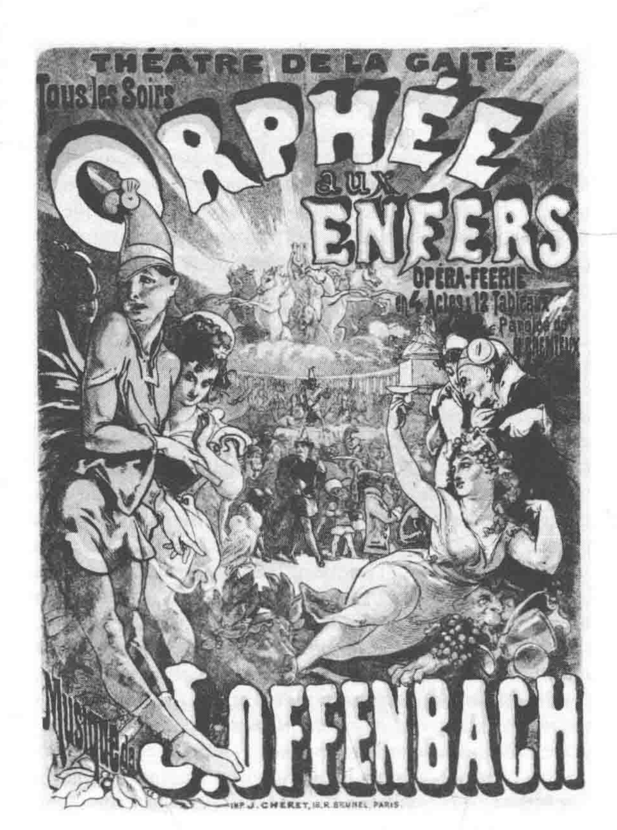
In the second half of the century, the idea of a repertory was thus firmly entrenched; but in its earliest phases the corpus changed quite radically. From the 1850s onwards, the first pan-European challenge to Italian hegemony came, from French *grand opéra*, in particular the works of Meyerbeer, which became a truly international phenomenon, even establishing a (highly contested) position in Italy itself (fig.14). Then, towards the end of the century, Wagner's operas gained ground, in several countries displacing all but the most hardy of Italian operas (it was not until the 1920s and 30s, with the so-called Verdi Renaissance, that Italian and German opera established a comfortable co-existence as the backbone of the repertory). Towards the end of the 19th century, with new operas becoming ever more scarce, we see glimmers of what, 100 years later, had become a major force: the idea of the operatic revival as an agent of repertory

13. Auditorium of the Teatro Costanzi, Rome, inaugurated 1880: engraving by Sabatini after Montuori

14. Interior of the Paris Opéra (Salle le Peletier) during Act 4 of Meyerbeer's 'Le prophète' (original production 1849): engraving by Gustave Janet

renewal. When Handel's *Almira* was performed in 1878 in Hamburg, it initiated a process that would grow steadily through the 20th century, though still not rapidly enough to challenge the central position still occupied by works from the 'long 19th century'.

The effects of this repertory formation on operatic institutions are referred to in §2 above. But there were other, equally important repercussions. During the first few decades of the 19th century, star singers tended to limit themselves to works in one national tradition, and could rely on making a living out of roles either written specially for them or in some way adapted to their strengths and weaknesses: choice of a company of singers would typically precede choice of repertory for a given season. By the end of the century this situation was often reversed, singers tending more and more to adapt their voices to a variety of roles and musical styles and composers being less willing to tailor roles for a particular voice. An international singing style emerged.



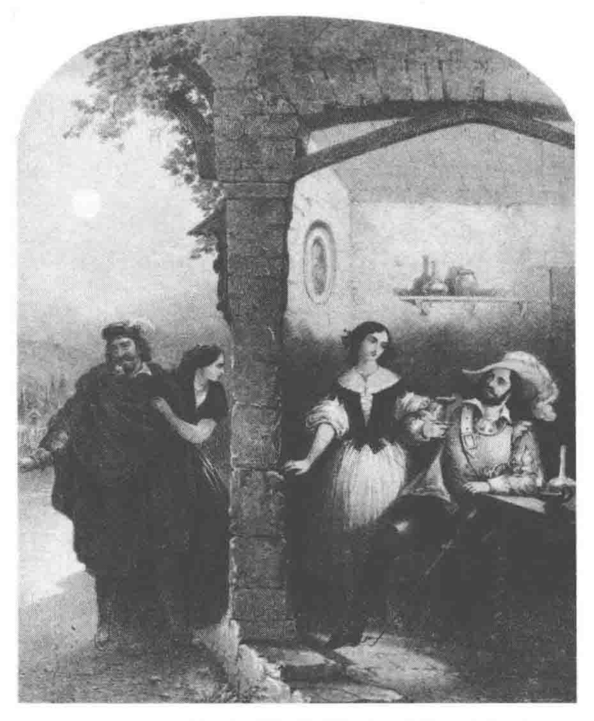
But perhaps the most fundamental change brought about by repertory opera occurred in the nature of operatic communication. In an operatic world based primarily on new works, composers had to produce quickly and to communicate immediately with audiences: if a work failed at its first performances, that failure was often absolute. Hence the importance of generic conventions, whose presence could stimulate and ease creative endeavour while at the same time offering audiences ready points of contact and a reassuring familiarity. Small wonder, then, that these conventions lost ground as the repertory set in. New works now had to pass a sterner test, defining themselves as ever more radically different from their competitors. As originality became increasingly the watchword, original composition became ever harder. The sense of an operatic tradition was lost, or rather was searched for in the ever more distant past.

4. Genres. The separation of comic and tragic genres that had been established in the 18th century was firmly in place, whatever the national school, at the start of the 19th century, and remained fairly constant for the first few decades. True, there was also a tradition of so-called 'mixed' works (the French *comédie larmoyante* or the Italian *opera semiseria*), but, rather than escape the traditional divisions, these types, the latter especially, tended to emphasize them further by using genre juxtaposition as a primary means of dramatic articulation. An additional continuity with the 18th century was in the tendency of comic works to occupy a less elevated position in the operatic pantheon, frequently appearing in minor theatres and addressing a less elevated audience. This tendency hardened in the decades around the middle of the century: Rossini-style comic operas, though retaining a robust currency, particularly in dialect traditions, became unpopular with the most successful composers.

However, this falling away or diluting of comic opera was accompanied by two highly significant developments. The first was an increased infiltration of comic scenes into serious opera. In Italy Verdi was active in this fusion of genres, integrating frankly comic scenes into several of his post-1850 operas. Perhaps even more striking, in France the later 19th-century *drame lyrique* owed at least as much to an earlier tradition of *opéra comique* as it did to *grand opéra*. Other national opera traditions of the later 19th century, the Russian and the Czech, seemed easily to embrace this mixture of the comic and the serious.

The second development was the emergence of a new genre, now known under the broad title of operetta. Though there were important precedents both in France and Germany, the decisive point is usually seen to be marked by the works of Offenbach in the 1850s, first known as *opéras bouffes* after the theatre in which they were initially presented (fig.15). The international popularity of this new style led to offshoots in other countries, each with a distinctive national character, and each drawing from indigenous traditions: the *Operetten* of Johann Strauss and others in central Europe (which owed something to the earlier Singspiel); the works of Gilbert and Sullivan in England (which drew energy from vaudeville and ballad opera traditions); the revival of the zarzuela in Spain and from there its dissemination to Central and South America.

5. Plots. Among the huge diversity of operatic plots in the 19th century, it would seem very difficult to trace



15. Poster for Offenbach's 'Orphée aux enfers', printed for the revised version at the Théâtre de la Gaîté, Paris, 1874: colour lithograph by Jules Cheret

purposeful lines of development. On the most basic level, however, one might hazard that the domination of French dramaturgical models seen at the end of the 18th century was in large part maintained through the next 100 years. When sea changes occurred in the manners of French spoken theatre – for example the advent of *mélodrame* in the early years of the 19th century, or the subsequent turn towards 'realism' around mid-century – then opera followed, and did so regardless of the various inflections brought on by national differences.

But certain large shifts in cultural attitude nevertheless left their mark. For example, opera plots are surely implicated in the now familiar idea that the 19th century saw an important turn away from what the sociologist Richard Sennett has called the idea of 'public man': an increasing tendency for ever more stressed and crowded urban dwellers to seek coherence not within the public world of politics and public display, which had so often betrayed them and was ever more obviously beyond their control, but rather within the private world of the family and of personal relationships generally. It has been plausibly suggested that this change is played out in operatic subjects: that those grand historical canvasses of the early century gradually gave way to 'claustrophobic' dramas, in which the individual's plight became the chief focus of attention (related to this could be the decline in the prestige of comic works, which inevitably lie more in the public world). For example, the decline of French *grand opéra* of the Meyerbeerian type has been traced in precisely these terms (Gerhard, E1992), and the progress of a composer such as Verdi, whose operas span a large part of the century, is a further case in point: although grand choral effects nearly always played a part in his works, the increasing manner in which individuals come to dominate the drama is obvious. Wagner's 'retreat' into myth in the second half of his career might be taken into this story with only a little sense of strain; and a seemingly logical end-point occurs in the early 20th century, with purely psychological works such as Debussy's *Pelléas et Mélisande* and Schoenberg's *Erwartung*, or with the operas of Puccini, in which any political aspects are more often than not overwhelmed by the focus on individual passions.

However, objections to this neat sense of progress come readily to mind. In the case of Verdi, while the progress from (say) the grand public spaces and themes of *Nabucco* to (say) the claustrophobia of *Otello* might seem compelling, important mature works such as *Don Carlos* will give pause, not least because that opera is arguably one in which the force of history, and thus of the public world, plays with unprecedented influence on the lives of the characters. And with Wagner there is the case of *Die Meistersinger*, in which the composer's dramaturgical techniques adapt with seeming ease to grand public spaces and overt historical gestures. More anomalous still are the operas from emerging national traditions such as those in Russia and elsewhere in eastern Europe, in which the epic style and large historical canvas continue to occupy the centre, albeit sometimes chaotically juxtaposed with an intense focus on individuals.

Undoubtedly related to these matters, and equally problematic, is another large shift, towards what is loosely called 'realism' (or *verismo*). Certain key works are routinely mentioned in this light: Verdi's *La traviata*,

16. Opening scene of Act 3 of Verdi's 'Rigoletto', Covent Garden, London, 1853, including (from left to right) Giorgio Ronconi (Rigoletto), Angiolina Bosio (Gilda), Constance Nantier-Didée (Maddalena) and Giovanni Mario (Duke of Mantua): lithograph from a contemporary sheet-music cover

which was originally set in almost-contemporary Paris, and which is suffused by the then modern rhythm of the waltz, or Bizet's *Carmen*, with its factory girls, common soldiers and criminals. However, in both cases, as in many others, the 'realistic' effects thus obtained are constantly compromised by their simultaneous status as elements of local colour, which causes them to be in some senses distanced from audience identification and thus made less realistic (there is also the obvious point that the reality of a Violetta or a Carmen was certainly not one to which the contemporary operatic audience would have aspired). Perhaps the literal geographical expansion of opera plots in the later 19th century, their tendency to explore ever more remote and mysterious areas, is in this sense a more significant development, not least because of the musical explorations that it inspired in so many composers. By the closing decades of the century, operatic 'exoticism' – particularly in the French and Italian traditions – had become so common as almost to function as an alternative routine, with its own stock collection of much circulated musical and visual representations.

6. STYLISTIC AND FORMAL CHANGES. The 19th century is conventionally seen as the great age of progress, and so it is perhaps not surprising that the history of its most important cultural products is also depicted primarily as an achievement of goals. In terms of opera, this sense of a gradual move towards some distant oasis (a goal often associated with some vaguely value-laden concept of drama) is typically inscribed on to the lives of individual composers or national schools. This is most striking in the case of Italian opera, whose 19th-century history is still sometimes thought of as a painful achievement of genuine dramatic values, effected by heroic individual effort in the face of formidable resistance.

In such a historiographical context, it is salutary to try to construct a more international picture, one that involves trends larger than those found in any individual composer or even national school. The rigid alternation of recitative (involving dialogue and stage action) and aria (involving monologue and reflection) had already been challenged by the later decades of the 18th century; but the first decades of the 19th century saw the decisive emergence of the multi-movement 'number' as the basic unit of operatic form. This unit was (perhaps as always) more predictable in Italy than elsewhere, but it nevertheless formed the backbone of much opera elsewhere (the partial exception was German opera, which favoured the strophic romance and tended to use multi-movement forms only to demonstrate a character's supposed italianate qualities). The number contained within it both static and kinetic movements, thus allowing for a variety of emotional representations (and a variety of vocal manners), as well as the injection of stage action – typically the entrance of a character with news from outside – to precipitate contrasting moods. During the early decades (longer in comic opera), recitative or spoken dialogue remained in currency; but this gradually became absorbed stylistically into the number. At the same time, the numbers tended to become less formally predictable and, above all, longer and more complex. Opera across all national styles became increasingly connected musically. By the end of the century it was common, at least in the most elevated styles, for act endings to become the only places of complete musical pause.

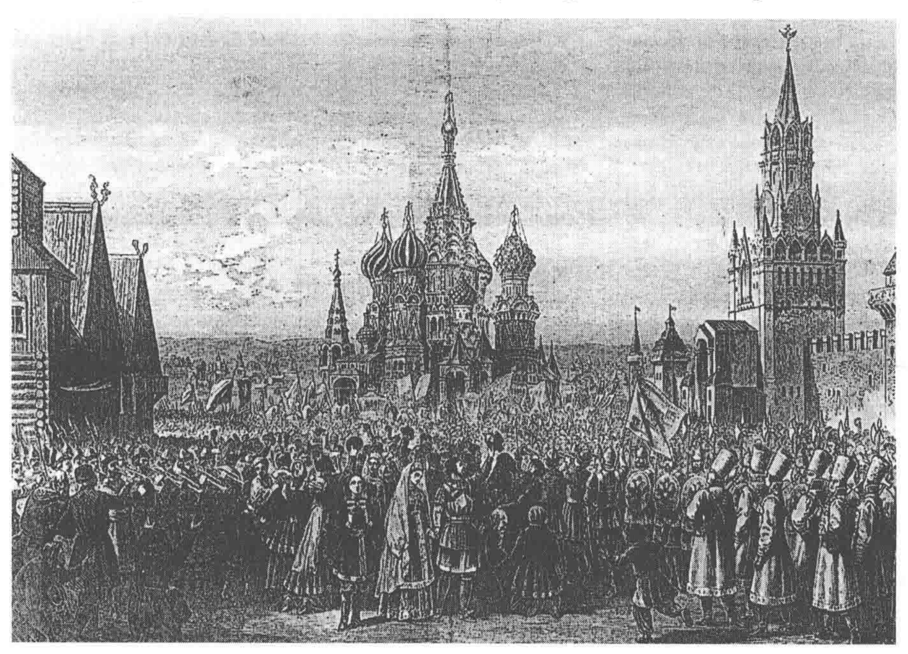
17. *Scenes from the original production of Delibes' 'Lakmé', Opéra-Comique (Salle Favart), Paris, 14 April 1883: engraving by Fortuné-Louis Méaulle after Defendi Semeghini from 'L'illustration' (28 April 1883)*

These formal changes brought with them other, equally important and equally pan-European, developments. One of the most striking was what has been called a 'dialoguizing' process, the sense in which opera in this period begins to present dialogue – which in classic 18th-century *opera seria* had taken place almost exclusively in recitative – as an increasingly central aspect of its communicative project. This in one sense brought opera closer to spoken drama, by the end of the century allowing such types as *Literaturopern* (works that use as their libretto an existing spoken drama with minimal alteration, although inevitably some cutting). It also meant that the duet in some ways replaced the aria as opera's normative mode of discourse. This should not be exaggerated. Partly because it was so central to opera's dissemination outside the theatre, in concerts and private venues both humble and elevated, the solo aria (or at worst the chunk of monologue) continued in firm currency in almost all types of opera through to the end of the 19th century, typically remaining an unproblematic aspect of the dramaturgy, not for example requiring special plot preparation to justify its presence. If anything, the hegemony of the aria in the public's operatic imagination was further strengthened by the appearance of recording, which was gathering pace as the century came to a close.

However, the combined effects of 'dialoguizing' and increased continuity, together with a falling away of predictable formal patterns, left room for, and perhaps necessitated, other levels of musical communication within opera. Probably the most important of these was by motivic means. Reminiscence motifs began to be extensively used during the last decade of the 18th century, mostly in France; during the first half of the 19th they appeared in most national styles, perhaps most commonly in German opera, least often in Italian, a point surely reflecting the so-called symphonic aspirations of German composers. In the second half of the century, this

tendency to supply an opera with some degree of motivic coherence became even stronger, most famously in Wagner's systematic use of the leitmotif in his later operas, a technique taken up by a great many at the *fin de siècle*. It is often said that leitmotifs should be rigorously distinguished from reminiscence motifs, in that the latter merely punctuate the musical discourse (in fact tending to articulate their message by their difference from their surroundings) while the former constitute the very basis of the musical fabric. But the matter is far from clearcut, not least because there are many stretches of mature Wagner that are (arguably) without leitmotifs: to characterize the musical material of his later operas as deriving exclusively from leitmotivic activity requires a degree of special pleading.

Just as significant: opera got noisier. Although (contrary to general belief) the string sections of operatic orchestras did not get much larger during the 19th century, what might be called the centre of gravity of the orchestra gradually slipped, with lower tessituras used for certain woodwind instruments (flutes and bassoons), a strengthening of the lower brass and the gradual addition of wind instruments of various kinds. These changes were of course related to developments elsewhere: in the demands made of operatic orchestras in the increasingly continuous operatic fabric; in theatre architecture and in the sheer size of venues (dictated by economic considerations); in changes in singing style; and in more general organological developments.



7. National traditions. In §1 it was suggested that the national differences so important to 18th-century opera gradually began to erode during the 19th century, to give way to an international style; but significant differences remain between the mainstream traditions even in the last decades, ones not only tied to the use of language. However, this process of internationalization may not always move in a direct line towards the century's end. It can be argued, for example, that the pull of French dramaturgical practice, together with the unprecedented prestige and magnificence of French *grand opéra* and the cosmopolitan leanings of Paris, made the 1830s and the beginning of the 40s an earlier moment of rapprochement between the major European traditions, at least within the most elevated genres (similar arguments might also be made for Paris in the first decade of the 19th century). With Italian composers such as Donizetti looking towards Paris and Parisian style, and with the young Wagner deeply influenced by *grand opéra*, one could suggest that Paris had fashioned around itself a European style. But it was not to last. The three most influential composers of the 1850s and 60s – Meyerbeer, Verdi and Wagner – all to some extent redefined a sense of national difference, even while the dissemination of their works was responsible for an internationalization of the repertory.

However, the 19th century also saw the decisive establishment of a number of other national traditions, in particular those in Russia, Poland and various parts of the Habsburg empire, notably the Czech lands and Hungary. All these areas saw vernacular opera during the 18th century, but – as in the case of Germany a little earlier – the formation of a 'national opera' was bound up with a gathering sense of national cultural identity. In all cases one can identify key works that managed, more by dint of multiple performance and/or association with political events than by using folk materials, to collect around them a potent miscellany of musical and dramatic or literary motifs that could come to symbolize the nation. The process here is important: rather than appropriating an already existing fund of national musical material, these operas typically constructed that material, becoming 'national' through their cumulative reception. In both Russia and the Czech lands, the founding fathers (Glinka with *A Life for the Tsar*, 1836: fig.18, and Smetana with *The Bartered Bride*, 1866, respectively) were merely the start of a flourishing tradition (albeit one that in Russia continued to find fierce competition from Italian opera), while the work of Erkel in Hungary and Moniuszko in Poland remained to some extent isolated. What is more, Russian opera in particular managed to penetrate the western European repertory, functioning within it as the standard representation of 'other' opera, not bound by any supposed dramaturgical or musical rules associated with the mainstream traditions.

For various political and cultural reasons, other countries found it more difficult to establish national traditions, although many tried. Spain is a typical example, first in the grip of Rossini, then Verdi, then (and always belatedly) dealing with the equally stifling influence of Wagner and Wagnerism. Other nascent traditions, in countries as far-flung and diverse as Argentina, Greece, Sweden and the USA (many more could be mentioned), had to wait until the 20th century for any decisive national opera to be formed.

8. Singers and other performers. As has already been mentioned, singers – those central purveyors of opera's message – maintained a substantial influence over the operatic event during much of the 19th century. During the first half of the century, and far beyond that in certain areas, the choice of a roster of singers was the first decision to be made in the construction of an operatic season: only when the performers had been fixed would composers and librettists be contracted, and these 'creators' would then make their decisions about subjects and treatments with a particular cast in mind. This applied even to composers of the greatest imaginable eminence. Verdi or Meyerbeer, for example, were both well aware that their new operas, if successful, were destined for repertory status, and thus to be performed under many different conditions and with many different casts; but they nevertheless tailored individual parts to the première cast, a restriction that seemed if anything to stimulate their creativity. However, as mentioned earlier, the increasing hold of the repertory system in the second half of the century inevitably meant that singers were less and less often involved in creating new roles, and so lost much of their influence, even at a time when increased mobility assured the most famous of them unprecedentedly large earnings.

One of the most striking aspects of vocal change during the period is the extent to which singers altered in type. By the 1830s the castratos, already in steep decline during the later 18th century, had all but disappeared from the operatic stage, their heroic roles first taken by the *contralto musico*, then by the Romantic tenor. This drop in the tessitura of heroes continued through the 19th century. In the early decades, for example, tenors freely used a 'mixed voice' to produce graceful high notes, but by the 1840s this had for the most part disappeared, giving way to a concentration on the more baritonal, heavier tenor range. The rise of the so-called heroic tenor roughly

18. Red Square, Moscow, in the closing scene of Glinka's 'A Life for the Tsar': engraving by L. Seryakov after K. Brozh showing a production c1850

coincided with the emergence of the dramatic baritone as his central antagonist, or even, particularly after 1850, as the principal character. All voice types gradually sacrificed flexibility for sheer power: the ornamental vocal writing that had been the province of all up to about 1820 had become by mid-century the exclusive domain of female singers, and then only a sub-group of them.

These changes, as already mentioned, are related to other developments in operatic practice: the need for greater power, for example, clearly went hand in hand with the expansion of the orchestra and of theatres generally. The shift away from soprano voices (which had dominated 18th-century opera) in heroic roles, and also perhaps the rise of the baritone, could be related to an increasing desire for a degree of operatic realism: opera came closer to the communicative codes of spoken drama if the singing voices of characters were differentiated in a manner similar to their vocal differentiation in a stage play. But there are also interesting ways in which these developments might cautiously be linked to wider cultural change.

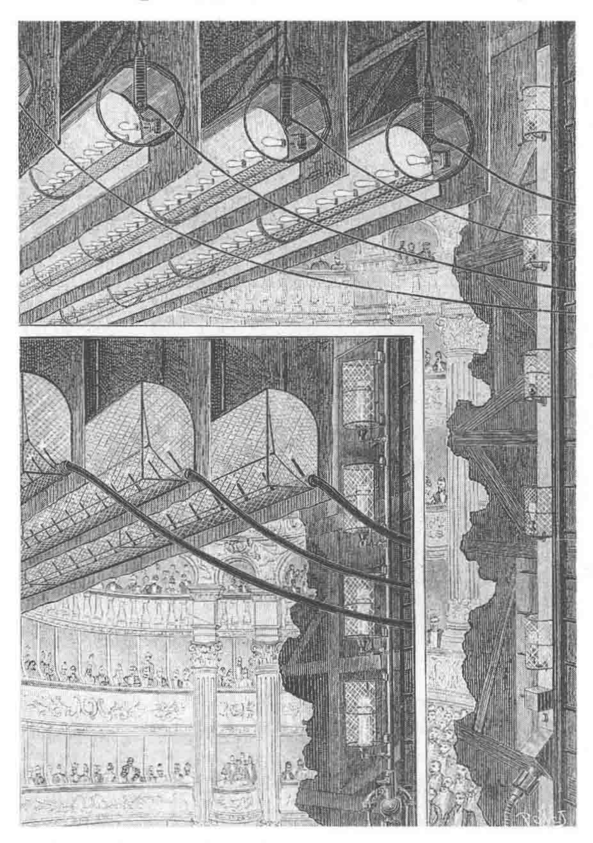
The situation of women on stage, for example, seems to invite such speculation. Although women were an accepted part of 18th-century theatrical life, their social position was frequently precarious. In part for this reason, women singers tended to come from theatrical families (where they would enjoy a degree of protection) and to come a poor second to the castratos in terms of earning power. However, the 19th century saw a great rise in the hegemony of the prima donna, and through most of the century (despite competition from star tenors) they could often outstrip their male colleagues in fame and fortune. Women of many stations now chose the life of an opera singer, seeing in it a chance for individual professional advancement otherwise rather rare for their sex. But it is at least arguable that this rise in status and professional power was accompanied by a tendency in opera plots to treat female roles as increasingly 'other': ever more powerless to effect the violent events that surround and all too often overwhelm them.

During the second half of the 19th century, the power of singers of either sex to influence the operatic event was being challenged by another interpreter: the conductor. At the start of the century, the typical method of coordinating the musical aspects of an operatic performance was by means of two directors: the *maestro al cembalo*, who at premières was often the composer and who often had a special responsibility for the vocal aspects; and the principal violin, who would use his bow to beat time and generally marshal the orchestra. This system fell into disuse around mid-century (earlier in Germany and England, later in Italy), to be replaced by something more like the modern conductor. By the end of the century the star conductor was gaining in influence, the most prominent of them having considerable sway over many aspects of the operatic event.

9. Staging. The idea that staging might be closely coordinated with other aspects of operatic performance of course existed well before the 19th century, but this period nevertheless brought about extensive revisions in both the practice and the philosophy of opera's visual system of communication. Much of the stimulus for this came first from German-speaking theatres, where already in the late 18th century considerable attention was being paid to the total effect of theatrical performance. By the 1820s Weber, in Dresden, was putting into operation a system in which all staging elements of an opera were selfconsciously to be united, taking particular trouble with soloists' (and even the chorus's) histrionic abilities.

Many of the developments were fuelled and encouraged by technological change: gas lighting appeared in theatres around 1820, electricity in the second half of the century (fig.20). Both of these were of course safer than previous, naked-flame alternatives; but they also allowed for greater sophistication of stage illusion, as did enlarged backstage spaces and more complex machinery. By the 1830s the acknowledged leader in these fields was the Paris Opéra, in which vast expense and untold energies went into creating elaborate visual display. This activity was marked

19. Final scene of Mascagni's 'Cavalleria rusticana' in the production at La Scala, Milan, 3 January 1891, with sets by Giovanni Zuccarelli: engraving by A. Bonamore, 1891



by the emergence of the so-called *livrets de mise en scène*, production books in which many aspects of the visual would be painstakingly notated, and which were intended to ensure that works first given in Paris would be 'correctly' mounted in the provinces and elsewhere. The *livrets'* appearance thus coincided with, and was inseparably linked to, the establishment of repertory opera, and called into question a crucial aesthetic issue: when revivals of a classic work were mounted, how far should the original staging of that work be considered part of its basic 'text'? The appearance of the *livrets* reflected a radically restrictive answer to these questions, each *livret* aiming to make certain aspects of the production a fixed text, and (often explicitly) to govern the visual manner in which the operas would be revived.

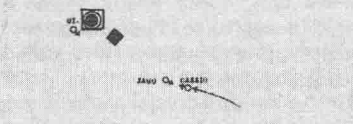
In houses devoted to Italian opera, whether in Italy or elsewhere, such issues were less pressing. During the first half of the 19th century, the librettist (or house poet) generally took charge of staging, and the sheer speed at which productions went on stage suggests that there was far more reliance on convention and routine solutions. However, the influence of French theatrical practice spread and by the 1860s elaborate *disposizioni sceniche*, directly modelled on the *livrets*, began to accompany the most prestigious premières (fig.21). By the 1870s and 80s, the grandest of grand operas, whether in France, Italy or Germany, were vast and fearsomely complex undertakings, great monuments to archaeology and Romantic illusion. The prototype of the modern director emerged, most obviously in the formidable presence of Richard Wagner, whose Bayreuth stagings of his operas in the late 1870s and early 80s pioneered a darkened auditorium, an orchestra hidden from view and a new, more 'naturalistic' acting style, all of which further intensified the sense of audience involvement in the visual spectacle (fig.22). Wagnerian attention to the spectacle was as much a revolution in audience behaviour as it was in directorial practice. Through much of the 19th century, the audience was by modern standards undisciplined and noisy: it was only when the advent of electric stage lighting allowed the auditorium to be in almost total darkness that anything like present-day silence became the norm.

10. Sources, dissemination. The practice of printing a libretto for each revival of an opera, for sale in or near the opera house and with information about the cast, other executants and often with a preface by the librettist, continued to roughly 1850 and was then gradually replaced by generic librettos produced by publishers. These documents served as an important point of communication with the public, were consulted by many in their (dimly) lit auditoriums and doubtless influenced the manner in which an opera was received in ways now difficult to imagine – surely, for example, highlighting the manner in which operatic music is a setting of a poetic text.

The 19th century also saw a consolidation and then vast expansion of the vocal score as the prime physical means of disseminating the musical text of an opera. Early in the century, particularly in Italy, individual numbers ('pezzi staccati') would often be released first; the complete score could later be assembled by binding these pieces together. Printed full orchestral scores were rare in Italy until near the end of the century (and then were usually for hire only) and appeared in Germany only in certain exceptional cases (Mozart, Weber and especially Wagner). In France, however, the earlier tradition of publishing full scores of the most successful works continued through much of the century. Even where printed scores existed, however, manuscript copies were still the primary means by which the complete text of an opera was distributed to theatres.

While vocal scores clearly aided the dissemination of operas into both private and public spaces, a far more widespread and voluminous means, practically the invention of the 19th century, was the published operatic transcription. In Italy and France particularly, a successful opera of mid-century would be released in an enormous number of arrangements: for piano solo, piano duet, for

20. Electric battens and wing lights at the Paris Opéra (Salle Garnier) with (inset) the gas fittings they replaced: engraving from 'L'illustration' (18 June 1887)

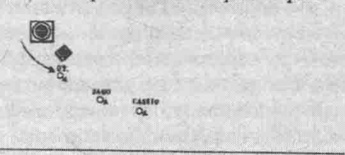


various instruments and piano, for other (sometimes unlikely) combinations and also in numerous more 'creative' versions, entitled fantasias or reminiscences, sometimes as grand and ambitious as those of Liszt, sometimes much more modest. This corpus of material suggests that operatic music was a major part of the repertory of private salons, or indeed of anywhere that the piano and other instruments were played by amateurs. 19th-century concerts, too, were much more likely to involve either operatic excerpts, arrangements or reminiscences than their counterparts today. Operatic texts and subjects were diffused in less grand venues: in the marionette theatres of Italy, the burlesques of England, the magic lantern shows of Germany and of course the barrel organs of all these places. There is even evidence that operatic melodies sometimes drifted into the channels of oral transmission, to re-emerge as supposed folk material collected by ethnographers in the 20th century. It is probably true that opera, as publicly performed in urban theatres, can rarely be termed popular entertainment in anything like a modern sense (a partial exception might be made of the period between about 1860 and the advent of the cinema, but then only in places with a large Italian population). It is however also true that opera during this period became a phenomenon much broader than merely its theatrical diffusion, however extensive, might suggest.

11. Criticism, aesthetics. The considerable expansion in so many domains of operatic activity during this period

(a)

Jago profitterà di questa mossa di **Cassio**, per guardare rapidamente dalla parte di **Otello**: poi si rivolge a **Cassio**, e gli dice ad alta voce: *L'hai teco?* **Cassio** estrae dal giustacuore il fazzoletto di **Desdemona** (1), ed avvicinandosi a **Jago**, esclama: *Guarda.*



Jago prendendo il fazzoletto, in modo che si spieghi, lo osserva e dice, con ammirazione: *Qual meraviglia!* **Cassio**, rimane pensieroso, perchè ignora a chi appartenga il fazzoletto, **Jago** guarderà nuovamente dalla parte di **Otello**, che sarà sempre più agitato:

e col pretesto d'inchinarsi scherzosamente a **Cassio**, nel dirgli: *Bel cavaliere*, indietreggia di due passi, e mentre colla sinistra fa un cenno di scherzoso rallegramento a **Cassio**, mette la destra, col fazzoletto, dietro la schiena, perchè **Otello** lo possa osservare, e così trovasi fra **Cassio** ed **Otello**, in modo che il primo non veda il secondo.

Otello s'avvicina con molta cautela a due o tre passi dietro le spalle di **Jago**, osserva il fazzoletto, e con urlo represso esclama: *È quello! è quello!*

(1) Questo fazzoletto dev'essere lo stesso che portava Desdemona nel 2.° Atto, e che raccolto da terra da Emilia, fu carpito poi da Jago: è quindi necessario che presenti qualche cosa di strano, di rimarchevole: dovrà essere fatto con un tessuto bianco sottilissimo, sia garza di seta, o battista assai fine: avrà tutt'intorno un ricamo a fili d'oro e seta rossa e verde, formante un ornato a fiori, di stile moresco: in un angolo una grandissima cifra in lettere arabe, ricamata in oro e nero: dimensioni, 45 centimetri circa, quadrati.

(b)

is nowhere more evident than in discourse about the topic. The 19th century saw a huge rise in periodical publication, and a large number of periodicals either included extensive reference to, or were entirely dedicated to, operatic activity. Distinguished titles such as the *Allgemeine musikalische Zeitung* (Leipzig), the *Gazzetta musicale di Milano* and the *Revue et gazette musicale de Paris* were accompanied by an enormous number of less ambitious publications. The centre of this activity, at least in terms of bulk, was Paris, in which an important première at the middle of the century would stimulate as many as 20 or 30 separate reviews, many of them lengthy. This outpouring only increased as the century went on, with periodicals tending to become yet more specialized, sometimes even being devoted to a single composer (usually Wagner).

Much of the criticism thus produced was of course directed towards performances and performers, and was written to routine formulae; what is more, many of the opinions expressed were evidently inspired by the owners of the publication, who frequently had biasses deriving from financial and/or political interests. Many of the century's most acute critics, however, plied their trade in periodicals: E.T.A. Hoffmann, Schumann, Hanslick, Berlioz, Castil-Blaze, Basevi, Boito, Serov, Stasov and numerous others. The fact that several of these writers were also composers marks an important change in the status of writing about music, one that was perhaps not to reach its climax until the 20th century. The most influential writer about opera in the later part of the century was of course also its most influential composer. In one sense, Wagner's programmes of operatic reform had echoes in

countless other such proposals from the past, some of them (Mercadante's, for example) quite recent: a call for renewal in the relationship between music and words; a return to an ancient, ideal concept of drama. But one important difference was that Wagner wrote from an aesthetic standpoint in which absolute music was in a position of ascendancy in relation to opera, at least among an élite of philosophers. It was a standpoint he attempted, by complex reasoning, to challenge as far as his own operas were concerned, and his views were enormously influential, not least among the scholars who now began to analyse his operas within the newly formed discipline of musicology.

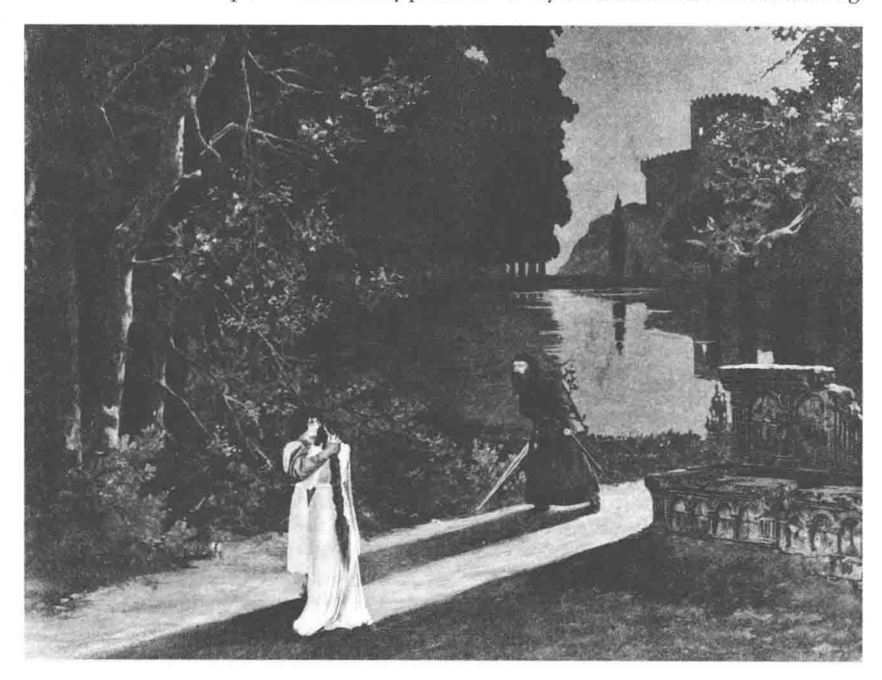
VI. The 20th century

1. FOUNDATIONS. At the very beginning of the century the particular dominance of Wagner and Verdi (who died in 1901, and whose final opera *Falstaff* had been first performed in 1893) had already been countered by the quieter Romanticism of Humperdinck and the down-to-earth lyricism of the early Puccini; while in France the alternative tradition associated with Gounod and Bizet lived on in Charpentier's *Louise* (1900). Composers from further east – the Russians Tchaikovsky, Musorgsky and Rimsky-Korsakov, the Bohemian Dvořák – represented examples of vital and increasingly influential national traditions. From this perspective the emergence of Richard Strauss's mature operatic voice in *Salome* (1905) can be viewed as a re-engagement with the more forceful and intense aspects of the Wagnerian heritage that might otherwise have been lost (fig.23). After all, while most early 20th-century composers, whatever their regional accent, used a musical language in which chromatic and diatonic tendencies engaged in a flexibly organized dialogue, and to a greater or lesser extent followed the Wagnerian (and late Verdian) practice of large-scale, through-composed forms rather than the strongly contrasted, separate numbers and formal types of earlier opera, the temper of the times immediately before *Salome* had not led composers to seek out such controversial subject matter, nor to provide such disturbing, extravagantly insistent music.

After *Salome* and its immediate successor, the epic tragedy *Elektra* (1909), which brought the post-Wagnerian tradition of a large-scale, single-act drama to its zenith, Strauss himself changed direction and, with *Der Rosenkavalier* (1911), *Ariadne auf Naxos* (1912) and *Die Frau ohne Schatten* (1919), sought out a different world, in which the violent and the shocking were less all-pervading and comedy and romance might each find a prominent place. The success that gave Strauss the opportunity to move in this direction was in itself a result of cultural attitudes which regarded the presence of an opera house as a necessary part of a civilized social structure, thus creating, during the 19th century, the need for repertory at a time when the new was more highly regarded than the old.

The persistence of such attitudes into the 20th century was particularly apparent in the German-speaking countries. In the years before 1940, these countries sustained an operatic culture in which several second-rank composers were able to achieve regular performance with works whose style and subject matter reflected the achievements of Wagner, Strauss and Humperdinck without being so pale a shadow that their artistic value was utterly negligible. Such operas as Pfitzner's *Palestrina* (1917), Schreker's *Der ferne Klang* (1912), Korngold's *Die tote Stadt* (1920) and Zemlinsky's *Eine florentinische Tragödie* (1917) display an adaptability, and the ability to feed off such potent sources as Wagner's myth-making, Strauss's 'decadent' Expressionism and Puccini's lyric realism, while adding something distinctive. Of such composers in the century's first three decades, no example is more remarkable than that of Siegfried Wagner, who composed 17 stage works between 1899 and 1930, several of which were successful. Few have been regularly revived since his death.

2. CONTINUITY AND CHANGE. While some of the greatest operas of the century's early years, such as *Elektra* and Puccini's *La fanciulla del West* (1910), acknowledged, and even helped to legitimize, the more radical harmonic



23. Scene from the original production of Richard Strauss's 'Salome', Hofoper, Dresden, 9 December 1905: engraving from 'Illustrirte Zeitung' [Leipzig] (1905)

practices of the time, such truly innovatory stage works as Schoenberg's 30-minute monodrama *Erwartung* (written in 1909) and his no less concise 'drama with music' *Die glückliche Hand* (written in 1913) both had to wait until 1924 for their premières. For all its technical radicalism, *Erwartung* can still be seen as a product of the Wagnerian obsession with female psychopathology (Isolde, Kundry), and the difficulty of avoiding some degree of intersection with Wagner is equally evident in the no less individual case of Debussy's *Pelléas et Mélisande* (begun in 1893, completed and first performed in 1902; fig.24). That Debussy's opera became one of the century's most widely admired and regularly performed is the more impressive for the fact that it exercised relatively little obvious influence on later operatic composition, and even works which are evidently beholden to it in some respects – Bartók's *Bluebeard's Castle* (1918), for example – are no less strikingly different from it in certain fundamental ways.

In *Pelléas*, Debussy showed how a musical genre deeply indebted to Wagner's stylistic and structural procedures could achieve a notably individual accent by adopting a very different rhetoric and a dramatic subject which, if hardly non-Wagnerian in the sense of contemporary or naturalistic, along the lines of *Louise* or Puccini's *Madama Butterfly* (1904), was quite different in its emphasis on a purely human vulnerability. As *Erwartung* and *Bluebeard's Castle* both illustrate, progressiveness in early 20th-century opera was not simply a matter of replacing emphatic assertion with understatement; but the progressive aspects of the music and the unambiguous focus on the dark side of human psychology, in extremely concentrated structures, give both works a distinctively modern quality that distances them decisively from Wagner and Strauss. Even more radically, though very peripheral at the time, Holst's *Sāvitri* (completed in 1908, first performed 1916) adumbrated a kind of chamber opera, avowedly anti-Wagnerian in style which, if not naturalistic in subject matter, was very unlike any 19th-century variety of music drama. While even *Sāvitri* cannot escape all links with the still potent Wagnerian past, it represents a decisive shift of emphasis, and it served as a pioneering example to Benjamin Britten in his exploration of the world of chamber opera after 1945.

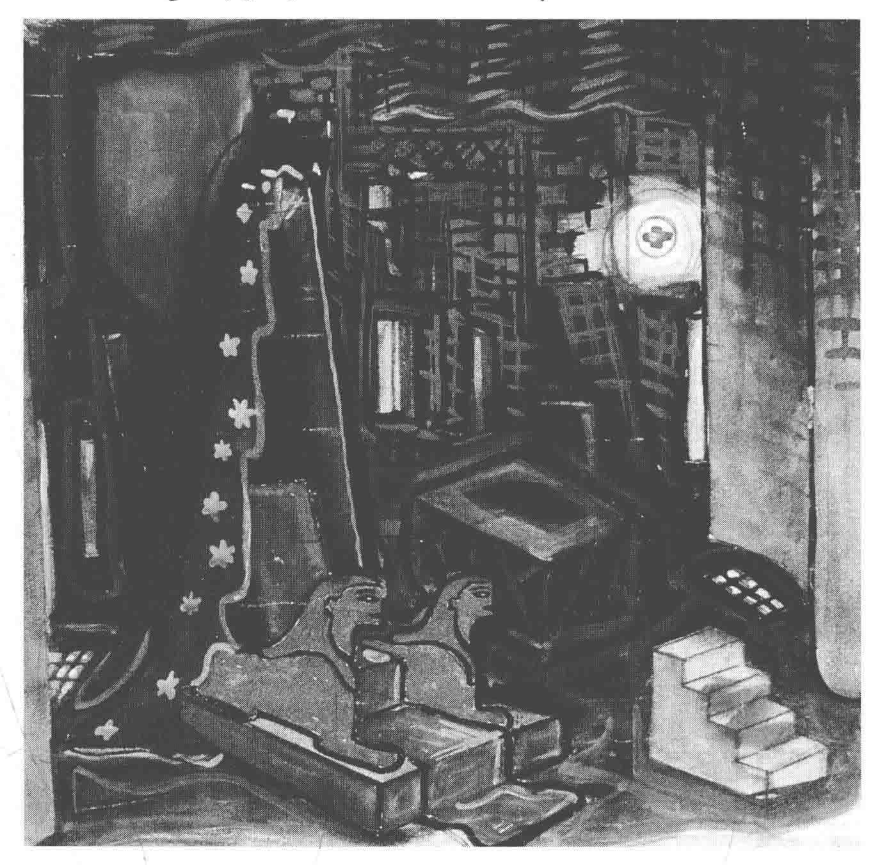
3. 20TH-CENTURY TOPICS. The kind of sympathy for human weakness and helplessness in the face of fate found in operas such as *Pelléas* and *Madama Butterfly* was, in the broadest terms, to provide a more fundamental theme for 20th-century opera than the Wagnerian epic world of gods and heroes. To this extent, the typical 20th-century operatic topic, in which vulnerability itself can attain either a heroic or an anti-heroic dimension, might be derived more directly from the 'real life' protagonists of Verdi or Musorgsky. It is not that gods and heroes disappeared from 20th-century opera (or that the gods and heroes of earlier operas, even Wagner's, are actually invulnerable), rather that 20th-century opera, in common with other artistic genres, tended to prefer a direct relation to the real world, even when that tendency reinforced the genre's own artificiality and unreality. A crucial factor is that 20th-century treatments of non-naturalistic subject matter – myth, allegory and fantasy – often acquired an ambiguous quality through the nature of a musical language that found affirmation and positive resolution far more problematic than did the language of the essentially tonal, consonant past.

20th-century composers also favoured those timeless yet familiar topics, such as the Orpheus myth, that had been explored in the genre from the beginning. Such infinitely adaptable topics are open to exploratory treatment while remaining within the perceived borders of the operatic genre. The adaptability of certain archetypal topics to treatment in an explicitly 20th-century style is one reason why new operas were heard with reasonable frequency despite the sustained preference for works from earlier periods. Far from relegating earlier works to the status of occasional revival, the production of operas composed in the 20th century was commercially and artistically possible mainly because the institutions seeking

24. Design by Lucien Jusseaume for Act 4 scene iv of Debussy's 'Pelléas et Mélisande', first performed at the Opéra-Comique, Paris, 30 April 1902

to promote them were primarily supported by a standard repertory that contained very few 20th-century works.

4. TOWARDS MID-CENTURY. After 1914 an essentially late Romantic, heroic kind of opera maintained a powerful rearguard action, not only in Strauss, but in Szymanowski's *King Roger* (1926), Enescu's *Oedipe* (1936) and Busoni's *Doktor Faust* (unfinished, 1925), to cite only three of the most memorable. The evolution of atonal, expressionistic opera continued from Schoenberg's *Erwartung* to *Die glückliche Hand*, and on to the greatest example of the genre, Berg's *Wozzeck* (1925). The exploration of alternatives to large-scale theatrical presentation found in Stravinsky's 'burlesque in song and dance', *Renard* (1922) and *Histoire du soldat* (1918 – 'to be read, played and danced'), led to forms of music theatre that achieved their greatest impact after 1950, while a no less potent naturalism reached its apex in Janáček's *Káťa Kabanová* (1921), a work that amply fulfilled the promise and personal style revealed in his much earlier stage work *Jenůfa* (1904, with later revisions). The possibility of coping with comedy, fantasy, or a mixture of the two while avoiding expansive Straussian or Puccinian lyricism was shown in Stravinsky's *The Nightingale* (1914), Busoni's *Arlecchino* (1917), Prokofiev's *The Love for Three Oranges* (1921) and Janáček's *The Excursions of Mr Brouček* (1920) and *The Cunning Little Vixen* (1924), as well as in Ravel's *L'heure espagnole* (1911) and *L'enfant et les sortilèges* (1925): and no account of the period should omit the crowning glory of Puccini's output, the not quite completed but highly characteristic *Turandot* (1926).



By the 1920s the musical battle lines had been drawn between an apparent radicalism (Schoenbergian serialism) that sought to submerge rather than celebrate its debts to the past, and an approach – neo-classicism – that celebrated the vitality of the confrontation between past and present, tonal styles and post-tonal techniques. In opera this led to such obvious and profound contrasts as those between Stravinsky's opera-oratorio *Oedipus rex* (1928) and Schoenberg's *Moses und Aron* (composed 1930–32), two treatments of epic-mythic topics that could hardly be more different in musical character and dramatic conception, even if they are closely related in their exploration of how, respectively, Oedipus and Moses move from positions of supreme power to tragic isolation. Differences and similarities may also be compared in two other near-contemporary works, Berg's *Lulu* (1937) and Shostakovich's *Lady Macbeth of the Mtsensk District* (1934). Each portrays the progressive degradation of the principal character with supreme conviction, even though the musical processes could scarcely be more different – Berg's progressive, Shostakovich's relatively conservative. Notoriously, the history of *Lady Macbeth* is bound up with the repressive cultural principles operative in the Soviet era, when the most challenging works by Russian-born composers, such as Prokofiev's *The Fiery Angel* (begun 1919, revised version completed 1927), could be heard only outside Russia, and the most profound operatic treatment of a Russian story was achieved by a composer from a different European country, Janáček, with *From the House of the Dead* (1930).

More fundamental, during the 1920s and 30s, was the contrast between the assumption, common to all the works just mentioned, that opera and its derivatives are forms of high art at its highest, and the view that the genre needed to come down from its Olympian heights and engage with reality much more directly, even didactically. It was not such a great step from Expressionist opera's use of 'low-life' contexts, as in the pub band in *Wozzeck*, to the more central focus on popular, jazz idioms in Krenek's *Jonny spielt auf* (1927). Far more radical was the wholesale shift of attitude embodied in the two Brecht-Weill collaborations, *Die Dreigroschenoper* (1928) and *Aufstieg und Fall der Stadt Mahagonny* (1930; fig.26). In accordance with Brecht's theory of 'epic theatre', the relationship between music and drama is intentionally ambiguous, and music is freed from its time-honoured operatic responsibility of supporting and representing what the words state and imply, just as the form of the work as a whole seeks to reject the highly unified, organic structures promoted during and after the 19th century. Yet *Mahagonny*, in particular, is scarcely anti-operatic: indeed, its importance is not in what it rejects, but in the way it revives the more stylized principles of the number opera and shows their suitability for the range of emotions and situations proper to a modern dramatic subject. With *Mahagonny*, as with Gershwin's *Porgy and Bess* (1935) a few years later, the foundations were laid for the parallel development, later in the century, of relatively naturalistic subjects, stemming from Janáček, Weill and Gershwin, alongside the persistence of epic and fantasy.

5. MID-CENTURY PERSPECTIVES. By the early 1950s, with what can now be regarded as the masterwork of neo-classical opera, Stravinsky's *The Rake's Progress* (1951), the powerful political allegory of Dallapiccola's 12-note *Il prigioniero* (1950) and the lively traditionalism of Britten's early operas (*Peter Grimes*, 1945, fig.27; *The Rape of Lucretia*, 1946; *Albert Herring*, 1947; *Billy Budd*, 1951), as well as the first stage works of Hans Werner Henze (*Boulevard Solitude*, 1951; *König Hirsch*, 1956), the genre's health and survivability could not be denied – or denied only by young firebrands like Pierre Boulez who, on principle, associated opera with all that was most decadent and retrogressive in art. Boulez's recantation, which took the form of many remarkable performances in the theatre, including some of 20th-century operas (Debussy, Berg), as well as long-considered plans for a stage work of his own based on a play by Jean Genet, was at worst an acceptance of the inevitable, at best an acknowledgment that his earlier objections were mistaken.

With both Henze and Britten, early success fuelled the kind of regular demand for their work that required immense reserves of energy and creativity. As music dramatists, they are not obviously innovative, even though, in Britten's case, his preference after *Peter Grimes* for chamber opera, including the three 'parables for church performance' composed in the 1960s, represents a significant shift of commitment from the large-scale theatrical enterprise. Even if not strictly speaking chamber operas, given the resources required to stage them, Britten's last two operas, *Owen Wingrave* (1971) – originally intended for television – and *Death in Venice* (1973), have an intimate quality very different from the grander projections of *Peter Grimes*, *Billy Budd* or *Gloriana* (1953).

Britten and Henze both developed distinctively personal styles in their early years, and both, at their best, brought a strong sense of expressive depth as well as theatrical

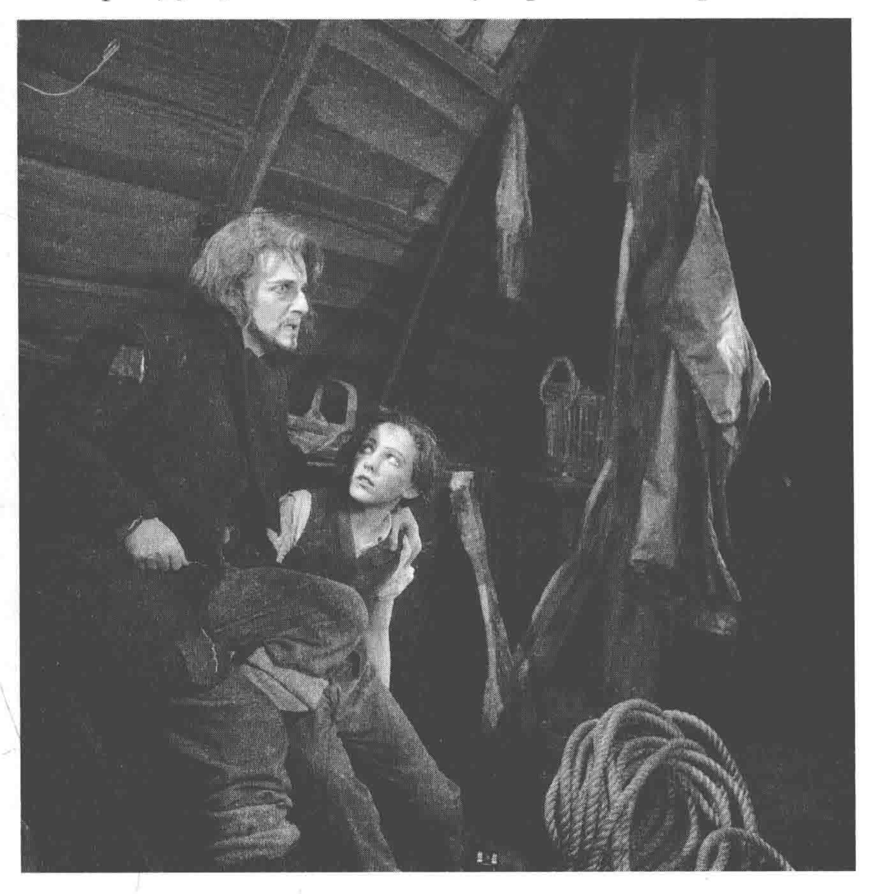
25. Act 2 (backstage at the theatre after Emilia Marty's performance) of Janáček's opera 'The Makropulos Affair': set design by Josef Čapek for the Prague première, 1928 (Moravian Museum, Brno)

conviction to their work. Britten, in music never quite losing touch with tonality, provided a blend of intensity and austerity, and penetrated remarkable psychological depths in his obsessive study of vulnerable outsiders. Henze moved between social comment, or satire, and psychological exploration with an assurance matched by the supple adaptability of his musical language, more radical than Britten's and echoing both Berg and Stravinsky, while slavishly imitating neither. If one essential musical source for both Britten and Henze is Mahler, it is all the more striking that their works are, in the end, so different.

During the second half of the 20th century many countries maintained a special commitment to operas by local composers: Australia, Finland and, not least, the USA had particularly good records in this respect, as well as Germany and Britain. Relatively few of these works crossed national borders, save occasionally in recorded form, and, apart from Britten and Henze, only a handful of composers achieved a sustained international reputation through their stage works – Tippett, Berio, Ligeti and Adams among them. These names indicate that success in opera since 1945 has not simply been the consequence of pursuing a relatively familiar, traditional musical style. Philip Glass's *Einstein on the Beach* (1976) pioneered the use of minimalist techniques taken up by Adams and Louis Andriessen, among others, and the adaptability of the genre has extended to the breaching if not the decisive destruction of its domination by male composers. In Britain, for example, Judith Weir produced a particularly accomplished group of stage works, including *A Night at the Chinese Opera* (1987) and *Blond Eckbert* (1994).

6. MODERN DRAMA. While it might be argued that the easiest way for a composer to ensure performance for an opera is already to have achieved prominence in other genres, it is clear that many major 20th-century composers – Messiaen, with his single, relatively late work *Saint François d'Assise* (1983), is the great exception – attempted operas at a quite early stage of their careers. Michael Tippett is a striking case of a composer who believed so deeply in the special importance of the genre that he devoted six years (1946–52) to his first mature effort, *The Midsummer Marriage* (1955), even with little prospect of early performance. That work is particularly special in that, with its explicitly Jungian aura, it is difficult to imagine such a treatment before the age of modern psychology.

After his second opera, *King Priam* (1962), Tippett, no less strikingly than Berio (*Un re in ascolto*, 1984) and Ligeti (*Le Grand Macabre*, 1978; fig.28), preferred to create dramas which are penetrating if often oblique reflections on contemporary life, contemporary ways of thought, contemporary problems, even when presented in stylized rather than naturalistic fashion. Indeed, it seems difficult to deny that the most memorable operas of the years since 1970 have been either meditations on the perennial topic of the artist in the world (Peter Maxwell Davies's *Taverner*, 1972; Birtwistle's *The Mask of Orpheus*, 1986; or Stockhausen's seven-opera cycle *Licht*, launched in 1981 with *Donnerstag*), or morality plays about those aspects of life that psychology and modern history have brought most directly into question: and, in particular, the subject of social and political authority.

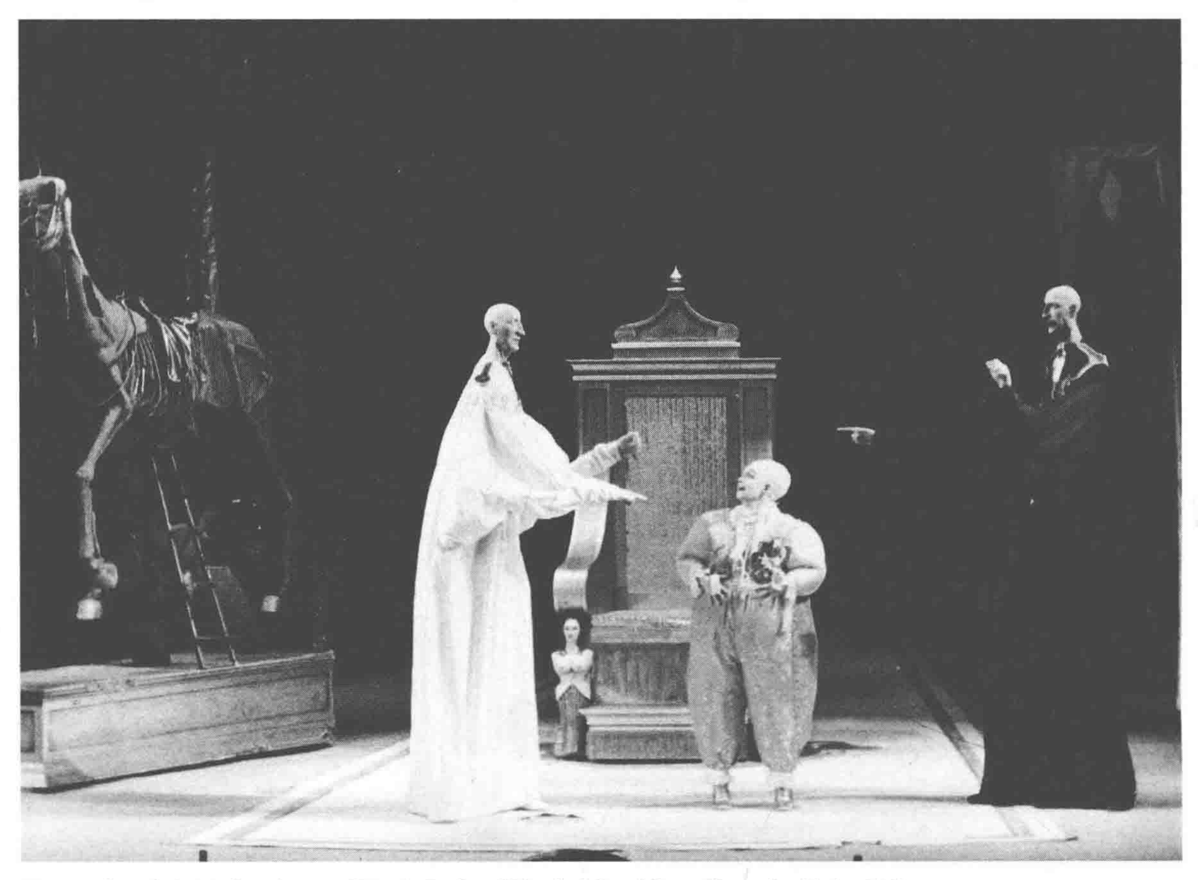


26. Closing scene of Act 1 of Weill's 'Aufstieg und Fall der Stadt Mahagonny', Neues Theater, Leipzig, 9 March 1930, with (centre) Marga Dannenberg as Leokadja Begbick

In a long and fruitful line whose specifically 20th-century strain can be traced from *Wozzeck*, the potential of representatives of the state for cruelty – despite occasional glimpses of more human sympathies – has been a theme ideally suited to the tensions and uneasy syntheses of modern musical language, and operas as different in style as Dallapiccola's *Il prigioniero*, Nono's *Intolleranza 1960* (1961), Bernd Alois Zimmermann's *Die Soldaten* (1965), John Adams's *The Death of Klinghoffer* (1991) and Maxwell Davies's *The Doctor of Myddfai* (1996) bear witness to that. This is not to suggest that all fantasy or comedy has been drained out of contemporary musical theatre, or that there is less generic flexibility in evidence than formerly. If anything, this flexibility is greater than ever since the example set by Weill in the Broadway musicals of his later years, and given that Leonard Bernstein was happy to write opera (*A Quiet Place*, 1983), musical (*West Side Story*, 1957) and 'comic operetta' (*Candide*, 1956). There may be little danger of confusing musicals with opera, whether they preserve spoken dialogue between numbers, like Stephen Sondheim's, or are through-composed, like Lloyd Webber's *Evita* (1978). Yet the application of the term 'rock opera' to the compositions of Lloyd Webber, or to a work like Stephen Schwartz's *Godspell* (1971), can be seen either as demonstrating strength through adaptability or as decadence through a change from sophistication to crudity. While an even better option might be to suggest that 'rock opera' has nothing to do with opera proper, it is dangerous to deny that opera can ever have a viably popular quality, especially in the light of the 20th-century operas in which young people and amateurs can be involved, from Menotti's *Amahl and the Night Visitors* (1951) and Britten's *Let's Make an Opera* (1949) and *Noye's Fludde* (1958) to Maxwell Davies's *The Two Fiddlers* (1978) and *Cinderella* (1980).

7. Chamber opera and music theatre. For many 20th-century composers, rejection of the large scale and elaborate resources of traditional opera was perceived as the best route to a more intense and focussed kind of dramatic expression. If Holst's *Sāvitri* was an early attempt at chamber opera, Schoenberg's *Pierrot lunaire* (1912) – first performed with its reciter in Pierrot costume and the instrumental quintet behind a curtain – was an early example of combining a chamber composition with an element of staging. This more explicitly hybrid enterprise, followed up as it was by Stravinsky's wartime theatre pieces and Walton's *Façade* (begun in 1921), explored possibilities of stylized and allusive dramatic presentation which were taken up with greater consistency and inventiveness after 1950.

Britten's commitment to chamber opera was manifest in the three church parables, *Curlew River* (1964), *The Burning Fiery Furnace* (1966) and *The Prodigal Son* (1968), each of which lasts about an hour and requires a



27. Peter Pears in the title role of Benjamin Britten's 'Peter Grimes', Sadler's Wells, London, 1945, with Leonard Thompson as the boy apprentice

performing group of at least a dozen (male) singers and eight instrumentalists. Another pair of works from the 1960s, Ligeti's *Aventures* and *Nouvelles aventures* (1966), is more typical of the time in its combination of expressionistically fragmented music and a surrealistic style of presentation. Music-theatre works by several of the most prominent younger composers are comparable to the Ligeti works in their challenging yet sharply controlled and economically structured designs: these include Birtwistle's *Down by the Greenwood Side* (1969), Maxwell Davies's *Eight Songs for a Mad King* (1969), Henze's *Der langwierige Weg in die Wohnung der Natascha Ungeheuer* (1971) and Berio's *Recital I (for Cathy)* (1972). Although all these composers had also written full-size operas, and would write more, it was possible to imagine in the early 1970s that music theatre might supplant opera itself as the favoured medium of dramatic expression, at least for composers of a progressive turn of mind. That this soon proved not to be the case may have something to do with the extent to which music theatre could easily seem closer to the 'happenings' and multimedia events promoted by experimental composers, especially John Cage, than to more mainstream music drama: the co-existence of contrasts provided a more practical way forward than the kind of progress in which the new completely obliterates the old.

8. Operas about opera. The capacity of operas to contain elements of self-reference – by using actors or opera singers as characters, or the writing or performance of opera as a subject – has been evident since Mozart's *Der Schauspieldirektor* (1786). Richard Strauss made significant 20th-century contributions in *Ariadne auf Naxos* and *Capriccio* (1942), while Britten, in *Let's Make an Opera*, contrived a simple yet lively way of involving audiences with a mixture of adult and child singers in rehearsing and performing an 'entertainment for young people', *The Little Sweep*.

At the other extreme, operas about opera moved into the surreal regions of John Cage's series of five works each called *Europera* (1985–91), a 'homage to the genre' which, at the same time, is a deconstruction of it. In these works Cage applied his characteristic chance operations to existing operatic materials, so that the singers perform 18th- and 19th-century arias for specified periods while the instrumentalists play operatic music that is likely to be quite different, and costumes, sets and all other aspects of production – even the programme synopses – are randomly selected.

Cage's enterprise in the *Europeras*, like other comparable experiments, such as Kagel's *Staatstheater* (1971), can be regarded as an extension of the kind of surrealistic attitude to the genre's traditional subject matter and formal principles found in Virgil Thomson's *Four Saints in Three Acts* (1934) and Poulenc's *Les mamelles de Tirésias* (1947). No less modernist in its aesthetic concept than Cage's work, though very different in musical character, is Berio's *Opera* (1970, rev. 1977). Here the title's literal meaning, 'works', is used to promote alternation of and interaction between three quite different stories, represented in turn by Striggio's libretto for Monteverdi's *Orfeo*, a Brecht-like treatment of the sinking of the Titanic, and materials from the Open Theatre of

28. Scene from the original production of Ligeti's 'Le Grand Macabre', Royal Opera House, Stockholm, 1978

New York's *Terminal*, a strong attack on the way in which terminally ill hospital patients are treated. If the topic of death ensures a common theme, the very different nature of the three types of material ensures that the structure as a whole is fluid and multivalent.

9. Opera and literature. *Opera* is neither Berio's most successful nor his most conventional work for the theatre: *Un re in ascolto* has a particularly rich and consistent musical character, serving to project a story which, like Tippett's *The Knot Garden* (1970), refers to Shakespeare's *Tempest* as one particularly effective way of declaring solidarity with the longstanding tradition of theatre as a magical, transcendent enterprise. Operas embodying such allusions seem to have achieved greater artistic success in the later 20th century than those more directly based on great works of literature, though even here the level of achievement varies: Samuel Barber's *Antony and Cleopatra* (1966, rev. 1974) was more widely admired on revision than in its original version, while Aribert Reimann's *Lear* (1978) has a powerful impact, even if of necessity (it is set in German) it is far removed from the full, elaborate rhetoric of the Shakespearean original. By contrast, Dallapiccola's *Ulisse* (1968) seems too deeply in awe of its Homeric source, while Iain Hamilton's *Anna Karenina* (1981) appears merely parasitic in the sense that, like many television adaptations of major literary texts, only the bare bones of plot and character are preserved; perhaps because the music has little of the strong sense of contemporaneity found in the original novel, the result is more a trivialization than an enhancement of the original. Such failures at least invite a more positive appreciation of more successful adaptations, from Prokofiev's *War and Peace* (begun 1941, completed 1953) to Henze's *Der Prinz von Homburg* and *The Bassarids* (fig.29) and Britten's *Death in Venice*, where the intensity and personal identity of the music enable a good deal of the stature, if not the actual style, of the literary sources to be preserved. Among younger composers contributing to the operatic canon, none has shown a stronger or more inventive commitment to adaptations of major dramatic sources than Wolfgang Rihm: his works include *Die Hamletmaschine* (1987), a fantasy using Shakespeare as its starting-point, and *Oedipus* (also 1987), which similarly places its Sophoclean topic within a context of more modern commentary. Alfred Schnittke contributed to the long list of operas based on the Faust story, in his *Historia von D. Johann Fausten* (composed 1983–94).

10. Conclusions. Musical life in the 20th century involved an intricate interaction between old and new, progressive and conservative. Opera houses that were built, and rebuilt, reflect 20th-century principles of design and use specifically 20th-century materials, but at the same time represent concepts of the role of musical composition and performance within society that are not fundamentally different from what they were before 1900. The rebuilding of the Vienna Staatsoper after 1945 was one particular prominent example signifying a deep-rooted belief in the continuing vitality of opera as an institution not requiring radical rethinking in the light of

29. Scene from the original production of Hans Werner Henze's 'The Bassarids', Grosses Festspielhaus, Salzburg, 1966, designed by Filippo Sanjust, with Kerstin Meyer as Agave

changing social and cultural conditions. New or newly restored opera houses were not primarily intended for the performance of 20th-century operas. For most operatic administrations, experiment was focussed less on challenging new works than on encouraging radical productions of operas from the standard repertory; and touring organizations, which do not depend on a large, fixed establishment, performing instead in a variety of non-standard venues, preferred slimmed-down versions of *Le nozze di Figaro*, *Carmen*, *La traviata*, even *The Ring*, to new or neglected 20th-century works. The engagement of opera with the 20th-century mass-media of radio and television was no less tangential, and even operas dealing very directly with contemporary subject matter, such as John Adams's *Nixon in China* (1987), tended to be conceived with the traditional resources of the old-style opera house in mind. (*See* TELEVISION, §IV.)

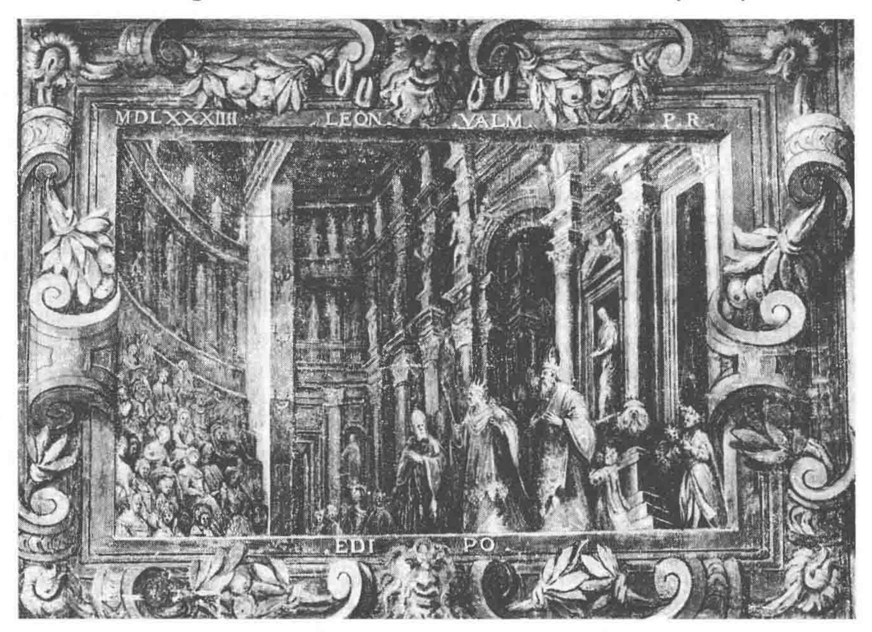
Because several of the most popular operas – *Madama Butterfly* and *Der Rosenkavalier*, in particular – have been written since 1900, it is not strictly possible to categorize 20th-century opera as an entirely peripheral phenomenon. Yet with a few exceptions, of which *Wozzeck* is probably the most striking, operas using the 20th century's more progressive compositional techniques have not attracted regular performance in the theatre. Many have nevertheless achieved a certain permanence through issue on CD and video, and the reciprocal relationship between live and recorded performance, if it continues, is likely to play an important role in assisting the dissemination of the more experimental kinds of opera. In this respect such an enterprise as the issue in 1995 of a 1993 Salzburg Festival performance of Luigi Nono's 'tragedy for listening', *Prometeo* (1985), is especially significant.

Many of the finest opera composers of the 20th century successfully explored a notable variety of dramatic subjects. Since Strauss followed *Elektra* with *Der Rosenkavalier*, and Stravinsky moved (over a much longer period) from *Oedipus rex* to *The Rake's Progress*, Henze explored the very different worlds of *The English Cat* (1983) and *Das verratene Meer*, while Birtwistle relished the contrasts between *Gawain* (1991; fig.30) and *The Second Mrs Kong* (1994). Such contrasts show the adaptability of a consistent musical style, rather than an ability to transform style itself from one kind of opera to another, and that ability may be no less apparent in major composers (for example Puccini and Britten) in whom such wide contrasts of dramatic topic are less evident. This adaptability is one reason why opera, along with associated forms of music theatre, may have a healthy future. If, as seems conceivable, music in the 21st century pursues a kind of classicism that attempts to integrate elements that 20th-century modernism sought to keep separate, then opera is no less likely to benefit from the development than other traditional genres which, despite all the odds, have survived the great 20th-century experiment.

VII. Production

1. 17th-century Italy. 2. France from Lully to Rameau. 3. *Opera seria*. 4. Enlightenment tendencies. 5. From Weber to Verdi. 6. Wagner and after. 7. Since World War II.

1. 17TH-CENTURY ITALY. Although Italian opera was a brand new form in the decade 1598–1608, it was able, where matters of production and staging were concerned, to draw on many established 16th-century procedures. Indeed, only one expertise had to be newly created for it: the ability of a leading singer-actor to sustain a single role through several operatic acts. With that exception – a significant one, as the future of opera was to prove – the skills required for the staging of opera were available for borrowing and adaptation from earlier musical and/or theatrical forms. 'Dramatic' presentation of solo song involving face-play, gesture and bodily movement; deployment on stage of singing choruses and *comparse* (silent supernumeraries); the mounting of elaborate sung-and-danced 'production numbers'; the use of oil- and candle-lit changeable scenery (pastoral and urban); the revelation of hells and heavens and the flyings about the



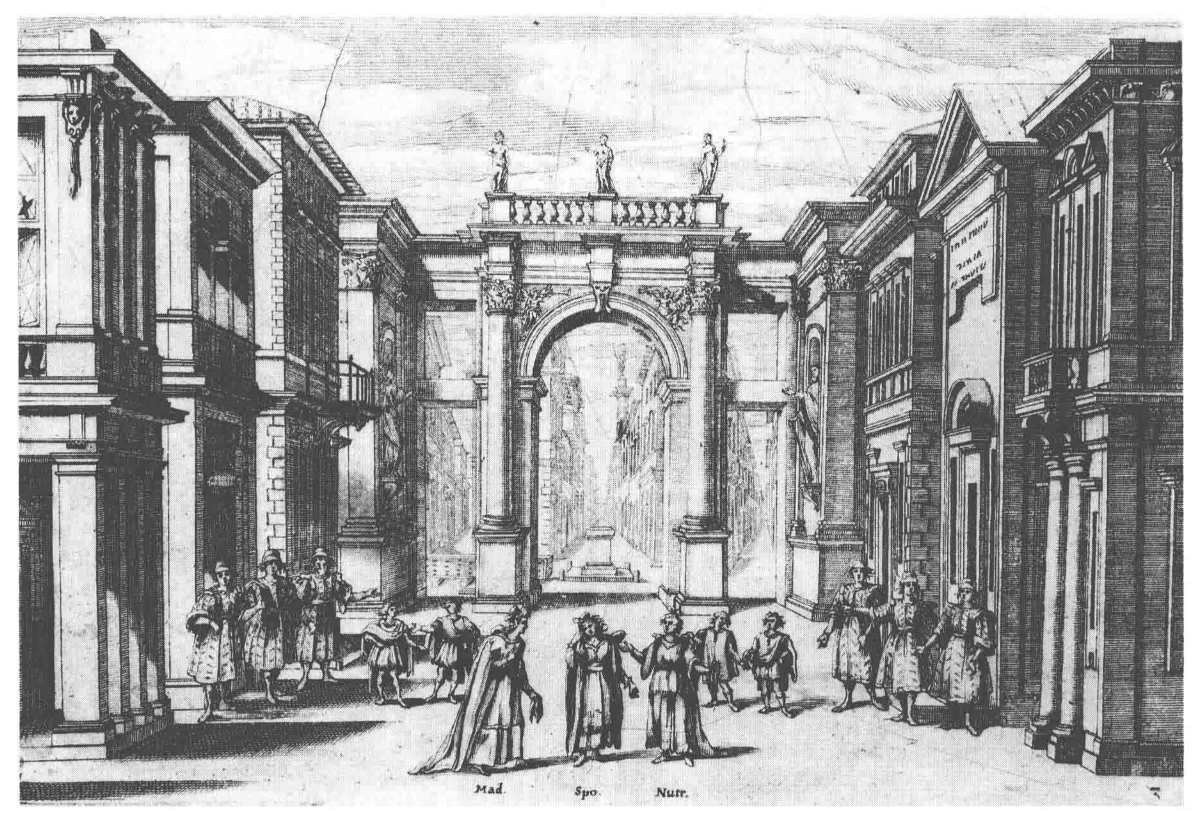
30. Entrance of the Green Knight (John Tomlinson) from Act 1 of Harrison Birtwistle's 'Gawain', Royal Opera House, Covent Garden, 1991

stage of supernatural beings (their songs accompanied by instrumentalists who were cunningly hidden behind the scenes): all these were to be found in Cinquecento courtly music-making, in humanist essays in the staging of classical or neo-classical tragedy, comedy and satyr play-cum-pastoral, or in the spectacular musical *intermedi* sometimes set between the acts of spoken dramas (*see also* INTERMEDIO).

The exclusive court-connectedness of opera in its first 40 years provided a further reason for operatic staging's being able to slip fairly unobtrusively into existence. It inherited the general convention in Renaissance court theatricals that there was a more or less amiable co-existence between the experts responsible for different aspects of a show, under the exigent or indulgent eye of the local autocrat or 'academy', or of an executive nominee: such a figure as Leone de' Sommi or Angelo Ingegneri (both of whom wrote illuminating accounts of staging in the late 16th century that are relevant to the mounting of early opera), or like Emilio de' Cavalieri, who, having been involved practically with *intermedio* and pastoral comedy in the 1580s and 90s, ghosted a preface on the singing and staging of his own operatic *Rappresentatione di Anima, et di Corpo* in 1600. It is in the tradition of such hands-on activity and treatise writing that the composer Marco da Gagliano printed an introduction to his *Dafne* (1608) which makes detailed but undogmatic suggestions about that opera's staging, and an anonymous Florentine around 1630 wrote *Il corago* – an extended job description and handbook for the *corago*, who is a courtly master of theatrical revels (including opera) and unites the roles, later to be separated, of impresario, intendant, drama teacher, director and stage manager.

It is clear from such treatises as these that true acting (as the Renaissance understood it) was required from opera singers, not mere standing and warbling: that a performer's facial play and seemingly natural movement about the stage should embody the meaning of the libretto, and that specifically operatic techniques – slowing down of gestures so that they last the full length of the sung phrase, movement during ritornellos rather than while singing – were thought to be additions to, not substitutes for, serious attention to the eloquent, expressive and lucid presentation of character out towards the audience that was required of spoken acting. The *comparse* and the chorus (when there was one) needed to be equally attentive: the *comparse* learning the elaborate battles devised for them by a master of fencing and gracefully filling stage space granted them by the principals in ceremonial scenes; the chorus respectful and responsive to the principals, its movements carefully synchronized but avoiding any sense of a regimented *corps de ballet*. Behind these, the symmetrical scenery, made more easily

31. Sophocles' 'Oedipus tyrannus' (choruses set by Andrea Gabrieli) as staged by Angelo Ingegneri for the inauguration of Palladio's Teatro Olimpico, Vicenza, 1585; fresco in the ante-odeon of the Teatro Olimpico



32. Marco da Gagliano's 'La regina Sant' Orsola', Act 2 (the battle between the Romans and the Huns at Cologne), Palazzo degli Uffizi, Florence, 1624, as directed by the dancing-master Agniolo Ricci; etching by Alfonso Parigi after the design by Giulio Parigi

changeable in the early 17th century by the introduction of sliding wing flats (but best kept at a distance by performers, wherever possible, for fear of showing up the flat-painter's radical foreshortening of perspective); and above them, the supernatural machines which, it was stressed, had to be moved at a tempo that harmonized with the music and did not discommode any performer who had to sing while riding on them.

The expansion of operatic activity from the later 1630s onwards to include the public and commercial had its shop window in Venice, where paying citizens could see features of production that had been hidden behind princely doors in Florence, Mantua or Rome. Accounts of the Venetian *Andromeda* (1637) and *Bellerofonte* (1642), for instance, celebrate their stylish acting and glittering costumes, their crowds of well-dressed, well-drilled *comparse*, their frighteningly realistic monsters and sophisticated dance interludes, their spectacular machine apotheoses and their smooth changes of scene before the audience's eyes: the décor of *Bellerofonte* was by the inventive and influential scenographer Giacomo Torelli. For the next 40 years, from Naples to Vienna and beyond, commercial, courtly and academic Italian opera was to develop a wide spectrum of scale and finesse in performance, from the productions of small companies touring the Italian cities much in the manner of the popular itinerant *commedia dell'arte* troupes to grandiose and prestigious events like Cesti's *Il pomo d'oro* at Vienna in 1668 (see fig.6 above), where the 24 souvenir engravings of Ludovico Burnacini's sets during performance vividly illustrate the culmination of the 17th century's tendency to impose a strong axial symmetry on performers as well as on scenery. Yet an integrated approach to acting in opera – and one the author of *Il corago* would have approved – probably continued in favour well beyond the middle of the century. Even the progressive increase in the length, complexity and potential for vocal display of the operatic aria did not remove the concept of sheer acting skill as a desideratum in the new species of opera star. For instance, in his *Dell'arte rappresentativa* (1699), Andrea Perrucci is as insistent as his forebears on the expressive use in sung as well as in spoken drama of head, eyes, arms and body (deriving much of what he says from the teachings of classical rhetoric) and on a clear frontal presentation of character. In discussing a particular phobia of his – collisions between actors making entrances and those leaving the stage – he suggests that a good way of avoiding these, with entrances from behind an upstage flat and exits as close as possible to the proscenium arch, would be of special value to the opera singer, who can thus leave from the front of the stage (where the light is strongest and contact with the pit band easiest) just after an aria. With *opera seria* and its proliferation of exit arias just coming on stream, this is advice that would have decades of relevance.

2. France from Lully to Rameau. Though the librettist of a new Italian piece may have had a considerable say as to its staging, in person or through the stage directions he was able to broadcast over his text, mid- and late 17th-century Italian opera seems not in the main to have been wedded to production practices that required

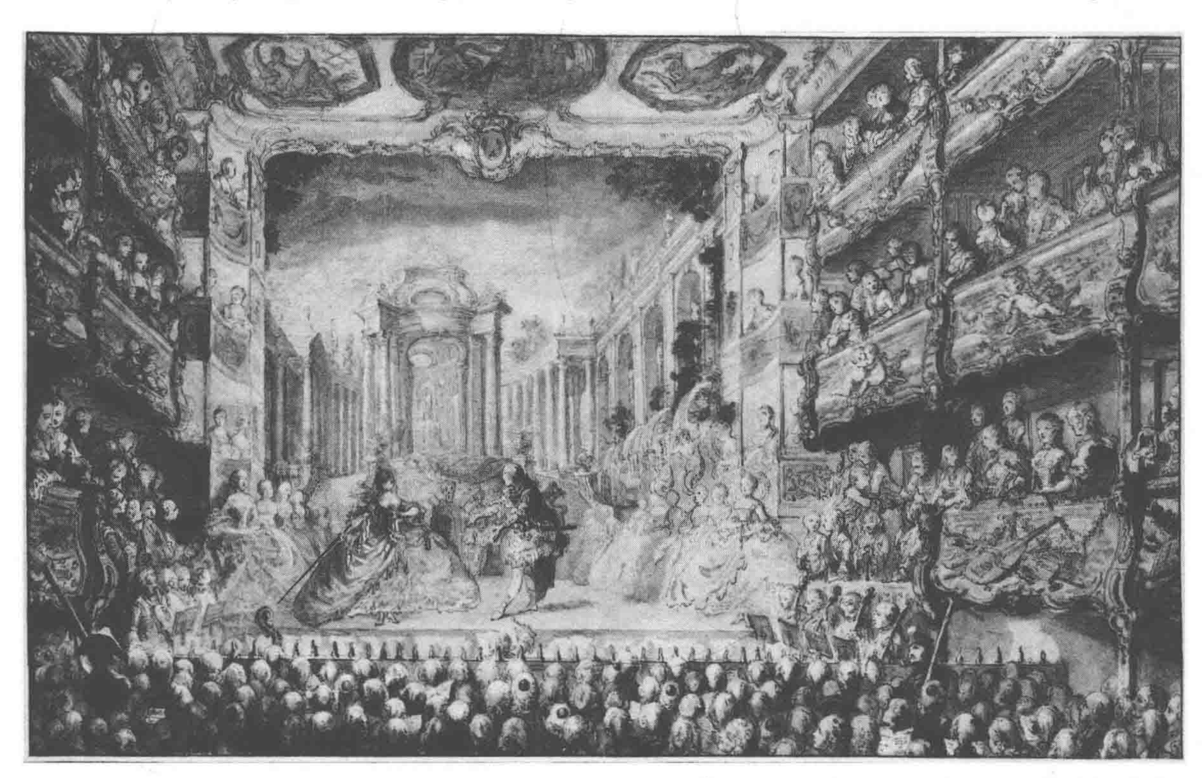
33. Scene from Act 1 of Stefano Landi's 'Il Sant'Alessio', revival at the Palazzo Barberini alle Quattro Fontane, Rome, 1634: engraving by François Collignon after the design variously ascribed to Pietro da Cortona, Francesco Buonamici and Gianlorenzo Bernini; Alexis's wife is placed down centre, flanked by his mother and nurse, and backed by a symmetrical arrangement of supernumeraries (the 'comparse')

firm, centralized directorial control; but in the 1670s and 80s they ordered things differently in France. There, Lully's reign over the French opera he had virtually created shows directorial presence at its most absolutist, working (probably not coincidentally) in the service of the arch-absolutist Louis XIV. In establishing *tragédie en musique*, Lully was clearly concerned that its staging should not suffer in comparison with that of the spoken comedy and tragedy that was then having such a golden age in France; so this hands-on composer-dancer-violinist-*corago* thought it best to have a direct say in everything (though in matters of design there were major delegations to significant figures, for example Carlo Vigarani and Jean Berain). Lully instructed his casts in person as to entrances and exits, moves and deportment, sometimes showing a performer every gesture of his or her role or demonstrating the pantomimic parts of the inset ballets. His mastery of the local details as well as the complex wholes of his operas in conception and in staging, his having their scores printed and (in effect) copyrighted, his arranging for uncut revivals and his personal training of a generation of actor-singers to perform them: all this led to Lullian opera becoming an influential national institution, and to Lully himself posthumously becoming a potent directorial phantom at the Opéra.

In the 18th century, French opera was more *galant* in mood and also more demanding vocally – provoking the remark ascribed to Rameau that, while Lully's operas needed actors, his own needed singers – but Lullian constructions and stage procedures were still pervasive. Operatic tradition went on setting great store by *le merveilleux*, which meant a greater emphasis on the vertical aspect of the stage – celestial descents, infernal trapdoors and the like – than was called for most of the time in the more 'historical' (and hence horizontal) Italian operas of the age. Then, true to that part of its origins that lay in *ballet de cour*, the tradition also insisted on the frequent incorporation into the action of dance sequences: hence the presence of a *corps de ballet*, which not only danced the symmetrical *fêtes* for the opera's principal characters but was also the resource for any troops of warriors, priests, genii or the like that might be required, in marked contrast to the non-dancing *comparse* who filled equivalent roles in Italian opera.

Another vital distinguishing feature of opera in Paris was its continuing commitment to a major role for a sizable chorus. The entry of the chorus at the Opéra in a *tragédie en musique* or an *opéra-ballet* was a spectacular moment: its richly dressed members advancing in two ranks, one from each side of the stage, to take up their places in an elegant U-formation. By framing the activities of principals, dance troupe and any active theatrical machines in this way, the chorus helped maintain a strong axial symmetry, which may partly explain the rarity on the French operatic stage (outside the work of Servandoni) of the skewed *scena per angolo* that was becoming a popular part of operatic décor elsewhere in Europe.

It is not clear whether in the early 18th century there was much active collaboration, beyond the necessary polite co-existence, between these operatic elements and departments. An at best benign convergence of the arts rather than an organic compounding of them seems to have been the rule. In the performance itself, principals sat graciously out of harm's way during the inset *fêtes*; the dancers tended to wear masks, which set them apart from other performers; and, once settled into its U-formation, the chorus seems rarely to have bestirred itself very much. Still, royal edicts which rationalized the company structure at the Opéra in 1713–14 provided for the appointment of two active administrative 'syndics' (later known as 'directeurs'); and making sure that there was at least a bare sufficiency of liaison must have been the responsibility of 'le syndic chargé de la régie du théâtre'. This officer dealt with artistic planning and



34. Tapestry (probably from the Gobelins workshop) apparently depicting the 'Divertissement du sommeil' (the scene of good and evil dreams in the Cave of Sleep) during Act 3 of Lully's 'Atys', first performed before the king under Lully's direction at Saint Germain-en-Laye, 1676, with choreography by Pierre Beauchamps and designs by Jean Berain I (Schloss Charlottenburg, Berlin)

casting (in consultation with the composer, if still living) and nominally oversaw all rehearsals and performances. It is a moot point how far his role in the staging of an opera was a creative and how far a purely diplomatic-administrative one; but it is clear that his drawing together of strands made for memorable performances at the Palais Royal. Reviewers would occasionally congratulate 'MM. les Directeurs' on brilliant and satisfying shows that excelled in words, music, casting, décor, costumes, choreography and execution. And individual performances could impress the most demanding critics. Even Rousseau, no lover of the opera as an institution, was impressed enough by the performances there of C.L.D. Chassé – he created several important bass-baritone roles for Rameau – to cite him in the *Encyclopédie* as everything a good operatic performer ought to be: never dropping his character to become merely a singer; forever interesting, even in silence; and conspiring by steps, looks and gestures to make his audience feel that the music rising from the orchestra pit was rising from his soul.

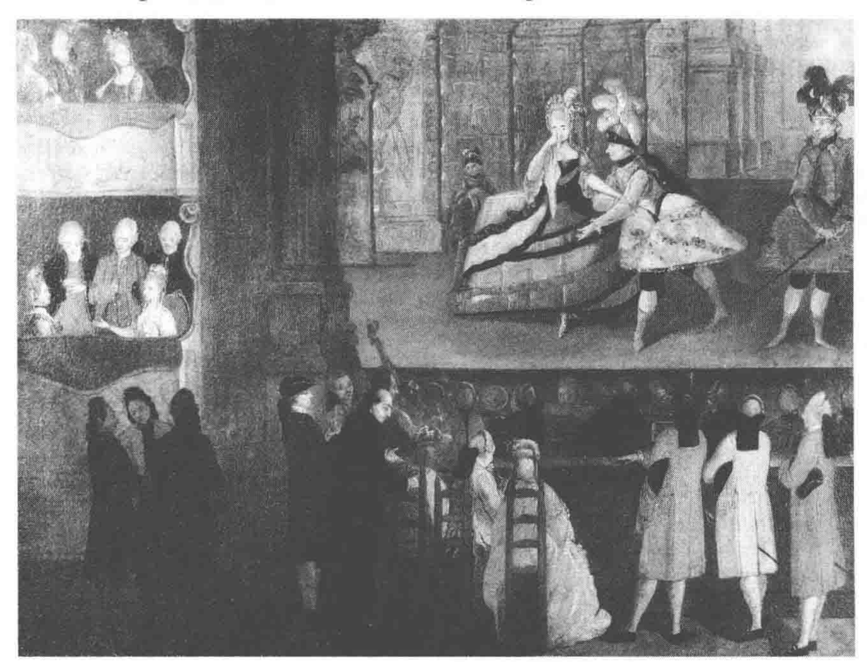
3. 'Opera seria'. In the Italian tradition as in the French, increasing emphasis was placed on sheer vocal expertise as *opera seria* established itself; and from this sprang the new tribe of Italian vocal virtuosos who had considerable success in the opera house for all that their acting abilities were fairly rudimentary. Yet the truly desirable opera singer was still generally deemed to be one who had (as an intendant of the royal opera in Lisbon in the 1760s put it) 'buona voce a grande estensione di corde, buona figure e buona azione'.

Once such performers were under contract, and provided they were not too fractious, the staging of *opera seria* was a relatively simple undertaking. The strong segmentation of the form allowed for discrete cells of activity. If there were ballets, battles or ceremonials to attend to, there was likely to be a *maître de danse* on hand (and perhaps an associated fencing master) to arrange them; a machinist could advise performers about any theatrical *coups* they might be involved in (descents of airy chariots, magical transformations, collapsing of city walls and the like); and a creative scenographer, or simply a resourceful scene-store keeper, would be ringing the changes on elaborate perspectives ('straight' or *per angolo*) which rendered a fairly limited range of motifs: palace, temple, street, harbour, cave, camp, garden, wilderness and so on. As for the principals working up the recitative-and-aria scenes of psychological interplay that are the staple of the *seria* form, their rehearsals of a new piece may quite possibly have been brief and not strongly directed, but need not be thought of as careless or primitive. For one thing, there were the stage directions of the libretto to be observed, not only for entrances and exits but often also for characters' moods and stage business. For another, performers could easily and independently apply to their recitatives the age's basic courtly stage deportment (a singer could find several primers in print for tragic acting in the spoken theatre, many of the techniques of which would apply equally well to opera). Again, since at the centre of *opera seria* was a spectrum of general emotions expressed one after another in a series of arias, an experienced performer coming to a new opera would almost certainly have given formal histrionic expression to all his or her character's feelings before – sometimes in exactly the same words (as multiple settings of successful librettos were common), sometimes even in the same music if the 'new' piece was

35. Confrontation of Armide and Renaud in the enchantress's palace garden in Act 5 of Lully's 'Armide', as revived by the Académie Royale de Musique (the 'Opéra') at the Palais Royal, Paris, 1747: watercolour with pen and ink by Gabriel de Saint-Aubin (Museum of Fine Arts, Boston)

a pasticcio. Stage performance of a *seria* aria seems to have been not unlike the 18th-century speaking actor's delivery of a tragic tirade or soliloquy.

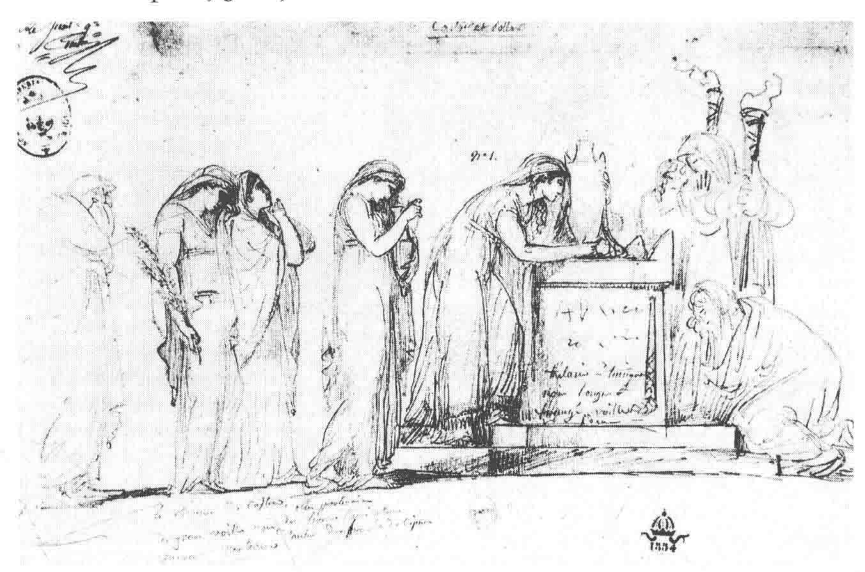
Hence a group of competent principals might achieve a fluent, decorous, pointed and telling staging of an *opera seria* (in all but any spectacular or balletic parts) with no more external help than was needful for recording which wings were used for which entrances, the assigning of courtly retinues of *comparse* and the resolution of any points of princely etiquette or clashes of artistic temperament. Sometimes the impresario or manager might provide such help, or the prompter or the *maestro di cappella* (who might anyway be the opera's composer). But most often it was the theatre's resident poet, in which case he might perhaps take on a more consequential, directorial role at rehearsals.



The comic ironies of Benedetto Marcello's *Il teatro alla moda* (D1720) carry the strong implication that a theatre poet worth his salt would explain the dramatic conception and intentions of his text to the performers in rehearsal, advise them on costume, gestures and the proper sides of the stage for their entrances and exits, and insist on a clear enunciation of his words. Later, Goldoni, who himself had had responsibility 'for directing and coaching the performers' during a stint as poet to a Venetian opera house in the 1730s, put such a figure into his comedy *L'impresario delle Smirne* (1761). There his Maccario, armed with the works of Zeno and Metastasio, some old plays and a rhyming dictionary, practises his specialities of writing new librettos, adapting old ones, fitting new words to old music, instructing the singers in acting, directing the scenes, attending the ladies to their boxes, looking after the *comparse* and blowing the traditional whistle for scene changes. Metastasio himself would have recognized at least some of this activity. Though it would not have been possible for him to rehearse all the settings of his librettos in person, his letters from Vienna to various sorts of theatre people from the 1730s to 50s show him to have been a careful director – concerned with the effective 'blocking' of scenes, making diagrams of the disposition of characters on stage, supplying detailed analyses of principal characters for composer and singer, offering suggestions for optional stage business over and above that in the printed text to busy intendants three or four countries away. Metastasio's letters also reveal that, however formalized the stage action may have been in *opera seria*, the genre's leading librettist was convinced that telling theatricality in the communication of feeling was the essence of its staging, not the blind following of formula or protocol.

4. Enlightenment tendencies. Though librettos of Metastasio went on being set and staged into the 1820s and occasionally beyond, by the 1760s more progressive spirits in writing and staging were entering a new age of sensibility, enlightenment, 'sublime simplicity' and growing concern for theatrical realism, the last partly expressed in a canonization of Shakespeare and a fresh respect for the arts of comedy. One aspect of this was the appeal that *buffo* acting came to have for serious opera lovers. The tiny, often two-person troupes performing farcical intermezzos between the acts of *opera seria* and the rather larger companies giving more extended *opere buffe* had developed a style of acting that was brisker, saltier and more immediately alluring, if not a great deal less governed by convention, than that seen in loftier opera. The unpretentiousness of this style and the leeway it gave for sharp observation of contemporary life endeared it to such observers as Arteaga and de Brosses, who saw its vivacity and 'air of truth' as rebukes to the traditional high operatic stage's tendency to what had come to seem stiffness and frigidity. At a time when David Garrick (the living demonstration that 'Shakespeare and Nature were the same') was shifting the norm of serious acting in spoken theatre away from weighty, slow-moving declamation towards a more energetic, pantomimic mode, it is likely that some of the more seemly aspects of *buffo* style, along with some Garrickian traits, were sharpening the

36. Demonstrations of Baroque acting from Franz Lang's 'Dissertatio de actione scenica' (Munich, 1727): (a) the proper placing of figures, arms and legs (Lang, a Bavarian Jesuit drama teacher or 'choragu', states, however, that the back should not be presented to the audience); (b) a properly managed stage entrance, with body and face immediately turned to the front so that in them the spectator can read the character's state of mind



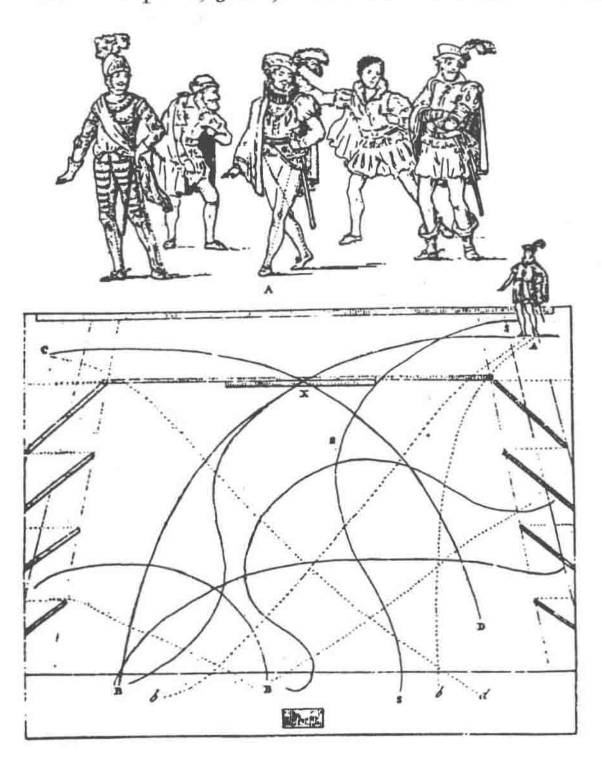
37. Performance in an Italian theatre, probably of an opera seria: painting by Giuseppe de Albertis, late 18th century (Museo Teatrale alla Scala, Milan); note the pageboy on stage holding the diva's train, and the seated gentleman in the pit holding a libretto

immediacy of serious operatic acting and increasing *its* air of truth.

Garrick was the model for several of the new men of operatic Europe in the mid-18th century, not least Noverre, for whom he was 'the Proteus of our time' and an inspiration behind Noverre's campaign to unmask the dancers in opera and so increase their histrionic potential. But if Garrick was a Proteus, it was the Gluck of the 'reform' operas who was seen by his admirers as the modern Prometheus where, *inter alia*, staging was concerned. One of them in the 1770s describes him as having to deal at first with principal singers whose acting was either lifeless or grotesquely mannered and with 'a collection of mannequins called a chorus'; but 'Prometheus shook his torch and the statues came to life', the principals realizing that the idiom of Gluck's music needed only to be felt to bring strong and true stage impersonation with it, while the chorus members in his operas were 'amazed to discover that they were actors'.

Garrick and Gluck, of course, were not alone responsible for all theatrical change at the time; but praise of this kind provides a frame for such things as the poet Verazi's stagings of his own librettos in the 1760s and 70s, noted for their treating the chorus 'as actors, not statues'; his printing his librettos with stage directions for elaborate business during the normally direction-free da capo arias; the increasing trouble taken by such composers as Jommelli to construct *buffo* ensembles which would permit 'natural' acting throughout; the growing tendency of the operatic stage space to be characterized by *chiaroscuro* in lighting, local colour in décor and asymmetry in the deployment of supernumeraries, dancers and scenery; the praises heaped on a singer like Sophie Arnould for her tenderness, energy, soul, sentiment and sensibility; and the determination of Gaetano Guadagni, who had learnt directly from Garrick and created the leading role in *Orfeo ed Euridice* (1762), to identify with his roles so fully that he refused to acknowledge applause after an aria or give encores.

Few singers may have gone as far as Guadagni in this; but his ideal chimes with a concept of opera involving a carefully monitored synthesis of theatrical arts, all blending together to present a heightened virtual actuality which will enthral, elevate and edify. The concept attracted support in the later 18th century, although there were differing views as to who should finally be responsible for the careful monitoring. Noverre and Algarotti, influentially urging this conscious integration of the arts as opposed to the traditional *laissez-faire*, both insisted that it was the poet-librettist who, as the begetter of the opera, should be the guardian of its wholeness, and that it was for the other theatre artists to embody the poet's unifying conception. Noverre further emphasized the need for the executive quintet of composer, designer, machinist, ballet-master and costumier to work closely together and for the poet to be on call throughout, which is what happened in the case of the team working on *Orfeo*. It was certainly an authority structure assured of some success in court theatres where the local prince himself was the librettist (or at least the influential drafter of scenarios). Elsewhere it might be the court composer, as with Jommelli at Stuttgart in the 1750s and 60s under the watchful eye of Duke Carl Eugen. According to Christian Schubart, Jommelli used his knowledge of singers, instrumentalists, audiences and theatre acoustics, plus the close cooperation of designers, machinists and choreographers, 'to move and uplift the coldest listener's heart and soul with one great totality'. Or it might be the court intendant for music and drama, as seems to have been the case with Count von Seeau at Munich in 1780–81 when Mozart and Varesco's *Idomeneo* was being prepared and rehearsed. Mozart's letters home suggest a careful collaboration under Seeau's control between composer, conductor, scenographer and choreographer. The lack of the librettist on the spot to advise singers about stage action suggests that the principals were expected to be largely self-reliant and to use appropriate modifications of well-tried *seria* and Gluckian techniques, taking advice

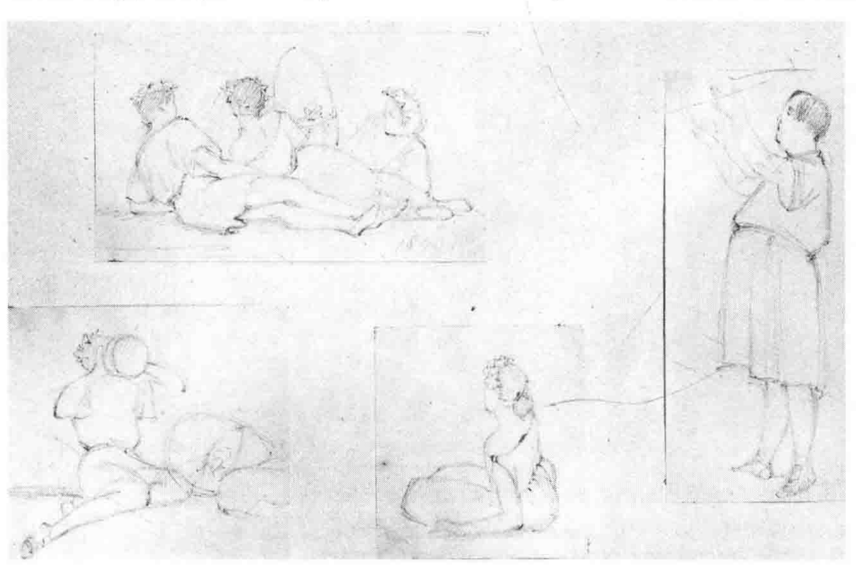


38. Obsequies at the tomb of Castor in Pierre Joseph Candeille's 'Castor et Pollux', Paris Opéra, 1791, as conceived by the production's costume designer, Jean-Simon Berthélemy: pen and ink (F-Pn)

where they found it. They would almost certainly have found it from Mozart in his role as composer-répétiteur, with his earnest concern that recitative should be fast-moving, spirited and fiery in performance, that singers should act, and that the most worthy criterion for librettists, composers and performers alike was theatrical effectiveness.

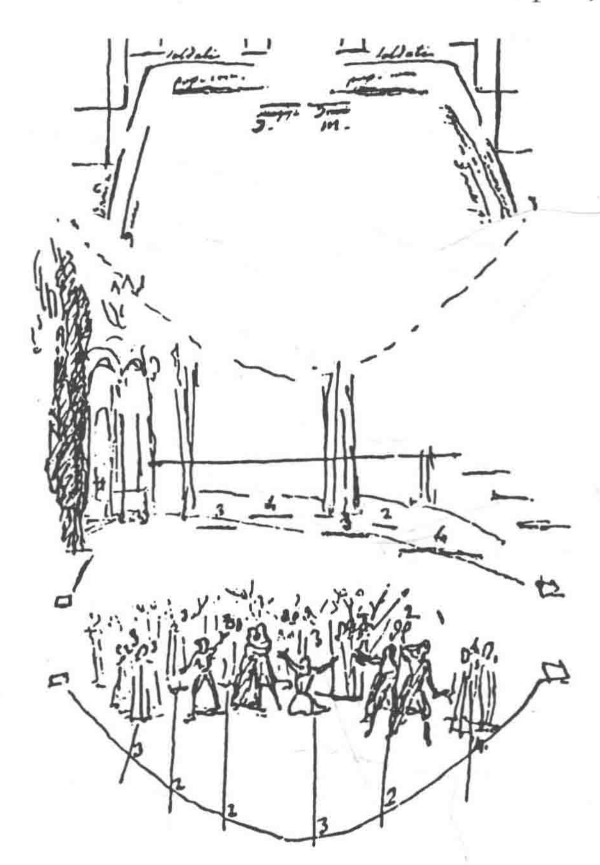
5. From Weber to Verdi. The idea of a 'great totality' of staging, integrated by one man, had a future. German-speaking theatre was allowing room in the 1790s for the notion of a 'Regisseur des Schauspiels' whose responsibilities included 'balancing all the individual details to create the overall effect'; and such ideas influenced influential operatic music directors, including Weber. As overseer of all aspects of vocal and visible activity on stage at the Prague Opera (1813–16), Weber conceived an ideal of a score and staging where 'every contribution of the related arts is moulded together in a certain way, dissolving to form a new world'; and at Dresden (1817–26) he was an advocate of the 'Leseprobe' (the early reading aloud by a company of the libretto to ensure that everyone involved had an idea of his or her place in the whole), was concerned to develop versatility in his soloists and acting ability in his chorus, and was minded to employ a 'literator' to discuss problematical aspects of librettos with performers and a dancing-master who would double

39. Backstage preparations for a revival of Mozart's 'Die Zauberflöte', Komödienhaus, Weimar, 1794, in an adaptation by Goethe's brother-in-law, C.A. Vulpius: watercolour by G.M. Kraus, director of the scenic workshop (Schloss Tiefurt, Weimar)



40. 'On Entering, Exiting and Walking upon the Stage', Lesson 2 from 'Theoretische lessen over de gesticulatie en mimiek' (1827) by the Dutch actor Johannes Jelgerhuis: (above) stage walking ('our walk on stage should be firm and bold'); (below) making entrances and exits (to perform these 'with decorum, that is, with grace and nobility, one must follow one of the continuous lines on the plan; to follow a dotted line is indecorous')

as a movement coach and also devise effective stage groupings.



Individualized, picturesque-romantic stagings came to appeal to other national operas around Europe too. For instance, William Charles Macready, the English actor-manager in spoken theatre, was concerned to take great and detailed care in embodying the dramatist's 'picture' on the stage, 'complete in its parts and harmoniously arranged as to figure, scene and action', and saw no reason why he should not apply the same techniques to staging opera in English. But the detailed itemization of stage action that appears in his prompt-books is hugely outdone across the English Channel by the quantity of movement, stage business and character revelation (to say nothing of matters of scenery, costumes and props) recorded behind the scenes at the Parisian *grands spectacles* of the age of Meyerbeer, Auber and Eugène Scribe, for use by stage managers, prompters, répétiteurs and the rehearsers of revivals. Staging almost for staging's sake – flamboyant Romantic-historical décor, crowd effects, exploitation of the new-fangled gas illumination – found itself in the foreground in French *grand opéra*. Of course, the sheer vocal and histrionic skills of such principals as Adolphe Nourrit and later Pauline Viardot were vital to an overall theatrical success; but there was so much else as well to claim the attention. So it is not surprising, given the need to keep some control over it all, that positions with the fairly interchangeable designations *régisseur de la mise en scène*, *directeur de la scène* and *metteur en scène* begin to appear in Parisian personnel lists.

The newly prominent French régisseurs were entrusted with the task of conniving with the operatic team – librettist, composer, company director, scenic artist, costume designer, choreographer and leading singers – so as to devise a durable staging of the latest score, and of making sure that the staging was adhered to during the run. Indeed, it was likely to be set in stone, to become virtually part of the work itself for Parisian revivals and productions in other places, through the régisseur's compilation of a sophisticated *livret de mise en scène*, which included a movement-by-movement, prop-by-prop account of the whole complex spectacle. These *livrets*, which evolved from less ambitious attempts in the 1800s to fix the stagings of Parisian melodramas and *opéras comiques* for the benefit of provincial managers, were often put into print; by 1850 over 80 of them had been published in Paris – distant, indirect descendants of the practical preface Gagliano had written for *Dafne* in 1608.

In Italian-speaking opera houses at the time there would have seemed to be little need for such *livrets*. Staging

41. Groupings of Sicilian nymphs and shepherds devised by William Charles Macready for his revival of Handel's 'Acis and Galatea', Theatre Royal, Drury Lane, London, 1842: sketches by John Tenniel from his 'Pencillings in the Pit

42. Sketches by Salvadore Cammarano for the staging of two incidents in one of his operas, possibly 'Merope', as set by Pacini, Teatro S Carlo, Naples, 1847

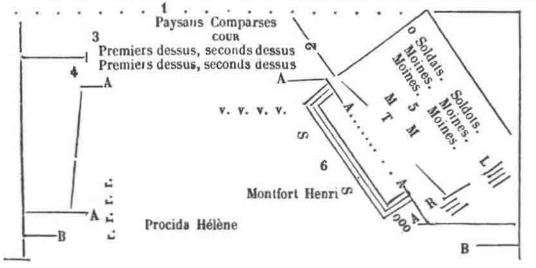
methods which would have been familiar to Goldoni were still being carried out more or less efficiently, and there are records of librettists such as Romani, Cammarano and Piave listing props, coaxing some acting out of singers, 'blocking' chorus scenes (where such existed), organizing *comparse* and troubleshooting backstage at premières. But as Italian opera, largely through the maturing of Verdi's genius, became theatrically more complex and hence more at risk after the première (which was artistically in the hands of the composer and his close colleagues) – especially when taken up by another company at a distance – a more rigorous means of quality control in staging was called for. If Verdi created the problem, however, he also had, indeed insisted on, a particular solution. Louis Palianti's series of Parisian *livrets de mise en scène* had included accounts of two productions of Verdi pieces with which the composer had been closely involved while in France in the 1850s. Passionately concerned to get and keep stage business right, Verdi was much taken with the *livret* idea. That for *Les vêpres siciliennes* was translated into Italian, and from then on each of Verdi's new operas had its own *disposizione scenica* prepared and printed by his publisher Ricordi with the composer's collaboration. By the end they were immensely elaborate; that for *Otello* (1887) – one for *Falstaff* has yet to be found – includes 270 diagrams of stage positions and moves (see fig.21). 'Because of recent developments in the music-drama, every movement has its *raison d'être* and the old stage conventions are no longer acceptable', says Ricordi in his epilogue to the *disposizione* for *Aida* (1872). He had no cause to ponder what the status of the prescribed décors and movements might be when operatic staging itself had developed still further.

6. Wagner and after. The story of modern opera production may well be seen as beginning with the first Bayreuth Festival of 1876. Not only was Wagner the prototype of the 20th-century director, but also the festival he inaugurated remained for over a century one of the chief power-houses of developments in dramaturgy. By contrast with the previous theatrical practice, where staging might depend on a combination of interested parties, Wagner, in collaboration with his choreographer Richard Fricke, imposed himself as the central intelligence. Strong emphasis was placed on the role of improvisation and inspiration in stage blocking. Traditional stock histrionics were replaced by 'natural' expression, and singers were encouraged to ignore the audience and respond only to fellow performers on the stage. This was the apogee of illusionism, the prevailing mode in the spoken theatre, at least, from the mid-18th century.

Montfort. — Henri. — Procida. — Hélène.

Après le solo de Procida : *Protégé de Montfort, à lui la honte, etc., etc.*, Hélène, qui a reculé de quelques pas, redescend à la gauche de Henri. *Oui, à nous la gloire ! à nous la mort ! à nous la mort !*—Après le *Ah !* vocalisé, pas général en avant en attaquant le FORTÉ quatre temps : *O noble patrie ! etc., etc.*

Messieurs, mesdames des chœurs, et masses comme ci-dessus.

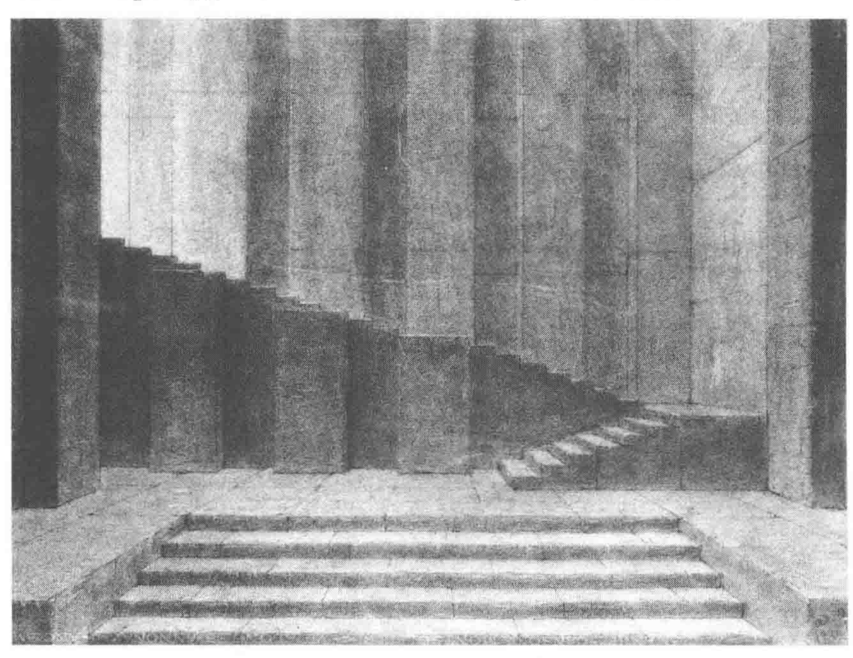


Vaudemont. — Béthune. — Montfort. — Henri. — Hélène. — Procida. — Mainfroid.

Depuis le changement de mouvement (ALLEGRO 6-8), Procida. Hélène, Mainfroid, Montfort et Henri reculent peu à peu. Dans ce mouvement, Procida se retrouve à la gauche d'Hélène.

Immédiatement après la dernière syllabe chantée, les mouvemens suivans s'exécutent très vite : — Une rue s'ouvre au milieu du théâtre. — Les soldats qui, au fond, sur la terrasse jardin, font face au public, descendent jusqu'au milieu du théâtre former l'aile gauche de la rue. Ils font alors face à leurs camarades qui occupent l'aile droite du théâtre, et qui ne bougent pas de place. — Henri veut s'élancer sur les pas de ses amis, qui le repoussent avec mépris. Vainement il se jette à leurs genoux. — Montfort seul le protège. — Tous les autres personnages qui également ont reculé de quelques pas, prennent part à l'action. — TABLEAU. — Le rideau baisse.

QUATRIÈME ACTE.



Grande pièce en pierres et à voûtes cintrées donnant sur la cour d'une forteresse.

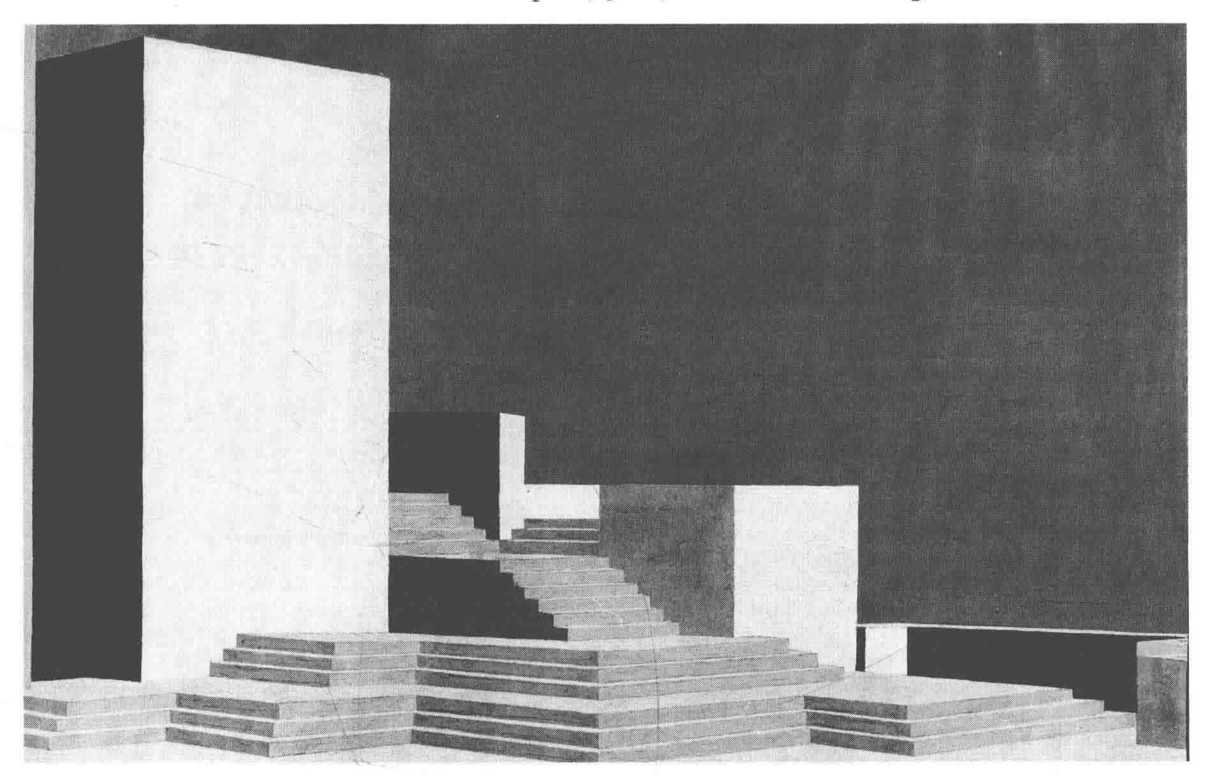
1. Rideau de fond tombant sur le quatrième plan. Il représente, entourée de hauts murs crénelés, une grande porte donnant accès sur des remparts crénelés, laissant voir la campagne. — 2. Châssis représentant une autre porte conduisant censé à d'autres cours. — 3. Porte conduisant au dehors. — 4. Issue conduisant au logement des prisonniers. — Les plafonds cintrés tombent de A à A. — 5. Pièce sombre, à laquelle on monte par quatre marches de pierre 6. — L'entrée cintrée est entièrement masquée par un rideau en tapisserie devant lequel se trouve une grille haute de deux mètres environ s'ouvrant en deux parties. — Au-dessus de l'ouverture de la pièce 5 sont suspendus quelques vieux drapeaux. — D'autres vieux drapeaux garnissent aussi le haut des murs côté jardin. — B. Manteau d'arlequin. (Les positions indiquées ci-dessus sont celles du commencement du final.)

Le rideau se lève neuf mesures avant le récit d'Henri.

43. Page from Palianti's livret de mise en scène based on the original production of Verdi's 'Les vêpres siciliennes', Paris Opéra, 1855; Palianti details the movements, groupings and pieces of stage business (all closely linked to specific verbal or musical cues in the score) leading to the big tableau at the end of Act 3: Henri torn between his conspirator friends and his long-lost autocratic father. The diagram, part of the subsequent design specification for Act 4 (the courtyard of a fortress), incorporates the positions to be taken by the cast at the beginning of that act's finale, to which the livret will soon give 750 words of detailed description

44. Set design by Adolphe Appia for Gluck's 'Orfeo ed Euridice', 1926

Wagner naturally took a keen interest in the work of Georg II, the Duke of Saxe-Meiningen, whose coincident innovations with his travelling troupe were a huge influence on the evolution of stagecraft. In Meiningen productions, scenery (three-dimensional, using the box set) was designed to accommodate the movements of actors; costumes, props and lighting were exploited to create mood and atmosphere. The duke also did much to establish the supremacy of the director.



When Cosima Wagner assumed control of the Bayreuth Festival after the composer's death, she brought a natural dramatic talent to bear and continued the progressive tendency of naturalistic acting she had observed at the first festivals. At the same time, her pursuit of an 'ideal' performance such as Wagner would have approved led to over-prescriptiveness and the stifling of inspiration.

Naturalism in acting and staging was also sought by Konstantin Stanislavsky, who in 1898 founded the Moscow Art Theatre with Vladimir Nemirovich-Danchenko. Recognizing that the representation of inner truth on the stage might involve an abandonment of realism, he sought to project life not as it is perceived in reality but as it is experienced 'in our dreams, our visions, our moments of spiritual uplift'. These principles, grounded in the system known as the 'Method' (based on the actor's personal experience and identification with the role), were embodied in Stanislavsky's work in the Bol'shoy Theatre Opera Studio, which he founded in 1918. Fusion of words, music and movement was the object, but it was the score rather than the libretto that was to provide the cues.

More revolutionary was the Moscow Art Theatre Musical Studio, founded in 1919 by Nemirovich-Danchenko, who rejected naturalism and realism in favour of the kind of techniques pioneered by Emile Jaques-Dalcroze, strictly synchronizing movement and gesture in abstract settings. Nemirovich-Danchenko, like many others, was influenced by the ideas of the Swiss designer Adolphe Appia, who has been described as 'the father of non-illusionist musical theatre'. Appia aimed to create a theatrical space independent of reality: a 'living background' that projected mood and atmosphere predominantly by imaginative lighting. His set designs were geometrical structures inspired by contemporary constructivist principles but offset by evocative deployment of light and shadow (fig.44). His theories of opera production, expounded in a series of essays, also proposed simple, stylized costumes and quasi-symbolic, non-realistic stage movements.

Similar ideas were espoused by the English theatre designer and director Edward Gordon Craig, but he also attempted to replace painted scenery with screens, variable in shape, size and colour according to the mood of the scene. His uncompromisingly anti-realist stance further led him to propose replacing actors altogether with 'über-Marionetten': puppets manipulated by an omnipotent director. In his notable productions for the Purcell Operatic Society, 1900–03, his rejection of traditional stage conventions and deployment of coloured light bore witness to the symbolist approach that was to make its effect felt on subsequent generations of directors. As with Appia, Craig's influence was chiefly through his theories rather than his productions. Appia mounted *Tristan und Isolde* at La Scala in 1923 and designed an austere, abstract *Das Rheingold* and *Die Walküre* in Basle, 1924–5 (the *Ring* thus initiated was abandoned, after vigorous protests); but his ideas were contemptuously dismissed by Cosima Wagner and not taken up seriously at Bayreuth until the reforming regime of Wieland and Wolfgang after World War II.

There were, however, other progressive spirits in the early decades of the century who followed Appia in rejecting pictorialism. Gustav Wunderwald's anti-naturalistic representation of the rocky heights in his *Rheingold* for the Deutsche Oper, Berlin, in 1914 showed an awareness of Appia's ideas, as did the work of Alfred Roller in Vienna, Hans Wildermann in Cologne, Dortmund and Düsseldorf, and Ludwig Sievert, whose *Ring* was first seen in Freiburg in 1912–13, then again, with some variations, in Baden-Baden (1917), Hanover (1925)

45. Design by Ewald Dülberg for Act 2 of Beethoven's 'Fidelio', Kroll Opera, Berlin, 1927: gouache (Institut für Theaterwissenschaft, University of Cologne)

and Frankfurt (1926–7). Sievert was able to introduce both a cyclorama (such as Appia had wanted but had been prevented from executing) and a revolving stage. The influence of Appia is also evident in the dark, suggestive, geometric shapes of Sievert's *Ring* designs (the rocky cleft in *Die Walküre*, Act 2, for example), though the slanting walls and converging perspective here produce a composition that was quite original and in turn widely imitated.

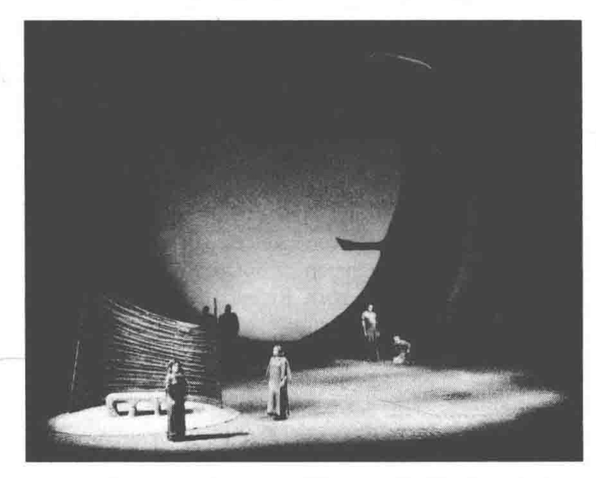
Roller's designs for Mahler's Wagner and Mozart productions in Vienna from 1903 onwards applied elements of neo-romanticism to architectonic structures derived from Appia and Craig. A more thorough-going avant-garde director was Vsevelod Meyerhold, whose determination to draw attention to the artifice and mechanics of the act of stage production foreshadowed Brechtian alienation techniques. Meyerhold's first opera production was an imaginatively reductive *Tristan und Isolde* at the Mariinsky Theatre in St Petersburg in 1909.

Another prominent director who gave practical expression to the theories of Appia and Craig was the Austrian Max Reinhardt, who played a key role in establishing the director/impresario in the opera house, and is best known for his collaborations with Richard Strauss and Hofmannsthal. Reinhardt's approach was an eclectic one, incorporating elements of realism, symbolism and Expressionism in an attempt to recapture in modern terms the visionary experience afforded by the traditional theatre. The accusation that his 'obtrusive' production method obscured the author's or composer's intention is an early example of the critical reaction against 'producer's opera'.

A new wave of realism, rooted in the anti-romantic, functional principles of the Bauhaus, informed the most stimulating experiment in opera production in the 1920s: the Berlin Kroll Opera under Klemperer (1927–31). The artist and stage designer Ewald Dülberg, who was responsible for productions there of *Fidelio* (fig.45), *Oedipus rex*, *Der fliegende Holländer* and *Rigoletto*, aimed primarily at creating clearly defined stage spaces, with starkly lit compositions drawing on principles of Cubist abstraction. Dülberg's costumes for *Das fliegende Holländer* (directed by Jürgen Fehling) were both modern and timeless – Senta sporting a blue pullover, grey skirt and a bright red wig – while the ships were represented as geometric shapes looming in the dark. From 1928 Dülberg's monopoly gave way to the participation of such artists as Caspar Neher, Traugott Müller, Oskar Strnad, Oskar Schlemmer and László Moholy-Nagy. In Moholy-Nagy's controversial *Les contes d'Hoffmann*, Romantic scenery was replaced by constructivist designs consisting of geometric and spiral motifs in the style of the Bauhaus; there were sharp contrasts of lighting, and the playing space was occupied by surreal puppet figures and the first steel furniture to appear on the operatic stage.

Meanwhile, at Bayreuth, Siegfried Wagner celebrated the reopening of the festival after the war (1924) with a sustained attempt, in his final six years, to introduce solid three-dimensional sets and other cautious innovations more in tune with the times. The hand of hallowed tradition weighed heavily, but in his last new production, *Tannhäuser* (1930), there was at last some evidence that the progressive ideas of contemporary music theatre were making headway.

46. Scene from Act 2 of Heinz Tietjen's production of Wagner's 'Die Walküre', Festspielhaus, Bayreuth, with designs by Emil Preetorius, production staged annually from 1933 to 1941



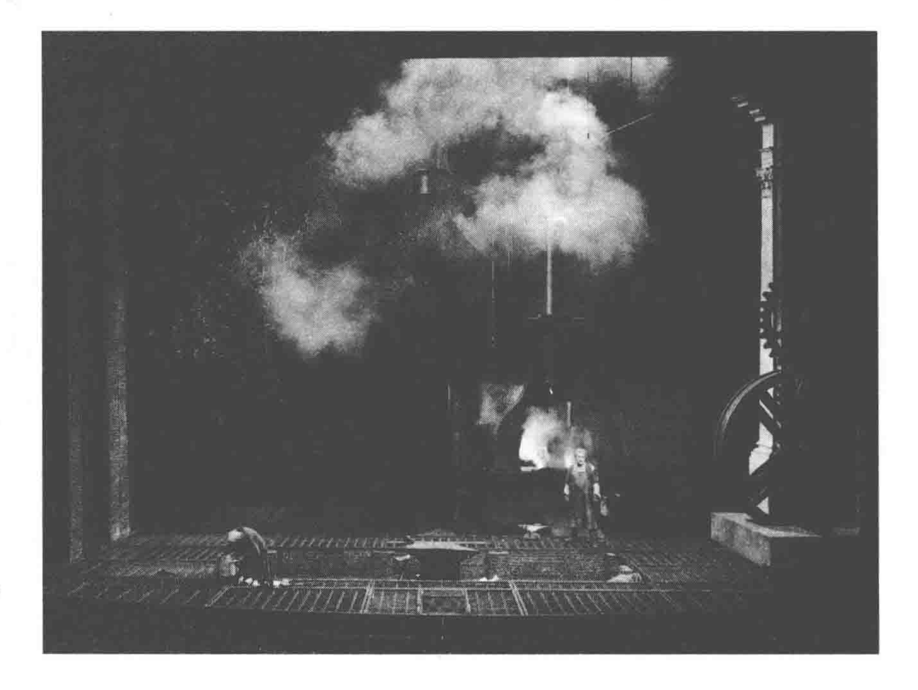
The ascendancy of the Nazis, however, put a stop to virtually all avant-garde experimentation in dramaturgy in Germany. Only at Bayreuth – ironically in view of the close links forged between the festival and the regime – was there any sign that creative thinking had been allowed to continue. Winifred Wagner's appointment of Heinz Tietjen as artistic director of the festival brought the scenic designer Emil Preetorius to the centre of attention (fig.46). In his essay 'Wagner: Bild und Vision', Preetorius drew attention both to the abundance of natural effects in Wagner's works and to their conception as allegories. On the one hand, he felt that these effects 'must be rendered clearly and with complete illusion'; on the other, he recognized that symbolism must play as important a role in the thinking of the designer as in that of the composer. Like Appia, he laid great emphasis on the use of lighting, allowing its deployment supremacy by reducing stage props to essentials.

At the Metropolitan, New York, at least one cycle of the *Ring* was conducted every year from 1929 to 1939 by Artur Bodanzky, using the faithfully naturalistic sets and bearskins of the Kautsky brothers first seen before World War I. The sets designed for the tetralogy after World War II by Lee Simonson also frequently sprouted foliage, but since Simonson was a Broadway designer, they had more than a touch of modernism as well, with echoes of Sievert and Preetorius.

7. Since World War II. The most radical shift in the staging of Wagner, and a key moment in the history of 20th-century opera production, occurred with the reopening of the Bayreuth Festspielhaus after World War II in 1951. Bayreuth had become indelibly associated with the Nazi regime, and it was in a conscious attempt to break with the ideology of the past that Wieland and Wolfgang Wagner, the composer's grandsons, discarded all the pictorial sets and their trappings that had become such an outdated fixture. Arguing that there was no incontrovertible reason why Wagner's works had to be given in the naturalistic mode in which they were first performed, Wieland reduced his sets to the bare essentials, essaying fidelity to the composer not on the surface but in terms of psychological truthfulness. The entire action was set on a circular platform or disc, and a cyclorama effectively suggested an endless horizon (fig.47). The stated aim was to reveal 'the purely human element stripped of all convention'. His abandonment of Wagner's specific instructions was justified by the drawing of a distinction between the stage directions, which remained bound to 19th-century theatrical modes, and the timeless ideas of the works themselves, which demand constantly new representations. The stage directions, in other words, he regarded as inner visions rather than practical demands.

A diametrically opposed set of dramaturgical principles was evident in the work of another hugely influential director of the same era, Walter Felsenstein. Having founded the Komische Oper in East Berlin in 1947, he remained its director until his death in 1975, establishing 'realistic music theatre' on the basis of long, intensive rehearsal periods and committed ensemble playing, but insisting that 'the central figure is, and remains, the singer-actor'. Felsenstein emphasized the creative contribution to be made by performers, inspiring them to replicate the psychological state of the characters they were playing, drawing on their own emotional reserves and experiences. The dramatic portrayals of characters and their interaction had to be persuasive, but Felsenstein also demanded that the act of singing in the theatre had itself to be experienced as a 'convincing, true and utterly indispensable mode of expression'.

Felsenstein's chief legacy was the psychological and social realism he brought to bear, and the emphasis he placed on role identification. His best-known pupils, Götz Friedrich (fig.48) and Joachim Herz, as well as such directors as Harry Kupfer, fused those principles with the



47. Scene from Act 1 of Wagner's 'Tristan und Isolde', Festspielhaus, Bayreuth, 1962, designed and directed by Wieland Wagner

48. Scene from Act 1 of Götz Friedrich's production of 'Siegfried', Covent Garden, London, 1975, designed by Josef Svoboda

quite contrary ones of Brechtian theory to establish the fundamentals of an approach that dominated the stages of Europe, in a variety of contrasting forms, throughout the 1960s, 70s and 80s. Brecht's determination to shatter the illusions constructed by traditional, 'culinary' theatre, as he disparagingly named it, led him to formulate the *Verfremdungseffekt*, usually rendered as 'alienation effect', though the intention was to alienate the audience from the action in order to engage it more immediately and intellectually.

Alienation techniques were used conspicuously by Friedrich in his two *Ring* cycles, where, for example, he caused Loge, Alberich and Wotan to step outside the framework of the drama to address the audience directly. Such techniques were used to heighten the contemporary relevance that became the hallmark of the work of Friedrich, Herz, Kupfer and other East German directors. Social and political commitment had been an intrinsic element of Felsenstein's productions too, but the incorporation of Brechtian techniques gave the work of the

49. Scene from Act 1 of Patrice Chéreau's production of 'Siegfried', Festspielhaus, Bayreuth, 1980 revival of the 1976 staging, designed by Richard Peduzzi

50. Scene from Act 2 of Franco Zeffirelli's production of Puccini's 'Turandot', Metropolitan Opera, New York, 1987

younger generation a sharper ideological edge. It was no doubt the potency of that ideological element that provoked bourgeois capitalist audiences and critics repeatedly to object to what was dismissed as socialist didacticism on the operatic stage – a stage, moreover, not traditionally associated with ideological engagement of any kind.

The Italian Giorgio Strehler and the Frenchman Patrice Chéreau (notably in his centenary production of the *Ring* at Bayreuth, 1976; fig.49) also attracted criticism in some quarters for the prominence they accorded to the ideological aspects of works. It is no coincidence that the trend they encouraged of directors turning from the spoken theatre to opera was concurrent with the rise of what came to be called, often pejoratively, 'producer's opera'. The age of the producer, or director (as he/she has come, following American usage, more commonly to be known), may be seen as a response to a set of sociocultural factors affecting the reception of opera in the modern era. Chief among these are the decline in the cult of the diva and, arguably, in the individuality of expression (though not technique) of singers; the passing of the era of the autocratic, charismatic conductor who fashioned the production in his own image; and the failure of opera in the 20th century to regenerate its forms or repertory in accordance with the needs of the age. The survival of an antiquated, obsolete genre has necessitated renewal in terms of presentation.

Not all 'interventionist' approaches have a political intention, however: some directors (notably Jonathan Miller) have probed the works from a psychological vantage-point, while others (notably David Freeman) have prioritized emotional directness. Present-day costumes and settings have sometimes, but by no means always, been the chosen means for such explorations. In the 1970s and 80s, some directors attempted to emphasize the universality and timeless relevance of works by incorporating props and costumes from various eras.

'Interventionist' opera productions have also gone hand in hand with the espousal of influential critical theories such as structuralism, post-structuralism (in particular deconstruction), reader-orientated approaches and feminism. The questioning of previous certainties such as the status of the author as the origin of the text, the source of its meaning and the principal authority for its interpretation effected a revolution in the way works, both classic and modern, might be presented. Brechtian theory had already suggested that the bourgeois theatre's illusion of reality could fruitfully be dispelled by disrupting the supposed organic unity of a work, emphasizing instead its discontinuities and contradictions. Now the wider possibilities of exploiting disjunctions between text and music, even of contriving them, and of generating creative tension between surface indicators in the score or stage directions and the action as played out on stage began to be realized.

Principles of this sort were initially most evident in the work of continental, primarily German, directors, though by the 1980s the torch had passed to the younger generation of directors active in Britain. Harry Kupfer had already created over 70 productions, mostly in East Germany, before he came to international attention in

1978; Patrice Chéreau's Bayreuth *Ring* (1976) was more immediately influential. The Gielen-Zehelein regime at Frankfurt (1977–87) produced a series of radical stagings by a team of guest directors including Ruth Berghaus, Alfred Kirchner, Christof Nel and Hans Neuenfels that pressed such ideas into the service of vibrant music theatre. Berghaus's stagings in particular, drawing also on surrealism and the Theatre of the Absurd, influenced the work of younger directors such as David Alden and Richard Jones. Others, such as David Pountney in Britain and Peter Sellars in the USA, ploughed their own furrows, in each case producing a corpus of work that by sheer force of conviction and flair in execution has often been well received even by those of a more traditionalist persuasion.

Alongside such radical developments, a conservative tradition has been maintained in various guises. Visconti's neo-romantic, picturesque opulence was continued by his protégé, Zeffirelli, notably at La Scala and the Metropolitan (fig.50), while 'fidelity to the text' has been the watchword both of those directors cleaving to the humanist, Leavisite tradition (Peter Hall is a prominent example) and, on the Continent, of those adhering to *werktreu* principles. It would be misleading, however, to suggest that either the mainstream traditional or the radical interventionist productions had a monopoly on invention and imagination. Peter Stein's *Otello* and *Falstaff*, for example, demonstrated that even a conventional concern for harmony of stage action and score can, in resourceful hands, have electrifying theatrical results.

The 1990s witnessed a backlash against iconoclastic productions, abetted on the one hand by critics and audiences who were never entirely comfortable with the interventionism of the 1970s and 80s, and on the other by a prevailing sense of ideological apathy and cultural malaise. The need, perceived by economically besieged managements, for surefire commercial successes is also a major contributory factor, and the eclecticism afforded by the aesthetics of postmodernism has allowed a wide variety of styles to be essayed with an exuberance and virtuosity that conceal an underlying conceptual vacuum. In general terms, with a few exceptions, the directors most in demand with the major opera houses have offered surface, design-led innovation rather than ideological engagement. Alfred Kirchner's Bayreuth *Ring* (1994–8) exemplifies the trend.

Shifts in public taste will no doubt continue to foster experimentation. In a postmodern age uncertain of its cultural identity, or of the role of opera in society, iconoclasm and traditionalism seem destined to co-exist, giving rise to a multiplicity of stylistic approaches for some time to come.

Opera America. American organization. Founded in Washington DC in 1970 as a non-profit-making organization, it offers a wide range of services, products and information to professional companies in North America and affiliated organizations outside the country, as well as to performers and administrators, the media, funding bodies and the public. Its publications include regular reports and surveys on the practical and financial aspects of performance, production and management, a directory of sets and costumes, a guide to competitions and young-artist programmes, and various educational materials. Opera America also organizes an annual conference and other meetings. Its website includes information on many of its activities, links to its member companies' websites and databases of performing artists, opera performances around the world and production materials available for hire.

MARTHA PERRY/LAURA YOUNG

Opéra-ballet (Fr). A genre of French lyric theatre, cultivated in the period following Lully's death in 1687. An *opéra-ballet* normally consists of a prologue and three or four acts (called entrées), each with its own set of characters and its own plot; the plot usually relates in a general way to a collective idea expressed in the overall title of the work, and each entrée includes at least one divertissement of songs and dances.

The first *opéra-ballet* is generally considered to be *L'Europe galante* by André Campra, to a libretto by A.H. de Lamotte, which was first performed at the Paris Opéra in 1697 (see illustration). Immediate structural models are Collasse's *Ballet des Saisons* (1695) and quite possibly the ballet *Les jeux à l'honneur de la victoire* (1691, music lost) by Elisabeth Jacquet de La Guerre (see Cessac, 1995).

The innovatory nature of *L'Europe galante*, however, lay less in its structure than in its subject matter. This was recognized by Cahusac, who wrote: 'In creating a completely new genre, Lamotte gained the advantage of being copied in turn . . . *L'Europe galante* is the first of our lyric works that bears no resemblance to the operas of Quinault' (1754, iii, 108–10). The key words 'completely new' and 'no resemblance to the operas of Quinault' refer to more than just formal structure. The *opéras-ballets* represent a musical parallel to the 'pretty Watteaus' of Cahusac's own happy image. The main contribution to the *opéra-ballet*, then, by Campra and his followers, Mouret and Montéclair, was the introduction of flesh-and-blood characters in recognizable, contemporary settings. Country *seigneurs*, *petits-maîtres*, elegant ladies and their amorous confidantes replaced the mythological and allegorical figures of the earlier ballets and *tragédies en musique*. 'L'opéra' from Campra's *Les fêtes vénitiennes* takes place in the Grimani Palace in Venice; 'Les âges rivaux', from his *Les âges*, is set in Hamburg; while Marseilles is the location of Mouret's 'La fille' from *Les fêtes ou Le triomphe de Thalie*. The libretto to this last tells us that this is the first opera in which female performers were 'habillées à la françoise'; and in the entrée 'La Provençale', added in 1722, Mouret introduced local costumes, local musical instruments and popular meridional tunes sung in Provençal dialect.

Beginning with *Les fêtes vénitiennes* (1710), comic intrigue was skilfully exploited in the *opéra-ballet*. *Les fêtes ou Le triomphe de Thalie* (1714) had a *succès de scandale* because of the humiliating defeat of Melpomene (muse of tragedy) by Thalia (muse of comedy) in its prologue, set on the stage of the Paris Opéra.

Harem of Sultan Zuliman, from the entrée 'La Turquie' in Campra's opéra-ballet 'L'Europe galante', Paris Opéra, 1697: engraving from the libretto in 'Recueil général des opéra', vi (1703)

There was also an increasing effort to mirror the social and cultural mores of court life during the declining years of Louis XIV and, after 1715, the Regency. Rémond de Saint-Mard clearly understood the appeal of *opéra-ballet* for a public grown weary of the heroic gestures of the *grand siècle*: 'We have reached the point, Monsieur, where one desires only [*opéras-*]ballets. . . . Each act must be composed of a fast-moving, light and, if you wish, a rather *galant* plot. . . . You will find there the portrait of our mores. They are, to be sure, rather vile [*vilaines*], but they are nonetheless ours' (1741, pp.94–6).

For the librettist P.-C. Roy, the *opéra-ballet* 'pleases by its variety and sympathizes with French impatience' (1749, ii, 18). Flexibility of format made it possible to add or subtract entrées on a trial and error basis. From June to December of 1710, for example, eight entrées had been composed for *Les fêtes vénitiennes*, making this *opéra-ballet* a most kaleidoscopic translation of 'French impatience'.

The 23 years between 1697 and 1719 may be said to constitute the 'first period' of the genre on the basis of subject matter and structure. The end of the Regency of

Philippe de Bourbon and the end of the first-period *opéra-ballet* followed closely upon one another. On 13 July 1723 the first performance of Collin de Blamont's *ballet-héroïque*, *Les festes grecques et romaines*, took place at the Paris Opéra. For the librettist, Fuzelier, this was a 'completely new type of ballet . . . that brought together all the best known Festivals of Antiquity, which appeared to be the most adaptable to the stage' (*Avertissement*). Various causes have been put forward for the sudden demise of the first-period *opéra-ballet*: the continuing opposition of many aestheticians to comedy on the French lyric stage; the return of a king (albeit a boy king) to the French throne; and the reversion by librettist and composer alike to the elusive tragic muse (Cahusac wrote that Lamotte believed that only *tragédie en musique* was 'worthy of his attention').

In any case, the *ballet-héroïque*, with all the trappings of monarchical opera, replaced the more frivolous earlier type. The fanciful characters, amorous ladies and lively *petits-maîtres* of the first-period *opéra-ballet* disappeared, to find a place in parodies, vaudevilles and the budding *opéra comique*. The structure of the *ballet-héroïque* is identical with that of the *opéra-ballet* – that is, three or four acts, each with its own plot; it may be thought of as a specific type of *opéra-ballet* that made up the second and final period of the genre.

By the time of Mouret's *Les amours des dieux* (1727), any pretence of avoiding a return to mythology was cast aside, although the *Avertissement* states that the work is 'absolutely in the heroic genre' in spite of its mythological characters. The rare use of comedy in the *ballet-héroïque* demands explanation: 'The public has decided that if Comedy is allowed on the stage, it may be only a noble Comedy that bears the character of Antiquity' (*Avertissement* to Destouches' *Les stratagèmes de l'amour*, 1726). The musical highpoint of the *ballet-héroïque* was reached in the examples by Rameau of which several are specifically called *ballets-héroïques*, among them *Les Indes galantes* (1735), *Les fêtes de Polymnie* (1745) and *Les fêtes de l'Hymen et de l'Amour* (1747). *Zaïs* (1748), which has a unified plot, is also described as a PASTORALE-HÉROÏQUE, a type of *ballet-héroïque* whose plot is generally concerned with the loves in an Arcadian setting between nobles or gods (or goddesses) and shepherdesses (or shepherds). The last *ballet-héroïque* performed at the Paris Opéra was E.J. Floquet's *L'union de l'Amour et des arts* (1773).

Single entrées from the more popular *opéras-ballets* and *ballets-héroïques* survived into the second half of the 18th century as parts of *fragments* (known also as 'spectacles coupés'), a curious genre in which a new production was formed from three or four acts picked arbitrarily from different *opéras-ballets*, one-act operas or *actes de ballet* (one-act ballets). Thus in 1759, 'Les devins de la Place St Marc' from *Les fêtes vénitiennes* formed part of a set of *fragments* that also included Rousseau's *Le devin du village* (1752) and *Ismène* (1747), an *acte de ballet* by Rebel and Francoeur.

JAMES R. ANTHONY

Opéra bouffe (Fr.). A mid- to late 19th-century French comic opera in which a witty spoken dialogue and sparkling, light music combine in a genre designed to entertain. Its period of greatest popularity coincided with the reign of Napoleon III. It takes its name from the theatre directed by Offenbach where many were first performed, the Théâtre des Bouffes-Parisiens (opened in 1855; *see* OPERETTA, fig.1). It differs from *opéra comique* of the same period in its more frankly humorous tone, often bordering on farce, and its use of parody and satire (literary, musical, social and sometimes political). The earliest example is Offenbach's own *Orphée aux enfers* (1858). For over two decades Offenbach continued to write *opéras bouffes*, some of which, like *La belle Hélène* (1864) and *La vie parisienne* (1866), have long outlasted

the society whose foibles were their targets. Among the most successful and prolific of his contemporaries and successors were Hervé (also a singer and theatre director) and Charles Lecocq, whose *La fille de Madame Angot* (1872) and several other works remain in the French light opera repertory.

M. ELIZABETH C. BARTLET

Opéra bouffon (Fr.). In 18th-century France the customary designation for Italian *opera buffa* performed in the original language or in French translation (for example, Paisiello's *Le roi Théodore à Venise*, a 1786 parody of *Il re Teodoro in Venezia*). It was also occasionally applied to *opéras comiques* whose plots were indebted to Italian or Spanish prototypes for characterizations or dramatic construction and, more broadly, to those in which the comedy approached farce (as in Philidor's *Blaise le savetier* of 1759 and Grétry's *Les deux avares* of 1770). A few contemporary writers, notably Contant d'Orville, used *opéra bouffon* as a synonym for *opéra comique*.

M. ELIZABETH C. BARTLET

Opera buffa (It.: 'comic opera'). The term 'opera buffa' was first applied to the genre of comic opera as it rose to popularity in Italy and abroad over the course of the 18th century. At first, 'opera buffa' did not appear as a designation in the librettos. Like 'opera seria', it was used in informal writings (letters, memoirs etc.) and in ordinary conversation, with reference to the spectacle as a whole. Librettists, even in the lowlier comic genre, had literary pretensions and accordingly entitled their work in ways that emphasized its status as literature. 'Dramma giocoso' occurs as early as 1695 (in G.C. Villifranchi's preface to his *L'ipocondriaco*, composer unknown, performed at the Villa Medici at Pratolino) and recurs sporadically thereafter, alternating from about 1740 with terms such as 'dramma bernesco', 'dramma comico', 'divertimento giocoso' and 'commedia per musica'. The last-named survived on an equal footing with 'dramma giocoso' from about 1760. The early Neapolitan-dialect librettos favoured 'commedeia pe' museca'. No special significance can be attached to any of these designations.

1. COMIC OPERA BEFORE THE 18TH CENTURY. A small number of comic operas were produced in the 17th century, although no great need for them can have been felt at a time when 'serious' operas were liberally interlaced with comic episodes. Comic opera had no conventions of its own at this time but on the whole tended to be modelled on the (spoken) *commedia erudita*. Both Villifranchi and his rather more famous predecessor at the Medici court, G.A. Moniglia, pointed to Terence as their model. Florence, indeed, could be said to have been the 'centre' of this 'erudite' type of comic opera: the inaugural work at the Teatro della Pergola in 1657 had been Moniglia's *dramma civile rusticale*, *Il potestà di Colognole*, set to music by Jacopo Melani. It was followed, at irregular intervals and at different public or Medici theatres, by a dozen more such works up to 1699, when there occurred a hiatus of nearly 20 years before the next comic production.

Rome had pioneered in this field with Giulio Rospigliosi's *Chi soffre speri* (1637 as *Il falcone*) and *Dal male il bene* (1653), the former based on a Boccaccio *novella*, the latter on a Spanish *comedia*, and so both, quite clearly, in the 'erudite' tradition. Bologna, too, witnessed some comic operas in the 17th century, several of them imported from Florence. Here the Inquisition inhibited the free growth of what might otherwise have been a truly popular genre: eight different indigenous *scherzi giocosi* are listed by Ricci for the period 1669–98, after which, as at Florence, no more comic operas were seen for some 20 years. It is perhaps no coincidence that Rome, Florence and Bologna were to become important stations in the spread of the 18th-century *opera buffa*, a more 'modern' genre whose true birthplace was Naples.

2. NEAPOLITAN 'OPERA BUFFA' TO *c*1730. It was at Naples that a new type of comic opera had its beginnings, patronized at first by eminent and, it would seem, enlightened members of the legal profession and aristocracy. The earliest known example is *La Cilla* (music by Michelangelo Faggioli, a lawyer, text by F.A. Tullio, later a prolific librettist), first performed in 1706 presumably at the home of the Neapolitan minister of justice to whom it was dedicated, then revived at the palace of the Prince of Chiusiano in 1707 and 1708. Only the libretto survives (no score from earlier than 1717 has been preserved, and no complete score earlier than 1722), but it, at least, is the very prototype of the kind of spectacle that was soon to thrive in the 'little theatres' of Naples: the setting is a district of the city itself, and the characters all speak in the local dialect. This lends an air of unadorned reality to what would otherwise have simply been the conventional characters and plot of an 'erudite' comedy. The *innamorati*, true to convention, are serious roles; but as they express themselves in the everyday dialect, their sentiments sound natural rather than stylized. Later Neapolitan comic operas often feature two pairs of lovers (the male lovers often portrayed by female sopranos) and the plot hinges on their fate. Surrounding them one finds such stock comedy figures as the old man, the old woman (a tenor role), the swaggering captain (bass) and the saucy shop boy (soprano). The local dialect and setting transmute all these traditional types from the caricatures they had been in earlier, Baroque comedy (both written and improvised) into more believable characters. Thus from the very beginning Neapolitan *opera buffa* reflects a new perception of everyday life; and from the very beginning

it deals with both serious and comic characters and situations. These traits remained characteristic of the genre even after it was divested of the local setting and dialect, and became cosmopolitan.

The Teatro dei Fiorentini, a century-old playhouse, became the earliest public theatre to house Neapolitan *opera buffa*. Its first offering, in October 1709, was *Patrò Calienno de la Costa*, with music by Antonio Orefice, words by 'Mercotellis' (a pen-name); this was soon followed by another dialect opera, *Lo spellecchia*, with music by Tommaso de Mauro, words by C. de Petris. According to one witness, a northern nobleman, Neapolitans now began to abandon the S Bartolomeo theatre, home of *opera seria*, preferring to fill 'the Teatro de' Fiorentini, which is presenting real trash [*una vera porcheria*], unworthy of being seen, in the Neapolitan language' (see Croce, 4/1947, p.140). Other theatres, the Nuovo and the Pace, opened their doors to *opera buffa* in 1724, by which time the new genre was a Neapolitan fixture attracting some of the best *opera seria* composers (Alessandro Scarlatti had tried his hand at it in 1718 with *Il trionfo dell'onore* at the Fiorentini, an unusual work in that the text was in Italian rather than Neapolitan, and the lovers were aristocrats). The new generation of composers – among them Vinci, Hasse and Pergolesi – were equally at home in both the serious and the comic genres.

The earliest singers were for the most part local and not professionally trained. Their music is accordingly relatively free of bravura passages but in other respects not unlike that of the contemporary *opera seria* (the arias are nearly all in da capo form). Like *opera seria*, these works are in three acts; Acts 1 and 2 often end with a short brawl for three or four of the cast, the germ of what later, in the north, was to become the extended *opera buffa* finale. The overtures, three-movement sinfonias, are indistinguishable from those of *opera seria*.

3. THE NORTH TO *c*1750. From Naples, *opera buffa* spread to Rome. Bernardo Saddumene, one of the leading Naples librettists, arrived there with some *buffo* singers and a composer (Giovanni Fischietti) in January 1729. Having recruited local castrato singers to play the female roles (women were not allowed on stage in Rome), he produced his *Li zite 'ngalera* (performed at Naples in 1722 to Vinci's music) under a new name, *La Costanza*, and with new music (by Fischietti). The serious roles were sung in Italian, the comic ones in the original dialect (a scheme that Saddumene later introduced to Naples, where it remained standard for the rest of the century). This and his *La somiglianza* (produced in February) appear to have been the earliest Neapolitan comic operas performed in Rome. The time was evidently ripe for the new genre to spread north. During the 1730s Rome became a centre of *opera buffa*; italianized Neapolitan operas as well as original Italian ones were produced there, principally at the Teatro Valle. Among the former, Gaetano Latilla's *La finta cameriera* (1738, known in Naples as *Il Gismondo*, 1737), among the latter Latilla's *Madama Ciana* (1738) and Rinaldo di Capua's *La commedia in commedia* (1738) and *La libertà nociva* (1740) formed the nucleus of Roman operas that soon began travelling north (one G. Barlocci is credited with having written or adapted their librettos). The composers, it should be noted, were at first all Neapolitans, while the singers tended to be native, often with previous experience as intermezzo specialists.

La finta cameriera travelled by the following route: Naples, 1737; Rome, 1738; Faenza and Modena, 1741; Siena, Florence, Genoa, 1742; Bologna, Venice, Vicenza, 1743; Milan, 1745; Turin, Mantua, Verona, Parma, 1747; and meanwhile, Graz, Leipzig, Hamburg, 1745 (carried there from Venice by the Mingotti troupe). The work's progress reflects fairly exactly the northward progress of the new *opera buffa*. There were early excursions outside Italy, and by the 1750s *opera buffa* was spreading to most of Europe.

4. THE LATER 18TH CENTURY. Venice quickly capitulated to the new genre. After the Teatro S Angelo produced *La finta cameriera* in May 1743, the S Moisè and S Cassiano theatres threw their doors open to *opera buffa*, remaining its chief purveyors until 1748, when other theatres joined in. The earliest composers were Latilla, Pietro Auletta, Rinaldo di Capua, Antonio Palella and Giuseppe Avossa, all Neapolitan. But in January 1745 they were joined by the Venetian Baldassare Galuppi, whose first *opera buffa*, *La forza d'amore*, was produced at the S Cassiano. Other northerners, Giuseppe Scolari and Ferdinando Bertoni, followed the next year; and yet another, Vincenzo Ciampi, made his Venetian *opera buffa* début in autumn 1748, having enlisted the aid of the then relatively unknown Carlo Goldoni. The Ciampi-Goldoni collaboration extended to two more works, but meanwhile Galuppi and Goldoni produced their first joint effort, *L'Arcadia in Brenta* (S Angelo, 14 May 1749), thereby initiating a new epoch in the history of the genre.

In a series of highly successful works, Galuppi and Goldoni established a model for the *opera buffa* just as it was beginning to rival the *opera seria* in popularity. It was a propitious moment, and several of the brilliant actor-singers at their disposal (e.g. Francesco Baglioni, Francesco Carattoli, Filippo Laschi, Serafina Penni) were to carry the new repertory far and wide, repeating their Venetian successes in other cities and countries. Notable among the new operas were *Il mondo della luna* (S Moisè, 1750), *La calamità de' cuori* (S Samuele, 1752), *Il filosofo di campagna* (S Samuele, 1754) and *La diavolessa* (S Samuele, 1755), all of which, but especially *Il filosofo di campagna* (see illustration), were to enjoy European fame (see *LoewenbergA*). Goldoni's spoken comedies were then in the ascendant, and his librettos were merely lucrative by-products; yet they are cleverly wrought, treat a wide variety of subjects from the realistic to the fanciful and (unlike his plays) are always rich in scenic effects. How much their musical component reflects Galuppi's wishes it is impossible to say, but the composer is given splendid opportunities with such standard features as opening ensembles, metrically varied arias (often departing from the da capo convention), a comic vocabulary designed for musical reiteration and, above all, 'chain' finales, of which, according to Gozzi, Goldoni was 'the first inventor'. A forerunner of this highly important innovation is already present in their *L'Arcadia in Brenta*; Act 2 ends with a play within the play, most of it set to music. In succeeding librettos, the finales to the first two acts, growing out of the plots themselves, become increasingly long and eventful, and Galuppi set them as a series of separate sections contrasted in key and tempo, assigning to the orchestra the task of continuing the music amid the hectic comings and goings of the actors onstage.

Galuppi's 'Il filosofo di campagna': engraving by G. Zuliani from Carlo Goldoni's 'Opere teatrali' (Venice: Zatta, 1788–95)

The importance of this new feature, which was hugely enjoyed by the public, lies in the fact that here, for the first time in opera, action, not just sentiment, was being set to music. This trend was to gain in importance in later years, affecting even *opera seria*. Act 3 normally closes with a simpler ensemble or chorus, but in the penultimate scene Goldoni introduces yet another convention: the duet of reconciliation between the two principals, patently a legacy from the now obsolescent intermezzo.

As early as 1749 (in *Il conte Caramella*, another Galuppi opera) Goldoni listed his characters under the headings 'seri', 'buffi' and 'mezzi caratteri', the last denoting something between 'serious' and 'comical'. He was not blazing new trails but merely codifying what doubtless was already theatrical jargon: the same categories would have been applicable to the earliest Neapolitan comic operas. And when he wrote *La buona figliuola* for the court of Parma in 1756 (the composer was Duni), he dispensed with those headings altogether. Yet this libretto, as reset in 1760 by Piccinni in Rome, is widely quoted by historians as marking a turning-point in the history of *opera buffa* because of its mixture of comedy with a sentimental, 'larmoyant' element. However, the opera's resounding success in Rome and throughout Europe cannot be ascribed to a formula that was in itself not at all new. Here again, a conjunction of work, place and time must be considered responsible: Piccinni undoubtedly struck just the right note in portraying the sufferings of Cecchina, the innocent heroine (played in Rome of course by a castrato) and Europe must have been ready just then to take such a heroine to its heart, having already embraced the heroines in novels (notably Richardson's *Pamela*, Cecchina's model) and in the French *comédie larmoyante*.

Despite the great success of *La buona figliuola*, Italian *opera buffa* did not develop farther along the lines of sentimentality. The sly observation of human foibles within the context of contemporary society was and remained its main business; and, precisely because of its success in this, *opera buffa* now became the dominant form, greatly reducing the role of *opera seria* everywhere. It successfully reflected the Zeitgeist and thus exerted a widespread influence, infusing with its spirit the new instrumental genres of the Classical period as well as the comedies of contemporary authors such as Goldsmith, Sheridan and Beaumarchais. Not the least of its effects was the stimulus it provided for the development of new, national forms of opera in countries other than Italy (e.g. *opéra comique*, Singspiel, zarzuela etc.).

With the rise in prestige of *opera buffa*, its history in the later 18th century becomes virtually that of opera in general and its composers. In Italy, the new composers were Anfossi, Francesco Bianchi, Cimarosa, Giuseppe Gazzaniga, P.A. Guglielmi, Paisiello and Sarti among countless others; the new librettists Giovanni Bertati, G.B. Lorenzi, Pasquale Mililotti, Giuseppe Palomba, Giuseppe

Petrosellini and others, among whom Bertati stands out as a talented innovatory man of the theatre. Some of the most important operas of this period were first performed in foreign capitals; for example Paisiello's *Il barbiere di Siviglia* (librettist unknown; 1782, St Petersburg) and *Il re Teodoro in Venezia* (G.B. Casti; 1784, Vienna); and Cimarosa's *Il matrimonio segreto* (Bertati; 1792, Vienna). Non-Italian composers, from Gassmann to Martín y Soler, became adept practitioners. It was left to one of them to crown the development of *opera buffa* in the 18th century with three enduring masterpieces. Mozart's *Le nozze di Figaro* (1786, Vienna), *Don Giovanni* (1787, Prague) and *Così fan tutte* (1790, Vienna), to librettos by Da Ponte (who, like Casti and some others, never wrote for Italy), may in some respects be regarded as characteristic of their time: their one-movement overture form and two- or four-act division, the proliferation in them of action set to music in numbers other than the finales proper, and the variety of aria forms (including the nascent cantabile-cabaletta type) were not his inventions. In their psychological depth, dramatic timing and technical mastery, however, Mozart's Italian comic operas stand alone, dwarfing their predecessors and reducing the prior history of the genre, in the perspective of later generations, to a period of preparation for his coming.

5. THE 19TH CENTURY. In the Romantic age the importance of *opera buffa* became vastly diminished. Here the forms are generally freer and less extended than in the serious genre and the set numbers are linked by *recitativo secco*, except in the solitary case of Donizetti's *Don Pasquale* (1843). With Rossini a standard distribution of four characters is reached: a prima donna soubrette (soprano or mezzo); a light, amorous tenor; a *basso cantante* or baritone capable of lyrical, mostly ironical expression; and a *basso buffo* whose vocal skills, largely confined to clear articulation and the ability to 'patter', must also extend to the baritone for the purposes of comic duets. The classic *opera buffa* of the early 19th century is Rossini's *Il barbiere di Siviglia* (1816, Rome), that of the Romantic age Donizetti's *L'elisir d'amore* (1832), in which the hero's silliness is tinged with pathos. Sometimes there is a second *basso buffo* and even a sub-heroine, as in Verdi's *Un giorno di regno* (1840). The last example of the genre to survive is Luigi and Federico Ricci's *Crispino e la comare* (1850), a morality which breaks with the Italian tradition by admitting an element of the supernatural (hence its description as 'opera comico-fantastica'). Backstage comedy persisted well into the 19th century, notable examples being Grecco's *La prova d'un opera seria* (1803), Donizetti's *Le convenienze teatrali* (1827) and Pedrotti's *Tutti in maschera* (1856). After 1860 *recitativo secco* was dropped from comic opera and with it the title of *opera buffa*, to be replaced by *dramma comico*.

Opéra comique (Fr.). Term for a French stage work of the 18th, 19th or 20th centuries with vocal and instrumental music and spoken dialogue (though it may also include recitative). Its origins are found in the 18th-century Parisian Fair Theatres (known from about 1715 as the Opéra-Comique) and also the Comédie-Italienne (*see* PARIS, §IV, 3 and THÉÂTRES DE LA FOIRE). The essentially popular appeal of these repertories formed the antithesis of the stately *tragédie mise en musique* and allied works at the Académie Royale de Musique (the Opéra). Soon, however, a broad range of subjects and styles was developed: *drame* and other literary and dramatic models became important. The word 'comique' should thus be broadly construed, in the spirit of Balzac's term 'la comédie humaine'.

1. TERMINOLOGY. The term first appears in current usage in the 18th century when, in the phrase 'opéra-comique en vaudevilles' (or similar expression), it designated stage works using pre-existing tunes and usually spoken dialogue (as in C.S. Favart's *L'amour au village*, 1745). Sometimes modified, for example by 'en ariettes et en vaudevilles', it was extended to works using a mixture of *timbres* (or traditional ditties) and newly composed *airs* (e.g. *La fausse aventurière*, libretto by Anseaume and P.A.L. de Marcouville, with additional music by Laruette, 1757). At this time it rarely designated *opéras comiques* in the modern sense.

In spite of inconsistencies in terminology among some theorists, critics and authors during the 1750s and 60s, the phrase *comédie mêlée d'ariettes* soon became the generally accepted designation during the *ancien régime* for the majority of what are now called *opéras comiques* (there are numerous examples in the output of Egidio Duni, Monsigny, F.-A.D. Philidor, Grétry and their contemporaries). 'Comédie' attests to the significance of certain literary norms in part judged by the standards of French spoken theatre, and 'mêlée d'ariettes' to the unique quality of the genre in which specially written music (mostly, though not exclusively, lighter *airs* for soloists was implied) had an increasingly significant role.

Other words or phrases also appear on the title-pages of librettos and scores or in contemporary descriptions.

Some point to additional literary models; others to subject matter ('féerie' for fairy stories, 'chevaleresque' for knightly or pseudo-medieval tales); still others to style or tone dominating the text and sometimes matched by the music (e.g. 'larmoyant' for sentimental comedies). M.-J. Sedaine (1764) was not alone in protesting that 'ariettes' could not effectively describe the range of music in the new genre: 'mêlée de musique' or 'mise en musique' became alternatives.

By the Revolution, 'comédie mêlée d'ariettes' declined in usage and was restricted, in the main, to lighter, old-fashioned works. 'Opéra comique' still almost always meant 'vaudeville'. Many librettists and composers sought greater precision: they continued to borrow terms from spoken theatre (as in 'comédie héroïque'), modifying the phrases with 'mise en musique' or 'lyrique', as had occasionally been found before. More works were called *drames lyriques*, and the rise in the number of operas based on recent historical events resulted in a huge increase in the designation *fait historique* (particularly in 1793–4). More frequently, authors opted for the comparatively neutral 'opéra' for their works in a serious tone. Frankly comic operas, especially those influenced by *opera buffa* models, were termed *opéras bouffons*, as custom dictated.

Only with the Empire and the Restoration, in the early decades of the 19th century, does 'opéra comique' appear in its modern sense – French operas with spoken dialogue – with any frequency, and even then authors were loath to apply it to their works where comic elements were less important than dramatic or melodramatic ones (for example, Méhul's *Joseph* is called an *opéra* or *drame mêlé de chants*). Castil-Blaze (1821), among others, agreed with librettists and composers and argued that the repertory of the Opéra-Comique was too varied to fall into a single category and that the term was entirely misapplied to many items performed there. Authors' continuing commitment to accurate labelling remained a feature into the 20th century, and often newly invented terms or unusual ones appear: 'roman musical', 'complainte', 'fantaisie lyrique', to cite but a few. Monsigny's *Le déserteur* (1769), Cherubini's *Médée* (1797), Gounod's *Faust* (1859), Bizet's *Carmen* (1875), Massenet's *Manon* (1884), Milhaud's *Le pauvre matelot* (1927) and many others were not called 'opéras comiques' by their librettists and composers; indeed, the use (or misuse) of the term to cover all French operas with spoken dialogue, at least those given at the Opéra-Comique, seems to date from the late 19th century (it so appears in the writings of Pougin, Félix Clément and Larousse, and the first edition of Grove's *Dictionary*).

Finally, the French 'comédie' and 'comique', when used by librettists, composers and their contemporaries, have no precise equivalents in other languages: European traditions differ, at times substantially. J.F. Marmontel (*Encyclopédie*) defined *comédie* as 'staged mores' designed to portray the human condition and human frailties while entertaining (sentiments in part echoed in Balzac's phrase 'la comédie humaine'). Marmontel divided *comédie* into three distinct categories – 'bas', 'bourgeois' and 'noble' (or 'haut') – based not just on the rank and social position of the leading characters, but also on the tone (from the farcical to the tear-jerker) and type of humour (or absence thereof). Even so, he oversimplified the then current situation, as his own qualifications (for example, his exclusion of satire and the 'comique grossier' of the *comédie-parade*) indicate, and a survey of theatrical productions including works using music would support. French playwrights drew on a rich heritage that included the works of Rabelais, the satirical and licentious 16th-century poet, Marivaux, the witty early 18th-century playwright noted for sparkling bourgeois dialogues, and Molière, whom Marmontel and others took as the model for *comédie*. It is impossible to define Gallic humour in a few words; Marmontel mentioned 'malice naturelle', certainly a component, but repartee, word-play and other elements contribute as well.

Rather than the blind labelling of all French lyric works with spoken dialogue as 'opéras-comiques', a more fruitful approach to individual works is to heed the terminology of the authors and their contemporaries and, with that as a guide, to place them in appropriate theatrical, musical, literary and aesthetic traditions. In any case, 'opéra comique', as currently used, is not so much a genre (with many sub-genres) as an indication of procedure: the mixing of spoken and sung elements.

2. 18TH-CENTURY ANTECEDENTS AND MODELS. Mid-18th-century *opéra comique* drew on a rich theatrical heritage. The Théâtres de la Foire of St Germain and St Laurent (the Opéra-Comique) offered passers-by numerous vaudevilles in which earthy humour and social and sometimes political critique were often intermingled, and the official, prestigious theatres (the Opéra and the Comédie-Française) were not spared biting satirical treatment in parodies. The mixture of well-known *airs*, the audience's interpretation of the couplets (in part informed by the recollection of the original words and an appreciation of the irony resulting from a comparison with the new) and, in the spoken dialogue, witty repartee among the actors (in which improvisation had a significant role) all contributed to the popularity of the genre. Many of the early librettists of *opéra comique* had extensive experience in the vaudeville (Favart is an excellent example), and the tradition continued well into the 19th century (in the works of Eugène Scribe and his contemporaries). Occasionally an *opéra comique en vaudevilles* was reset as a *comédie mêlée d'ariettes* (e.g. J.-P.-E. Martini's *Annette et Lubin* of 1789, based on Favart's 1762 work). A.-F. Quétant (1765) and others felt that the *vaudeville* was the major source of the *opéra comique*. The Théâtres de la Foire and the Comédie-Italienne provided other models in their *comédies-parades* with stock characters drawn from the *commedia dell'arte* tradition, but now with a distinctive Gallic accent and with slapstick remaining an important ingredient.

Other successful theatrical entertainments, too, showed the way for later 18th-century authors. Divertissements were a frequent and popular feature of the Comédie-Italienne play repertory, though little of the music survives (except in Mouret's work). Dance forms and rhythms permeated many vaudevilles and *ariettes*. Molière's *comédies-ballets* often lampooned middle-class stereotypes in a way that had a lasting appeal; they not only combined vocal music, dance and dialogue effectively but also proved that verbal finesse and comedy could co-exist. In fact, to separate 'opera' and 'play' into neat categories does a disservice to French theatre of the 18th century. Marivaux, the most famous Comédie-Italienne playwright of the first half of the century, provided enduring bourgeois characters and situations in sparkling dialogue

exploited by librettists for more than 100 years. The tighter dramatic structure, the 'better' tone and other features distinguishing his works from the vaudevilles and *comédies-parades* influenced, among others, Favart, whom Voltaire credited with the creation of *opéras comiques* suitable for polite society (unlike the offerings of the Théâtres de la Foire). Finally, authors at the Opéra-Comique and the Comédie-Italienne (which absorbed its rival in 1762) were sensitive to the elements that contributed to favourable reactions to the repertory at the Académie Royale de Musique, particularly certain *opéras-ballets*. Though the staging and costumes could not compare with those at the *premier théâtre lyrique*, the taste for the fanciful and exotic, for an idealized *villageois* and for a display to please the eye as well as the ear was common to both.

No single genre provided the unique source for *opéra comique*. Authors drew from different parts of the French heritage in varying degrees and sometimes added to it elements from foreign theatrical traditions in plays (such as the English) and in operas (particularly the Italian *opera buffa*). But the result was truly French, and the best works had continuing popularity in Paris and a wider, European appeal.

3. FROM THE QUERELLE DES BOUFFONS TO THE END OF THE 'ANCIEN RÉGIME'. *Opera buffa* and intermezzos had made occasional appearances in France before the mid-18th century without arousing much interest or controversy. But in 1752–4 a visiting Italian troupe's performances of Pergolesi's *La serva padrona* and other works at the Académie Royale de Musique initiated the Querelle des Bouffons, during which the merits of Italian (comic) opera and French (serious) opera were hotly debated. An ardent italophile, J.-J. Rousseau nevertheless produced a charming *intermède*, *Le devin du village* (1752), French in spirit though using some *buffo* forms. In it he sought to capture village innocence in naive melodies: his strengths lie in a sensitivity to declamation, and even his lack of interest in complex harmonies and orchestral textures becomes an asset for the unsophisticated tale. Sung throughout and in the repertory of the Académie Royale, this work as well as the *opere buffe* served as a model for *comédies mêlées d'ariettes*.

The entrepreneurs of the Théâtres de la Foire and the *sociétaires* of the Comédie-Italienne soon capitalized on the public curiosity and fondness for these works. During the 1750s *opere buffe* in French translation and sometimes with additional pieces appeared, and other works with new plots and dialogue parodied Italian models for the music. *La servante maîtresse*, Baurans' translation of Pergolesi's masterpiece at the Comédie-Italienne (1754), proved a favourite. Sedaine's *Le diable à quatre* at the Opéra-Comique (1756) drew on pieces by several composers, including Galuppi and Duni. Newly composed scores in similar vein soon appeared. Dauvergne's *Les troqueurs* (libretto by J.-J. Vadé, Opéra-Comique, 1753), at first falsely announced as an Italian-based work for publicity purposes, is the earliest example.

By the 1760s *comédies mêlées d'ariettes* were more than mere *opere buffe* in French. Lively spoken dialogue and constructions of scenes and acts in accordance with *comédie* principles reflected the native heritage. Audiences required excellence in acting as well as in singing. From the vaudeville and the divertissement composers inherited strophic and other simple forms for their *airs* and a vocal style often close to popular songs. Librettists (who were often also playwrights) ensured that the texts presented a variety of theatrical entertainment and kept up with the latest trends. But *opera buffa* did provide important models for more florid *airs* (generally assigned to the heroine), for conversational duets and for an occasional extended ensemble.

Three composers merit special mention. Duni, an Italian who arrived in Paris in 1757, immediately achieved a stunning success with *Le peintre amoureux de son modèle* (Opéra-Comique, libretto by Anseaume), in which he showed his assimilation of French features within a light and lyrical style. Other influential works at the Comédie-Italienne soon followed, such as the *villageois Les deux chasseurs et la laitière* (Anseaume, 1763) and the *féerie La fée Urgèle* (Favart, 1765). Philidor, from a long line of French musicians, also had English experience, and in *Tom Jones* (Poinsinet, 1765), based on Fielding's novel, he sought to exploit a growing anglophile trend. In it he handled duets and ensembles with dramatic and musical flair. In collaboration with Sedaine, Monsigny contributed to the variety of types – from the lighthearted *On ne s'avise jamais de tout* (Opéra-Comique, 1761) to another English-based work, *Le roi et le fermier* (Opéra-Comique, 1762), in which a benevolent monarch appears as a central character, and the *drame lyrique Le déserteur* (Comédie-Italienne, 1769), in which comedy and pathos are adroitly juxtaposed in the libretto and supported by an appropriate musical translation.

The works of Grétry at the Comédie-Italienne best represent the achievements in *comédie mêlée d'ariettes* and other operatic types of the *ancien régime*. He combined a gift for lyricism matching the declamation of the words with a fine dramatic sense and an ability to depict individual characterization musically. He experimented with matching musical forms to scenic requirements, and particularly in his later works sought more extended structures. Marmontel's librettos often reflect a moralizing sentimental tone and exploit currently fashionable themes: for example, the noble savage (*Le Huron*, 1768), intrinsic merit as more important than birth (*Lucile*, 1769) and conjugal love in adversity (*Silvain*, 1770). The most popular of his collaborations was *Zémire et Azor* (1771), an ambitious *opéra féerie* in four acts. Grétry responded with scores dominated by touching *airs*, but ones in which duets and ensembles played an increasingly important role in defining characters and translating their emotional states (in *Zémire* the trio of the heroine's grieving family shown to her in a magic picture is an excellent example of Grétry's artistry; fig.1). He also continued to set more frankly comic works reminiscent of the repertory of the Théâtres de la Foire: the *comédie-parade Le tableau parlant* (Anseaume, 1769), with its witty dialogue and light *airs*, proved an enduring opera.

With the mid-1770s and 1780s came some works in a consistently serious tone, although comedies remained the core of the Comédie-Italienne's repertory. The librettist B.F. de Rosoi led the way with his patriotic *Henri IV* (set by J.-P.-G. Martini, who used a military and heroic musical style to good effect, 1774) and his classical *drame Les mariages samnites* (set by Grétry, 1776); significantly, neither was a popular success. A much better man of the theatre, Sedaine provided Grétry with a series of challenges

1. Scene from Act 3 of Grétry's 'Zémire et Azor': engraving by Pierre-Charles Ingouf after a gouache by François-Robert Ingouf, c1771; the heroine's grieving family are is to her in a magic 'picture'

in 'chevaleresque', pseudo-historical and *drame* or *drame*-influenced works, including *Aucassin et Nicolette* (1779), their masterpiece *Richard Coeur-de-lion* (1784), *Le comte d'Albert* (1786) and *Raoul Barbe-bleue* (1789). Grétry responded with scores in which some attention was given to aspects of 'local colour' or music's contribution to definition of a specific setting (such as Blondel's 'Une fièvre brûlante', in which Grétry re-created, though did not precisely imitate, a medieval tune and used it symbolically in recurring fashion at strategic moments in *Richard Coeur-de-Lion*). *Barbe-bleue* especially is remarkable for its time for the freedom and continuity of musical forms to underline the dramatic situations. A newcomer, Dalayrac, also made notable additions to the repertory in *Nina* (1786), on a *larmoyant* subject, and in the 'chevaleresque' *Sargines* (1788). Both composers made effective use of expansion of resources at the theatre in terms of personnel (a greater number of soloists, a newly formed chorus and a slightly larger orchestra) and of staging (with an increase in spectacle, particularly in 'chevaleresque' works). While *air*-dominated operas, true *comédies mêlées d'ariettes*, remained very popular, these works pointed the way to the next decade.

By the eve of the Revolution, operas with spoken dialogue on a wide range of subjects and in a variety of styles were the most important part of the Comédie-Italienne's repertory, so much so that Italian plays were dropped in 1780 and the proportion of new vaudevilles and French plays declined. The troupe enjoyed increasing aristocratic and royal patronage (particularly that of Queen Marie-Antoinette) during the final two decades of the *ancien régime*. The move to a new theatre building in a better quarter (1783) was one sign that it had become accepted by polite and fashionable society: its Fair origins were scarcely mentioned. Furthermore, the export of the operatic successes to the provinces (Lyons and Bordeaux, for example) and to other European centres (Vienna and St Petersburg among them) is a measure of their extraordinary popularity.

4. From the Revolution to the Restoration (1789–1830). To be sure, genuinely comic or lighthearted 'villageois' works did not disappear altogether from the stage during the 1790s. Popular items from the *ancien régime* repertory (such as Grétry's *Le tableau parlant* and Monsigny's *Rose et Colas*) were still performed in Paris and elsewhere. New works relying on tested formulae, such as J.-P. Solié's *Le secret* (libretto by F.-B. Hoffman, 1796), with its plot turning on mistaken identities and unfounded jealousy, were successfully given. But more often comedy was combined with and subordinated to dramatic twists and melodramatic elements, as in Le Sueur's *La caverne* (libretto by Dercy, 1793).

Still, 1789 and the early years of the Revolution brought major changes to the Comédie-Italienne (from 1793, the year French plays were dropped, called the Opéra-Comique). First, its monopoly on operas with spoken dialogue was challenged and soon disappeared, the Théâtre de Monsieur (from 1791 the Théâtre Feydeau) becoming a powerful rival. Other theatres sprang up and many put on vaudevilles and shorter operas. The Opéra-Comique had to compete for audiences and for authors – the more so since court patronage, of course, disappeared and some of the other rich patrons suffered (although both it and the Feydeau remained out of the reach of all but the better-off). The 1790s saw a huge increase in the number of lyric works; few achieved lasting success. In 1801 the Feydeau and Opéra-Comique, both beset by financial troubles, merged, and in 1807 Napoleon again extended a measure of official protection by regulating the repertories of other theatres and suppressing several.

The Revolution brought changes to the repertory. 'Royalist' works (such as Grétry's *Richard Coeur-de-lion*) disappeared after 1792 and the declaration of the Republic, and 'aristocratic' ones (such as Dalayrac's *Raoul, sire de Créqui*, 1789) were subject to revision or suppression. Topical references to recent events or political and social questions were frequent. Indeed, *faits historiques*, hurriedly written and staged, were little more than dramatic re-enactments fleshed out with appropriate additional details created by the authors; the rhetoric often mirrors that of government leaders and influential journalists. While most of these ephemeral works were by minor librettists and composers, occasionally recognized authors contributed, as did Grétry in *Callias* (libretto by Hoffman, Opéra-Comique, 1794) and Méhul in *Le pont de Lody* (libretto by E.-J.-B. Delrieu, Feydeau, 1797).

More significant musically and theatrically are substantial works without such obvious propagandist intentions (though less direct reflections of current ideals are not infrequent). In several exceptional compositions, so far have the composers moved from the models of their predecessors one may detect in them a new spirit and even the development of style and procedures important for Romanticism (as Dean, 1967–8, and Dent, 1976, have done). In this group, best represented in the works of Méhul, Le Sueur and Cherubini, the *comédie mêlée d'ariettes* virtually disappeared in fact as well as in terminology. *Drame lyrique*, *comédie lyrique* and *opéra* became the most frequent designations: they were not

2. Act 1 scene vii (Dickson receives a letter from the White Lady) of Boieldieu's 'La dame Blanche', Opéra-Comique (Salle Feydeau), Paris, 10 December 1825, with (left to right) Jenny (sung by Mme Boulanger), Dickson (M. Fériol) and George Brown (Louis Ponchard)

merely semantic choices, but proof of their authors' intentions to point to aesthetic principles of French dramaturgy and the importance of models from serious *opéra* (though the heritage of the Comédie-Italienne persisted in the *romances* and the increasingly few comic pieces). Hitherto forbidden subjects on these stages were tackled, from classical tragedy (Cherubini's *Médée*, 1797) to incest (Méhul's *Mélidore et Phrosine*, 1794), and the general tone was heroic, at times violent.

Individual numbers, even most of the *airs*, are more substantial and have greater musical weight than those of the previous generation. Méhul's *Stratonice* (libretto by Hoffman, Comédie-Italienne, 1792), with only six pieces in one act, takes longer to perform than his predecessors' scores with double that number. Principles of symphonic development were exploited in often complex textures, as in the quartet from the same opera. Here and elsewhere, the orchestra is more than mere accompaniment to tuneful vocal lines: it becomes the main means of cohesion and of articulation of form. Distinctive timbres and orchestral effects are used for expressive purposes. Much of the dramatic action takes place in huge ensembles, as in Cherubini's *Lodoïska* (Fillette-Loraux, Feydeau, 1791), Le Sueur's *La caverne* and Méhul's *Ariodant* (Hoffman, Opéra-Comique, 1799). More extended harmonic vocabularies and sometimes remote modulations, too, set the works of all three apart from 1780 norms. Musical contrast (as in Grétry) becomes at times striking musical confrontation: contemporaries considered Méhul's jealousy duet from *Euphrosine* (Hoffman, Comédie-Italienne, 1790) particularly impressive. The chorus, often representing a picturesque group (brigands, Savoyards, monks, sailors) or even two opposing groups in conflict, take on major roles. Romantic aspects in the libretto prompted often descriptive musical responses: a violent storm in Le Sueur's *Paul et Virginie* (Dubreuil, Feydeau, 1794) and an avalanche in Cherubini's *Elisa* (Saint-Cyr, Feydeau, 1794). Against a more symphonic orchestral part, composers could write emotionally heightened parts for the voice where beauty of melody took second place to theatrical truth: the Countess in Méhul's *Euphrosine*, Calypso in Le Sueur's *Télémaque* (Dercy, Feydeau, 1796) and the title character in Cherubini's *Médée* are examples. All three composers experimented with making opera with spoken dialogue a more continuous and integrated form. Among the techniques found in varying degrees were the reduction of spoken dialogue, effective employment of *mélodrame*, linking of pieces, overall tonal structures to scenes, acts and sometimes entire operas, and sophisticated orchestral use of reminiscence motifs as much more than melodic tags. Cherubini's *Médée* and Le Sueur's *Télémaque*, both on librettos intended for the Opéra, reflect concern for unity, but probably the most remarkable work from this point of view is Méhul's *Mélidore et Phrosine* (A.-V. Arnault, Opéra-Comique, 1794), particularly for its third act.

Beginning with the Thermidorian reaction and more pronounced during the Consulate and Empire, audiences favoured lighter, less moralizing and dramatic fare. *Comédies-parades* again became popular (for example Méhul's *L'irato*, B.-J. Marsollier des Vivetières, Opéra-Comique, 1801). The Maltese composer Isouard excelled in ensemble writing in *buffo* tone and style (*Les rendez-vous bourgeois*, Hoffman, Opéra-Comique, 1807, and other works). Successes among the *drame*-influenced works again included comic figures and situations with greater frequency, as in Cherubini's *Les deux journées* (J.-N. Bouilly, Feydeau, 1800). Entirely serious works, such as Méhul's biblical opera *Joseph* (A. Duval, Opéra-Comique, 1807), were more admired than popular in Paris. Boieldieu's *La dame blanche* (Scribe, after Scott, Opéra-Comique, 1825; fig.2), whose plot combined in a mildly Romantic brew a long lost hero, a haunted castle and buried treasure, had a tuneful score with touches of 'local colour' (such as the citation of 'Robin Adair' in the last act) and proved a long-lasting crowd pleaser. The achievements of Revolutionary opera (in orchestration and structure) were not forgotten entirely (Méhul continued to experiment with the sombre middle range of the orchestra, going so far as to replace the violins with violas

for his Ossianic *Uthal*; J.M.B.B. de Saint-Victor, Opéra-Comique, 1806), but the spirit in the majority of works – and nearly all those that stayed in the repertory – ranged from sentimental to comic: in short, more in keeping with the aesthetics of the generation of Grétry (many of whose works were revived at this time), though without a return to forms of that period.

5. 1830–70. Between the July Revolution and the Franco-Prussian war, the Opéra-Comique offered Parisians numerous new works in accordance with its policies of promoting the French language and French composers and artists, generally eschewing the low humour of the boulevard theatres and the often farcical or satirical situations of the *opéra bouffe*. *Opéra comique* authors provided romantic tales allowing for the exploitation of 'local colour' and with happy endings as well as 'chevaleresque' works and comedies relying on traditional formulae. Rossini's influence was strong, demanding Italian vocal virtuosity, but these *grands airs* contrasted with sentimental romances and comic strophic songs, the French heritage. Auber (in collaboration with Scribe) was one of the most prolific and popular: *Fra Diavolo* (1830) and *Le domino noir* (1837) remained repertory items into the 20th century. The contributions of Hérold and Adam held the stage in Paris for over 50 years.

Foreigners also tried their hand at *opéra comique*: the most successful example was Donizetti's *La fille du régiment* (1840), which remains close to *opera buffa* in style. Meyerbeer's works for the Opéra-Comique are richer orchestrally and scenically than the norm: his *L'étoile du nord* (1854) demonstrates most clearly the influence of *grand opéra*.

Specifically French in flavour and almost an *opéra bouffe*, Massé's *Les noces de Jeannette* (1853) proved with its over 1500 performances in Paris alone the continuing vitality of well-known plot formulae. Better known for his operas and ballets for the Opéra, Halévy also wrote for the Opéra-Comique: *Les mousquetaires de la reine* (1846) is a fine example of the 'chevaleresque' and sentimental. Increasing interest in the exotic is perhaps best exemplified in David's *Lalla-Roukh* (1862), set in Kashmir. Finally, towards the end of this period there was a shift to a predominantly serious tone. In Thomas' *Mignon* (1866), after Goethe, melodic grace and gentle, chromatic harmonies match the melancholy of the libretto.

The Opéra-Comique was not the only Parisian theatre to put on opera with spoken dialogue. Though generally presenting a more conservative and traditional repertory (including revivals of Grétry and Méhul) and introducing the public to foreign works in translation and adaptation (including operas by Verdi), the Opéra-National also provided opportunities for French operatic newcomers, such as David and Bizet (*Les pêcheurs de perles*, 1863). Furthermore, composers were allowed to experiment in more intense, almost psychological dramas, avoiding the grandiose favoured at the Opéra and the sometimes facile humour and resolutions of the plot preferred at the Opéra-Comique. The best example is surely the original version of Gounod's *Faust* (1859), still among the most admired of 19th-century French works in the repertory.

In short, there was at the Opéra-Comique and the Théâtre Lyrique a wide range of subjects, an eclecticism in musical styles and forms and a willingness to adapt from other genres. Tradition dictated that acting and stage presence remained important. The costume and set designs and mise en scène now often more elaborate than in previous generations and newly prepared for each work, were exported along with the scores.

In 1856 Offenbach published an extensive guide to the traditions of *opéra comique*, sending a copy to potential entrants to a competition for a one-act operetta. He saw it as a particularly French creation, distinguishable from the Italian *opera buffa*, on which it had originally been modelled, by its love of wit and mischief. He lamented the hybrid forms, leaning more towards the traditions of *grand opéra*, which had seduced several composers away from the pure traditions of *opéra comique* and which he regarded as a stream that had turned into a river and subsequently burst its banks.

Certain features can be considered to distinguish *opéra comique* traditions from those of *grand opéra*, apart from its convention of spoken dialogue rather than recitative. First, there was a tendency for grand spectacle at the Opéra, only rarely matched by the Opéra-Comique. A tendency, around 1860, for the theatre to become 'a branch of the Opéra' did not pass unnoticed among the critics. Secondly, while ballet was *de rigueur* at the Opéra, it was not at the Opéra-Comique which preferred crowd scenes involving choral writing.

While large-scale works at the Opéra generally had two prominent and vocally demanding female roles, the Opéra-Comique tended to require a leading soprano role with a flexible and agile voice (*sopran à roulades*) and a supporting soprano, light rather than virtuoso or dramatic in character, for whom many a composer wrote *couplets* or *romances* that were a hallmark of *opéra comique*. There was a similar preference for a lighter voice in the male roles, the *ténor léger* and the *basse chantante*. It was not until 1871 that a *fort-ténor* was employed at the Opéra-Comique.

These four decades saw the premières of some of the most popular operas ever produced, and they remained in virtually continuous repertory in Paris and throughout the world wherever French opera was staged until World War II. Many had more than 1000 performances at the Opéra-Comique alone and were the staples of regional theatres in Germany and Austria as well as francophone countries.

6. 1870–1918. The Théâtre Lyrique did not long survive the Franco-Prussian War. The Opéra-Comique took over part of its repertory and, to a greater extent than before, included recent foreign works (by Mascagni and Puccini, for example). The most memorable of the new operas by Frenchmen departed from the conventional mould for this theatre. In all of them comedy is minimal or entirely absent, and there were several works that included no spoken diologue. Of these Gounod's *Roméo et Juliette* was the first, followed by Massenet' *Werther* and *La Navarraise* and Bizet' *Les pêcheurs de perles* as well as operas by Bruneau. Works performed at the Opéra-Comique were less and less frequently characterized by their composers as *opéras comiques*, and there was a return to the practice of naming each work appropriately. Thus titles such as *comédie lyrique*, *roman musical* and *conte lyrique* were used, and once and for all the link between genre and theatre was broken.

Among the most enterprising in finding ways of combining spoken dialogue with sung sections was Bizet's *Carmen* (1875). Here melodrama, pantomime, recitative and aria were combined with spoken sections with offstage

military and bull-fight music. Its Spanish setting, incorporating hispanic modes, dance forms and popular song, was a model for subsequent composers. Offenbach in *Les contes d'Hoffmann* (1881) produced an episodic fantasy while Massenet's *Manon* (1884) presented another strong heroine. In *Louise*, a *roman musical* (1900), Charpentier sought social realism in a working-class setting. Debussy's *Pelléas et Mélisande* (1902) finally demonstrated that the Opéra-Comique could rival the Opéra in terms of seriousness. Debussy wrote a subtle work in which the natural quality of conversation contributes to its lightness of touch. Its fairy tale setting and unspecific historical place accorded with the essential definition of *opéra comique* as a play turned into opera.

7. Epilogue. After World War I the Opéra-Comique remained committed to producing new works for its audience, but the genre of *opéra comique* took on a new lease of life with the neo-classicists and Les Six. Although none of Milhaud's works is named as an *opéra comique* several have a *buffo* element and *Esther de Carpentras* is categorized as an *opéra bouffe*. These trends were continued by Jacques Ibert, whose tight style matched that of Milhaud and whose *Le roi d'Yvetot* he called an *opéra comique*.

Situation comedies and operas with a 'kitchen-sink' setting, as well as parodies of classical myths and *commedia dell'arte* subjects, also became prime material for *opéra comique* or *opéra bouffe*. Into these categories fall Roussel's *Le testament de la tante Caroline* (1963), Barraud's *Lavinia* (1969) and André Bloch's *Guignol* (1949), along with many of the operas for which Nino wrote the librettos.

3. Poster by Prudent Louis Leray for Bizet's 'Carmen' (showing the final scene in Act 4), printed for Choudens at the time of the original production at the Opéra-Comique (Salle Favart), Paris, 1875

The Opéra-Comique also mounted premières of operas written for other theatres, such as Stravinsky's *The Rake's Progress* (1951; 1953) and Britten's *The Rape of Lucretia* (1946; 1971) and a few world premières of works by French composers. Among the most significant were Milhaud's *Le pauvre matelot* (1927) and two works by Poulenc: *Les mamelles de Tirésias* (1947), an *opéra bouffe* whose mordant wit caused an uproar at its première and *La voix humaine* (1959), a *tragédie lyrique* for solo soprano.

But the Opéra-Comique was no longer the leader: theatres in Monte Carlo, Brussels and Geneva rivalled or surpassed it in the performance of new works (as sometimes benefited Honegger, among others). Dramatic composers preferred to write operas sung throughout or to explore new areas, such as film music or works for radio. Furthermore, the Opéra-Comique's audience dwindled for the recent operas, whatever their critical reception, to the extent that none of the post-World War I works entered the standard repertory as had those by earlier composers from Grétry to Massenet; only war-horses, such as *Mignon*, *Carmen* and *Manon*, could draw the public consistently. The dissolving of the resident troupe in 1972 marked the end of a distinguished tradition, which for over two centuries had given Paris and other cities some of the most endearing and enduring examples of music theatre.

M. ELIZABETH C. BARTLET (5–7, with RICHARD LANGHAM SMITH)

Opéra féerie (Fr.). A type of French opera or *opéra-ballet* that has a plot drawn from fairy tales and/or makes extensive use of elements of magic and the *merveilleux*. In his *ballet-héroïque Les fêtes de Polymnie* (1745), Rameau ranked the 'féerie' with history and fable as a resource for the lyric stage. A huge corpus of *opéras* (such as Monsigny's *La belle Arsène*, 1773), *opéras-ballets* (such as *Zélindor, roi des sylphes* by François Francoeur and François Rebel, 1745) and *opéras comiques* (such as Duni's *La fée Urgèle*, 1765, and Grétry's *Zémire et Azor*, 1771) of the late Baroque and Classical periods in France attests its popularity. While the term *opéra féerie* was uncommon in the 18th century (although it did exist, e.g. Dezède's *Alcindor*, 1787), and entered the current vocabulary only after 1800, modern scholars use it with justice to refer to these earlier works. Some early 19th-century examples employ the term (e.g. Isouard's *Cendrillon*, 1810, Catel's *Zirphile et Fleur de Myrte*, 1818, and Carafa's *La belle au bois dormant*, 1825). After this period the *féerie* survived in ballet. (For the German 19th-century fairy tale opera, *see* MÄRCHENOPER.)

M. ELIZABETH C. BARTLET

Opéra National du Rhin. French opera and dance company founded in 1972, based in Colmar, Mulhouse and STRASBOURG.

Opera North. English opera company founded in 1977, based in LEEDS.

Opera of the Nobility. The name sometimes given to the London opera company active, in rivalry to Handel's company, from 1733 to 1737, initially at Lincoln's Inn Fields Theatre, later at the King's Theatre. *See* LONDON, §V, 1.

Opera Restor'd. Touring opera company formed in 1979 as the Holme Pierrepont Opera Trust, originally based at Holme Pierrepont Hall near NOTTINGHAM.

Opera Română (Rom.: Romanian Opera). Opera company founded in BUCHAREST in 1877.

Opéra Royal de Wallonie. Opera company based at the Théâtre Royal de Liège since 1967. *See* LIÈGE.

Opera semiseria (It.: 'half-serious opera'). An intermediate genre first identified during the early 19th century. The term was originally applied mainly to Italian equivalents of the French post-revolutionary 'pièce de sauvetage' such as Paer's *Camilla* (1799) or Simon Mayr's *Le due giornate* (1801), sometimes labelled 'drammi eroicocomici'. Later it was extended to comedies, akin to the French *comédie larmoyante*, that contain a strong element of pathos. The range of characters is generally wider than in *opera buffa*, but the same types prevail, the *basso buffo* being often more dangerous than his purely comic counterpart (as in Rossini's *La gazza ladra*, 1817). During the Romantic period *opera semiseria* usually has a pastoral setting, its heroine being a village maiden whose innocence, at first called into question, is finally vindicated amid general rejoicing. Examples include Donizetti's *Linda di Chamounix* (1842) and *Il furioso all'isola di San Domingo* (1833). Bellini's *La sonnambula* (1831) has all the attributes of the genre except the *basso buffo*; hence its description as a 'melodramma' *tout court*. *Opera semiseria* shares with *opera buffa* the tradition of 'recitative

secco'. A late example is Mercadante's *Violetta* (1853). Thereafter the term lapses, but it is noteworthy that in 19th-century Italian revivals Mozart's *Don Giovanni* (1787) was frequently described as an *opera semiseria*.

JULIAN BUDDEN

Opera seria (It: 'serious opera'). A term used to signify Italian opera of the 18th and 19th centuries on a heroic or tragic subject. The term was rarely used at the time; it can sometimes be found on manuscript scores, particularly in the last quarter of the 18th century, but 'dramma per musica' is the usual genre description on most 18th-century and many early 19th-century printed librettos. 'Opera seria' appears occasionally on librettos late in the 18th century, for example for Prati's *Armida abbandonata* (1785, Munich). Only as serious opera of this period came to be viewed historically was the term 'opera seria' applied exclusively to it.

1. DRAMATURGY. The characteristics of *opera seria* took shape during the first two decades of the 18th century as part of a literary reform led by the Arcadian Academy of Rome established in 1690. Responding to French criticism of Italian poetry and drama, the reformers looked with particular disfavour on the undisciplined, irrational and often licentious opera librettos then in use. They took steps to bring the libretto into accordance with the principles of classical Greek drama as set forth in Aristotle's *Poetics* and as exemplified in the 17th-century French neo-classical dramatists, JEAN RACINE and PIERRE CORNEILLE.

By the end of the first decade of the 18th century a number of practices had been established as desirable. The action should be limited to a single, central argument involving no more than eight characters, whose entrances and exits were strictly regulated so that the stage was never empty except during set changes and between acts. The action should take place within a short period of time, preferably 24 hours, and in locations of close proximity.

The rules of verisimilitude and good taste rejected tragic endings as unworthy of the civilized state now enjoyed. Poets were expected to portray what, according to an orderly moral system, should have happened rather than what actually did happen. Death, if unavoidable, should be handled with dignity, and preferably off stage. Suicides and deaths in battle could be tolerated but murder could not. Subject matter from ancient history was preferred to fables or myths. Spectacle should be confined to natural phenomena and human activity. Resolutions should occur through natural means, not through supernatural intervention (in contrast with French opera). Trips to the underworld were banished, along with all but an occasional ceremonial chorus. Ballet and the coarse, unseemly behaviour endemic to comic scenes were relegated to entr'actes (or intermezzos) unrelated to the serious drama.

Poets were admonished to strive for simplicity, naturalness, verisimilitude and dignity, and to instruct as well as to entertain. The end result should be of high enough literary quality to be enjoyed as literature. No attempt was made to alter the established theatrical format. The action moved forward in *versi sciolti* (freely alternating, unrhymed seven- and eleven-syllable lines) to be realized in spare, continuo-accompanied recitative, broken from time to time with moments of reflection, reaction or summation, in strophic verse, to be realized in da capo arias accompanied by strings, possibly with horns and oboes (occasionally flutes). The reform produced librettos with a greatly expanded number of *versi sciolti* and a decrease in the number of arias to no more than 30. Theatres, in turn, persistently reduced the amount of recitative to a minimum, indicating cuts in the *versi sciolti* by enclosing them in *virgole* or quotation marks in the printed libretto: the original text might thus be read in full, though only those lines essential to the understanding of the plot might survive in the setting. Operas in three acts persisted, unaffected by attempts to follow the French pattern of five. Ensembles were restricted to one per opera, usually a duet for the principal couple, and a closing tutti (*coro*) for all the characters at the end of Act 3.

By 1710 the 'exit aria' was firmly established as the norm: arias were always placed at the end of a scene, after which the singer would leave the stage. Occasionally a cavatina (a short aria without exit) would appear in a scene in which the same singer would later perform a full-length exit aria. In an *opera seria* libretto the scene as a block of text with a stable number of characters on stage was generally observed. As soon as someone arrived or left, a new scene began.

At the next level of organization in an *opera seria* libretto, a set of scenes is terminated either by a change of stage setting or by the end of an act. There is normally one set change in the middle of each act. The number of characters on stage tends to increase towards the centre of each set of scenes and then to decrease to the point where one character is left on stage to sing a monologue and aria. Only Act 3 ends with everyone on stage, to celebrate the happy conclusion. The second stage setting in each act tends to be a public scene with many extras and perhaps some spectacle – often a public ceremony or a military procession. By about 1750 the emphasis began to shift from the middle to the end of each act, which then becomes the province of the principals, whether in solo, duet or trio.

Librettists usually served as poets for a specific court or theatre, where they often remained for their entire careers; their duties included the revising of existing librettos and the writing of new ones to suit local requirements. Composers took similar permanent positions as *maestro di cappella* for a theatre or court; their duties included preparing revivals of their own operas and those of others as well as composing new operas, always designed to enhance the strengths and to conceal the weaknesses of the singers assembled for the season. They directed performances while providing continuo realizations from the harpsichord. Haydn's operatic activities at Eszterháza conformed to just such a position. Many composers depended on church-affiliated posts for their livelihood and contracted with individual theatres to compose one or more operas per year; such composers were expected to travel to each theatre in time to become acquainted with the singers and to write their arias and ensembles (recitatives might be written in advance; the opening

sinfonia was often the last component to be written). Whereas the same setting of an *opera buffa* might be performed at 20 different theatres, and *opera seria* setting was usually performed only one season; for subsequent productions, the libretto was usually heavily revised and would either be set afresh or would acquire new or borrowed arias, thus moving towards a PASTICCIO. Such borrowed arias were often the favourites of the singers, who carried them from theatre to theatre. In most theatres, pasticcios were used to round out the season, though in theatres of modest means, and in London, they predominated.

By the middle of the century the concentration of musical interest in the aria and the practice of tailoring roles to suit individual performers gave extraordinary power and control to singers. A complex set of rules maintained a strict hierarchy of rank, regulated the distribution of arias and determined their characteristics. At the pinnacle of the profession were the best of the castratos – an aberration inherited from the previous century and fostered in part to maintain the treble voice in both ecclesiastic and secular situations where women were prohibited. A castrato played the leading man (primo uomo or primo musico); he and the first woman (prima donna), male or female, usually formed the principal romantic couple. The number of arias per opera had been further reduced to about 20; the principal couple would have four or five each. Duets were virtually the exclusive province of this pair. The tenor, usually a patriarchal or ruling figure, might be either first or second ranking; he might join the principal couple in a trio. The second ranking couple had three or four arias each. Advisers and confidants would have no more than one or two each. Librettos were often revised to ensure that the least of this group sang the 'sorbet' aria (*aria di sorbetto*), at the beginning of Act 2, when sorbet was served and the clinking of spoons on glass is said to have obscured the singing. As the total number of arias decreased, the number assigned to individuals of each rank decreased proportionately. Ensembles might be counted as arias, as might sizable monologues. Each role required arias in a variety of affections or styles (*aria cantabile*, *aria d'affetto*, *aria di bravura*, *aria di mezzo carattere*). A character with a dominant musical personality would have at least one aria in contrasting style. Arias in the same style or key could not follow one another. The loose textual relationship between an aria and the preceding scene made it easy for a singer to substitute a favoured aria or aria text of the appropriate affection.

Meeting both the strict literary requirements and the unyielding theatrical conventions presented the librettist with a formidable task. Often little remains of a historical plot once the librettist has altered events to avoid offence while at the same time inventing enough political and amorous intrigue to create dramatic tension and provide excuses for 25 arias, properly distributed among six singers, and strategically placed to allow each character reasonable exits. Critics agreed that the two who came closest to realizing the ideal were Apostolo Zeno and Pietro Trapassi, known as Metastasio.

Zeno, greatest of the first generation Arcadian reform librettists, took little interest in how his librettos were translated into musical productions. An appointment to the Vienna court late in his career finally allowed him to write librettos without the love interest and intrigue required in Italy. Metastasio, on the other hand, inherited the reform libretto in its mature form. The remarkable success of his librettos resulted from a number of factors. First and foremost they embodied Enlightenment ideals, portraying characters able to overcome selfish human desires in order to achieve greatness in thought and deed in a world where monarch and subject alike must adhere to the highest moral principles. In their universality his messages remained apolitical and so posed no threat to the nobility who supported the theatre in most Italian centres. Secondly, Metastasio was greatly admired for his rational approach to the libretto, for the purity, elegance, clarity and dignity of his texts, and for the skill and artistry with which he was able to breathe realism and drama into the form he had inherited and went on to perfect. A third aspect of Metastasio's librettos was their supreme suitability for musical setting. Metastasio had begun his career under the tutelage of the venerable soprano Marianna Benti-Bugarelli, called 'La Romanina', and during his early career had worked closely with the young composer Vinci, whom 18th-century critics and historians consistently cited as among the originators of the modern or *galant* style in opera. The librettos Metastasio wrote for Vinci during the 1720s endured for 75 years, were set and reset by composers of several generations, and became the ideal against which all subsequent works were measured. The association ended with Vinci's death and the appointment of Metastasio to replace Zeno in Vienna, where he remained. Though Metastasio continued to experiment in his own librettos, by the middle of the century his *Artaserse* (1730) had become a rigid model that theatre poets followed in reworking librettos (Metastasio's as well as others') for local presentation (fig.1). Thus the genre and the dramaturgy it represents came to be called Metastasian.

The format of the reform libretto endured in no small part because it produced an evening of entertainment that served the social functions of the theatre. The opera house in 18th-century Italy was an important social meeting place. The fashionable part of the audience, who customarily owned boxes or rented them by the season, attended night after night. Since the season consisted of a few works, each given a continuous run of up to several dozen performances, the audience could scarcely have been expected to sustain a close interest in the stage action; and since the literate part of it knew Metastasio's dramas virtually by heart, they could dip in and out at will, interrupting the flow of social intercourse to attend to the most affecting scenes or the favourite arias of the leading singers. From this resulted the audience's noisiness and inattention, so often remarked upon by foreign visitors.

2. 1720–40. Although *opera seria* acquired its definitive literary and dramatic form only during the 1720s, many of its musical characteristics were present earlier. In Naples, Alessandro Scarlatti began to simplify his accompaniments, thus placing greater emphasis on the melodic line. In his *La Griselda* (1721), arias in the old style coexist with a newer type characterized by static bass lines and slower harmonic change.

Excluding Handel, whose operas, written for London, lie outside the Italian tradition and had little or no influence, the dominating figures of the first age were Vinci, Leo, Porpora, Hasse and Pergolesi, who followed Scarlatti in pursuing the new, more clearly articulated melodic style and its simple, harmonically generated

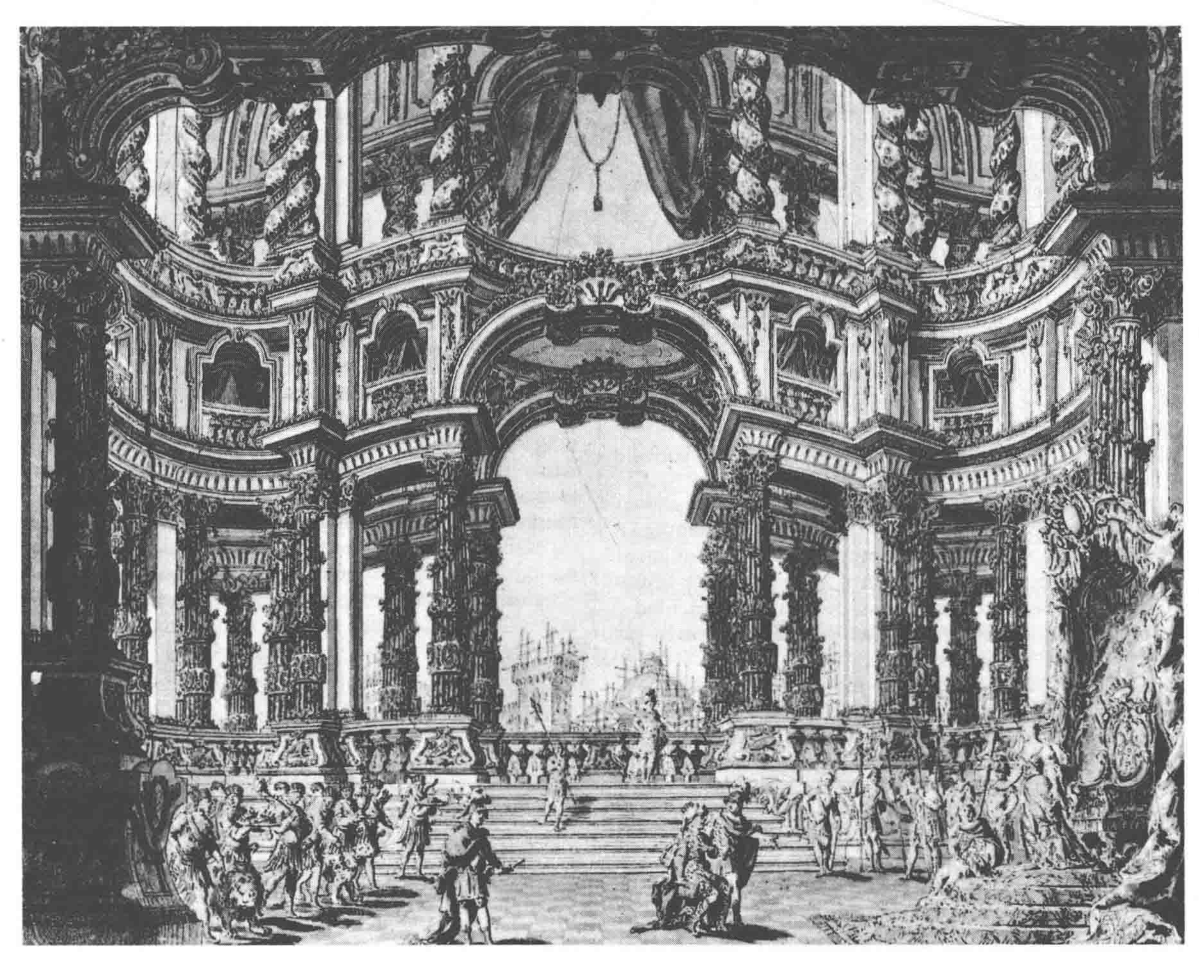
Perchè tarda è mai la morte,
Quando è termine al martir?
A chi vive in lieta sorte,
E' sollecito il morir.

1. Opening of 'Artaserse', Act 3 scene i, from Pietro Metastasio's 'Opere' (Venice: Zatta, 1781–3), with (left) an engraving of the final scene by G. Zuliani after Pietro Antonio Novelli

accompaniment. Their style was perceived as a departure; its success carried their music not only all over Italy but also throughout Europe. Vinci was credited with a major role in its formation, especially as regards periodic melody, with balanced (often three-bar) phrases. His settings of Metastasio for Naples, from *Didone abbandonata* for Carnival 1726 to *Artaserse*, completed shortly before his death in 1730, proved epoch-making. Through their collaboration the Arcadian reform libretto and the new *galant* or early Classical style became inextricably linked.



For composers, the primary problem in putting together an opera of 25 or more arias was that of contrast. Metastasio's fine control and subtle variety of moods helped solve it. Departures on the composer's part, such as the omission of a ritornello, as well as the singer's improvised decorations, accomplished still more. Instrumental colour remained fairly uniform and minimal. Metric variety was limited. Expressive harmonic nuance was used sparingly and restricted to Neapolitan 6ths, augmented 6ths, diminished 7ths, deceptive moves, modulation and modal contrast. Tonal planning consisted of selecting keys to suit the affections of the arias. The recitative that connected them moved towards the flat side or into the minor mode for tender emotions or 'negative' events and towards the sharp side for 'positive' events or aggressive actions. The keys used rarely went beyond three accidentals. As a result several arias were likely to share the more popular ones (such as D major for bravura, D minor for rage, E♭ for pathetic affects, G minor for lyrical yearning, G major for pastoral tone, A major for amorous sentiment, etc.). D major remained the overwhelming favourite for the opening sinfonia and the closing *coro*. Characters tended to acquire either a sharp- or flat-dominated personality and even occasionally a predominant tonal reference, but always with one aria in a contrasting tonality. In observing the rules dictating that affections must alternate between successive arias, composers often wrote arias alternately in sharp and flat keys; some composers also seem concerned with establishing close key relationships among arias within a set of scenes or at major articulations, such as the beginning and ending of an act or a group of scenes. Symbolic relationships of a tritone or a semitone may be found, and the composer may also set up moves in one direction or the other (towards the sharp or flat side) within groups of scenes or acts. Last-minute revisions, transpositions and substitutions may obscure such planning, which tends to disappear in later revivals, especially when additions and substitutions are made. In spite of whatever tonal planning the composer might have had in mind, the stark stylistic contrast between aria and recitative tends to produce the impression of a loose stringing together of individual numbers rather than an organic unity; efforts in achieving the latter were made only slowly and fitfully.

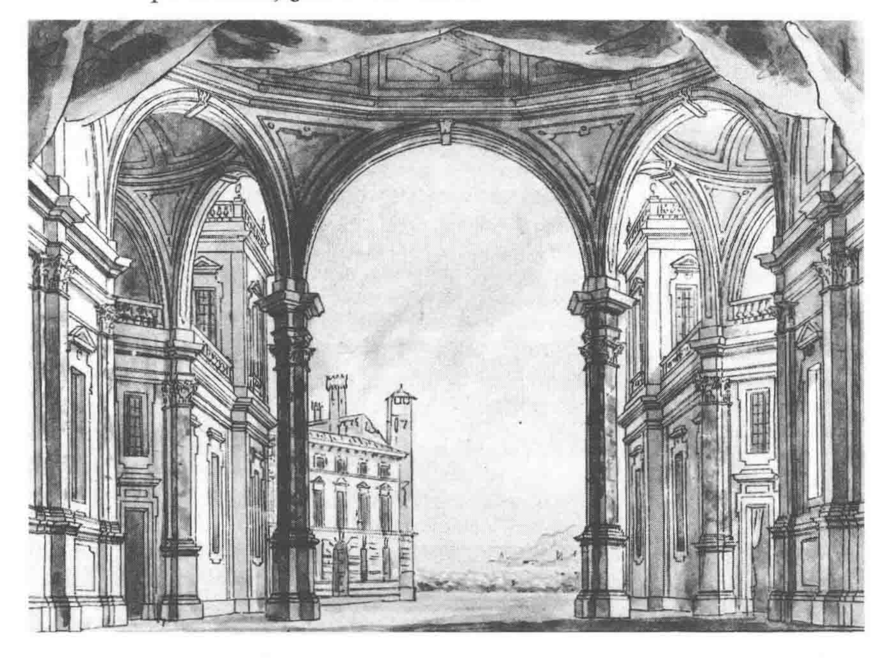
3. 1740–70. The second age of *opera seria* was dominated by Hasse, Jommelli, Galuppi, Traetta, G.F. de Majo, Perez, Terradellas and J.C. Bach, most of them Neapolitan or Neapolitan-orientated. The careers of Gluck and Graun ran parallel with it. Several important composers worked outside Italy, and this period was marked by the diffusion of *opera seria* and its associated styles throughout Europe. Hasse carried the perfected form to Germany in the 1730s and was long *maestro di cappella* at Dresden. In 1737 the great castrato Farinelli, Metastasio's adopted brother, entered the employment of the Spanish court in Madrid, where he directed Italian *opera seria* until his retirement in 1759. In 1749 Jommelli

and Galuppi, at turning-points in their careers, were called to Vienna; Majo and Traetta were later called to both Vienna and Mannheim. Perez moved to Lisbon in 1752 and Jommelli began his long reign at Stuttgart in 1754. During the 1760s in Mannheim, the Italian librettist Mattia Verazi provided innovatory librettos for a succession of guest composers. In France, at the middle of the century, an Italian *buffo* troupe inspired the QUERELLE DES BOUFFONS and paved the way for the eventual arrival in Paris of Gluck, Piccinni and others, who established an international style in the French *tragédie en musique* during the 1770s and 80s.

Metastasian librettos quickly gained popularity and dominated the Italian repertory during the 1750s. Thereafter the works of younger librettists, reworkings of earlier librettos, and a growing interest in comic opera gradually eroded this monopoly. Opera continued to consist of a succession of simple or continuo-accompanied recitatives and orchestrally accompanied arias. The action moved forward in *recitativo semplice* (simple recitative), composed in a spare, narrow-ranging, declamatory style with a basso continuo made up of a harpsichord, cello and violone providing one or two harmonies per bar. Usually no more than one or two select solo scenes or speeches leading to an aria or ensemble would be set in *recitativo obbligato*, where strings enhance the drama by providing expressive ritornellos and obbligato motivic commentary in vocal caesuras. To heighten the effect of solemn pronouncements, the strings might play sustained harmonies, a style known as *accompagnato* or accompanied recitative. Occasionally a composer provided recitative with a measured accompaniment in aria style. Jommelli, a commanding figure in *opera seria* at the middle of the century, was among the first to exploit the heightened dramatic intensity inherent in orchestral recitative. As early as the 1740s, before his foreign visits, he was transforming *opera seria* through the use of obbligato recitative and through the introduction of declamatory elements into the arias, the exploration of orchestral sonorities (including four-part textures) and the development of the crescendo and other dynamic contrasts.

Ensembles gradually became more frequent, often contributing to a decrease in the number of arias by replacing the last few scenes and arias of an act, where the characters were reflecting on the action, singing arias and leaving one at a time. The quartet in Act 1 of Galuppi's *Artaserse* for Vienna (1749) is an early example (Mozart may well have modelled his quartet in *Idomeneo* on it). In the 1760s only Jommelli in Stuttgart and Galuppi in Venice regularly concluded Act 1 and Act 2 with ensembles, a duet and a trio (occasionally a quartet). The predominantly French-inspired modifications in *opera seria* that Algarotti sought to promote were much more

2. Design by Galli-Bibiena (probably Giuseppe) for Act 1 of a production of 'Didone abbandonata', possibly in Hasse's setting, Berlin, 1753



likely to be realized, as he noted, in the great authoritarian capitals – the court-sponsored theatres of Berlin, Dresden, Vienna, Paris and St Petersburg – than in the mainly civic enterprises of the Italian towns or London.

Efforts to escape from the rigidity of the Arcadian reform libretto began in 1755, with Jommelli and Verazi's French-inspired *Enea nel Lazio* and *Pelope*, for Stuttgart. They blurred the lines between recitative and aria (with obbligato recitative and the infusion of the aria with declamatory elements and action), circumvented the exit-aria convention with cavatinas and reintroduced long-banished spectacular elements. These works, based on mythological subject matter involving deities, superimpose supernatural appearances, machine spectacle, chorus and pantomime on an italianate format. In 1759 Traetta, in Parma, became involved in quite another approach, that of setting Italian translations by C.I. Frugoni of two reworked French operas by Rameau, as *Ippolito ed Aricia* and *I tindaridi*. This much-heralded breakthrough produced similar results: Italian aria opera on mythological subject matter with choruses, programmatic orchestral music and spectacle. In 1762 Traetta was invited to Mannheim for a collaboration with Verazi on *Sofonisba*. Here can be found the earliest of Verazi's efforts to challenge Italian formal and dramaturgical conventions: the tragic ending (Sophonisba dies after drinking from a poisoned cup) is a flagrant departure from the laws of verisimilitude; pantomime ballet invades the programmatic overture as well as the opera itself; extensive obbligato recitative and declamatory elements in the arias blur the normally stark demarcations between the two. Finally, Verazi invented for Traetta a trio of diminishing forces which, like the ending of an *opera seria* act, closes with a single character on stage.

In Vienna, as early as 1760, Hasse's *festa teatrale Alcide al bivio* showed French influence. Traetta was invited to Vienna in 1761 to write a short, French-inspired serious piece, *Armida*, which closely follows Quinault's libretto for Lully (1686). An *azione teatrale* in 20 scenes, it carries the *divertissements* for chorus, dance and pantomime found in the original. Gluck's celebrated *Orfeo*, a similar piece, followed in 1762. Spectacular elements as well as the suspension of the exit aria convention are not uncommon in the *azione teatrale* and do not constitute the same deviation from conventional practice that they would if appearing in a full-length *opera seria*. In 1763 Traetta wrote the first such opera for Vienna, on a text by Coltellini, *Ifigenia in Tauride*. The libretto is based on classical subject matter and focusses on a single action, but the work still largely adheres to the formal and musical conventions of *opera seria*. Its principal departures take the form of several scene complexes (single scenes encompassing a multiplicity of set pieces, usually cavatinas, choruses and dance, without the disruption of an exit aria), a duet with chorus and a duet for Iphigenia and her confidante. The French-inspired scene complex stands at odds with Italian practice, which dictated that exits must follow all ensembles and most arias, and that choruses and ensembles must be kept to a minimum. Furthermore, composers frequently set scene complexes in orchestrally accompanied recitative, whereas in Italian opera before 1790 orchestrally accompanied recitative was still invariably reserved for emotional solo scenes and seldom accompanied action. In Mannheim, Verazi responded with his own *Ifigenia in Tauride* libretto the following year. Here the emphasis is on spectacle – shipwrecks, battles, gladiatorial games, magnificent ceremonies and processions. Formally, Verazi too builds great scene complexes; but most challenging to Italian formal tradition are the multiple ensembles – a quartet, two duets and two trios that slim down to duets and then solos. Majo responded with through-composed arias and ensembles, elaborate choruses and programmatic orchestral music. Gluck's *Alceste* had its première in Vienna in 1767, and in Stuttgart the next year Verazi and Jommelli produced their most radical collaboration, *Fetonte*. Here the multiple ensembles of diminishing personnel, the choruses, the great scene complexes and the first action finale in an opera seria cut the exit arias to less than half the usual number. As in *Alceste*, neither the exit aria nor the simple continuo-accompanied recitative has entirely disappeared, but the restoration of death and tragedy, chorus, ensemble and pantomime to the stage as well as the formal innovations look forward 20 years.

Gluck's unique contribution in *Orfeo* and the principal implications inherent in his reform efforts as they impinge on the history of *opera seria* lie in his attempts to erase the harsh lines of demarcation between action (recitative) and reflection (aria) and to create a musical and dramatic unity from diverse components of chorus, air, ballet, ensemble – a scene complex that encompasses the entire work. Secondly, he maintained a heightened dramatic intensity by confining the action to a single central argument taken from classical Greek sources. Calzabigi's libretto is *sui generis*: it is neither a translation of a French opera nor an Italian opera with French elements. There are no secondary characters, and there is no attempt to provide scenes with arias for the third-ranking ones (except for Ismene's sorbet aria at the beginning of Act 2). As a result the number of arias is greatly reduced, and various choruses step to the forefront, becoming characters in the drama and bringing the first and third acts to a close. The classical subject matter and the superimposed, divinely achieved happy ending betray its French origins even if the remnants of simple recitative and the occasional exit aria point to two of the strongest and most persistent Italian practices. The fluidity of its scene complexes and its great stretches of orchestrally accompanied recitative remain a bold challenge to formal and musical conventions in *opera seria* for the rest of the century.

4. 1770–1800. About 1770 a stylistic break was apparent on several levels, one that condemned most of the mid-century composers to rapid oblivion. The last works of Hasse and Jommelli, composed for Italy in the early 1770s, were not particularly successful, and Galuppi wrote his last serious opera in 1772, 12 years before he died. Traetta spent most of his years after 1770 in St Petersburg. The major figures replacing them were Piccinni, Sarti, Sacchini, Anfossi, Salieri, Paisiello and Cimarosa, and among non-Italians J.G. Naumann, Haydn and Mozart. There was some overlapping of generations: Piccinni managed to modify his style and to stay active into the last decade of the century, including a successful sojourn in Paris, where he was placed in competition with Gluck. Near the end of his life he made yet a second transition to the new Venetian style in his *Ercole al Termedonte* (1793, Naples). These composers were melodists in a more modern style, using a greater variety of aria forms including a new popular favourite, the expressive RONDÒ (a two-tempo aria, slow–fast). Paisiello

3. Final scene of Act 3 in the original production of Giuseppe Colla's 'Didone', Teatro Regio, Turin, Carnival 1773: design by Fabrizio Galliari, pen and ink with wash (Fondazione Giorgio Cini, Venice)

appears to have been a leading figure in the establishment of the new style. His broad, simple melodic lines and longer periods took centre stage, while accompaniment styles carried over entire sections with little change and seldom stepped out of the role of beat-keeping repeated notes or arpeggiation except to insert brief obbligato motif 'comments' during vocal caesuras. Orchestras had become larger, making the contrast between segments for full orchestra and the thin string accompaniments maintained during the vocal sections even greater than before. Great crescendos of thickening texture and quickening rhythmic motion combined with expansive displays of vocal *fioritura* to articulate major sections.

During the 1770s da capo and dal segno aria forms quickly disappeared in favour of various types of through-composed ternary, binary and rondo forms that shared characteristics with instrumental sonata and concerto forms. By the 1780s, most operas showed a combination of very long arias, some based on three strophes of poetry, with very short ones often based on only one. The climactic arias for the principal roles was usually a rondò. Only the newly fashionable minuet retained the da capo form. The number of arias per opera continued to decline, from about 15 during the 1780s to fewer than ten in the 1790s. The third act often had only one or two scenes and sometimes disappeared completely. Ensembles took the place of the solo scenes and arias at the ends of Acts 1 and 2. They no longer took the prevailing aria forms but were through-composed, usually with one or more tempo changes moving from slow to fast. During the 1780s, the final *coro* began to expand to include soloists. These as well as the ensemble finale gradually began to fluctuate in personnel and to incorporate action. After 1785, finales that function in the same way as those of comic opera appeared in *opera seria* in all the major musical centres. The extensive action finales in Paisiello's *Pirro* (De Gamerra; 1787) were neither the first (they had earlier appeared in operas to librettos by Verazi) nor the only ones of that year, though they were certainly new to the Italian operatic mainstream, as De Gamerra claimed in his preface. In the mid-1790s action ensembles moved to the interiors of acts when the scene complex became the preferred closing construction. During the 1780s scenes realized in obbligato recitative became more common and longer. They became quite elaborate, involving wind instruments, and combining obbligato commentary during vocal caesuras with *accompagnato* chords or tremolo during the vocal declamation, and occasionally moving into measured style or cavatina; often they were the ravings of a character insane with fear and dreadful imaginings. They remained introspective solo scenes for the principals until the late 1780s, when they began to encompass action.

Metastasio's librettos still provided a substantial proportion of the repertory, enduring the usual cuts in recitatives and arias, the substitution of new texts, the addition of a scene for the sorbet aria, the condensing of act endings into ensembles, the omission of choruses, and the combining of the second and third acts into one. As the number of arias shrank, the number of exits without aria increased, giving rise to many compound exits at the end of an aria and the practice of having the remaining character deliver a short speech before an aria-less exit. Among the steady supply of new librettos, a goodly number originated in French librettos and plays.

The 1780s were a decade of experimentation and innovation, but actual change in the make-up of the theatrical repertory came gradually, and most operas remained solidly based in traditional practices and precepts that harked back to the Arcadian reform. These did not truly begin to give way until the 1790s. Not surprisingly, among the most widely performed operas of the decade were settings of *Medonte*, to the innovatory librettist De Gamerra's most conservative libretto, and of Giovannini's *Giulio Sabino*, which was performed more widely and more frequently than any other *opera seria* setting in the history of the genre. Sarti's masterly settings of these librettos contributed greatly to their success. His *Giulio Sabino* (1781, Venice) shows how little mainstream *opera seria* had changed since the 1760s. Composers and librettists, when writing for the Italian public, continued

to rely mainly on the aria and on principles originating in the Arcadian reform.

In 1778 Verazi was called back to Italy from Mannheim to produce four spectacle operas for the opening of La Scala, Milan. The goals of his *drammi in azioni* differ little from those of Calzabigi and Gluck in *Alceste*. His approach shares some of their means – spectacle, ballet, chorus and scene complexes connected by obbligato recitative – but the differences are pronounced. In Verazi's librettos the secondary characters and complex intrigues remain. Rather than attempt to re-create an aura of antique tragedy with a French-inspired *deus ex machina* to soften the unhappy ending, Verazi amplified the spectacular, the terrifying and the horrific and ignored the laws that proscribed death on stage and unhappy endings. The first of the new La Scala works, Salieri's *L'Europa riconosciuta*, inspired a storm of outraged protest. In the last two operas Verazi was forced to relinquish chorus and dance and to restore the exit aria without disruptive dramatic action. Apparently the Italians were willing to tolerate the multiple ensembles, the introductions and finales, and in Anfossi's *Cleopatra* the unhappy ending with two staged deaths. After 1785 these and other of his innovations gradually gained acceptance – single sex duets, arias and ensembles with interjections from others (*pertichini*) in solo, ensemble or chorus (possibly yet another borrowing from French opera), the integration of chorus and dance into the action, multiple scene complexes, and the abrogation of many of the rules pertaining to the hierarchy of singers, including a suspension of the exit-aria convention.

Verazi's innovations were not the only factors pushing Italian theatres towards change. Coltellini's French-inspired librettos received new settings for Italian theatres in the 1780s and Bertoni reset Calzabigi's *Orfeo* for Venice. Gluck's *Alceste* was performed without the usual revisions and substitutions, as an integral unit. Their multiple scene complexes, ballets and choruses remain anomalies until the 1790s, though the increasing attraction of the 'merveilleux' of French-style subjects was evident even in conservative Naples in such works as Cimarosa's *Oreste* (1783) and Paisiello's *Fedra* (1788). Turin, close neighbour to Stuttgart and Mannheim, borrowed the man- and nature-inspired spectacle but not the attendant dramaturgical innovations, a tendency observed throughout the repertory of the 1780s. Paisiello returned from St Petersburg to compose *opere serie* incorporating action ensemble finales (*Pirro*) and French spectacle (*Fedra*). He also brought a Metastasian text infused with scene complexes (*Nitteti*), which was quickly adopted by others. Marmontel's *Les Incas* offered the exotic Peruvian setting for Moretti's *Idalide* and Foppa's *Alonso e Cora*. Voltaire's tragedy *Sémiramis*, Noverre's bloodstained ballets and Alfieri's equally bloody tragedies impelled the Italians towards the restoration of tragedy and death to the stage.

Several composers working with innovatory librettists in the 1780s escaped the notice of contemporary critics and commentators. Bianchi, who became associated with Sertor, the earliest of the innovatory Venetian librettists, specialized in *opera seria* at a time when most composers were engaged in *opera buffa*. He was the first to set several of Sertor's librettos, among them the first of a number of 'morte' operas, *La morte di Cesare* (1788), a work also distinctive for the active role of the chorus as a participant in the drama. Bianchi's *Alonso e Cora* (1786), also a pioneering work, was the product of a collaboration with Foppa, another innovatory Venetian librettist probably ten years younger than Sertor. Here the extensive opening chorus, the many cavatinas of up to three strophes, and the scene complexes incorporating cavatinas, ensembles, chorus and dance that conclude Act 1 and Act 3 served to reduce the number of exit arias from about 14 or 15 to only 11. Angelo Tarchi worked with the innovatory Milanese librettist Moretti before the latter was called to St Petersburg. Their landmark opera *Il conte di Saldagna* (1787) treats a subject from medieval history in which the hero dies by design of an unrepentant ruler on stage during a celebration of his marriage. In applying French-inspired elements to plots based on human affairs rather than mythology, this opera and Bianchi's *Alonso* stepped beyond the innovators of the past and opened the door for Romantic opera of the 19th century. Prati's setting of Giovannini's libretto *La vendetta di Nino* (1786, Florence) contained the first staging of a parricide in more than a hundred years and initiated a vogue for ghost scenes.

Thus the way was paved for a group of Venetian librettists led by Sertor, Foppa and Sografi to break away from singer-dominated Arcadian reform dramaturgy and to begin providing operas with a rich variety of newly available dramatic and spectacular options. Their activities may account for the increase in the output of *opera seria* in the 1790s, especially in Venice where production nearly doubled. Choruses, ballet, introductions, finales, ensembles (including single-sex duets, trios and quartets), cavatinas and scene complexes reduced the number of arias to below ten. Arias, ensembles and obbligato recitatives increasingly carried the action. Arias often included interjections by other characters or incorporated chorus, and ensembles frequently fluctuated in personnel. Action ensembles began appearing within acts when divertimento-like scene complexes became the favoured act ending.

Divertimentos within the opera itself succeeded in absorbing the ballet, which as entr'actes had threatened to engulf the parent genre a decade earlier. Sografi led the way towards the development of an entirely new concept of operatic dramaturgy moving freely among textual options in such fluid constructions that by the mid-1790s most operas no longer fitted the traditional definition of *opera seria*. At the same time subject matter came increasingly from medieval European history, imparting a decidedly 'modern' aspect. The plot for Andreozzi's and Giordani's *Ines de Castro* (1793, Venice) was taken from medieval Portuguese history, and Trento's *Bianca de' Rossi* (1797, Venice) was a medieval Italian tragedy in which Bianca kills herself with her dead husband's falling tomb cover. There were even a few plots based on 18th-century history in locations far removed: *Cook o sia gl'inglesi in Othaiti* (anonymous, 1785, Naples) and Rossi's operas for Venice: *Pietro il grande* (1793) and *Carolina e Mexicow* (1798). These developments coincided with the social and political turmoil caused in Italy by the French Revolution, culminating in the French invasion of 1796 and engendering an egalitarian climate in which Arcadian idealism and the dramaturgy it spawned seemed increasingly obsolete. Under these conditions the most persistent of all the *opera seria* conventions – the exit aria and the hierarchy of singers – gave way, hastening the demise of 'aria' opera and its attendant

excesses. In the newly established Italian republics, rulers were no longer free of vice nor immune to violent ends. In the conclusion of Nasolini's *Merope* (Zeno's libretto reworked by Botturini, 1796, Venice), the dead monarch, victim of his own son's treachery, lies unnoticed during the victory celebrations. At the same time the principal composers of the preceding period – Cimarosa, Sarti, Paisiello and Guglielmi – were replaced by a group of new composers, including Nasolini, Zingarelli, Mayr, Paer, Portugal and Generali.

MARITA P. McCLYMONDS (with DANIEL HEARTZ)

Opera-torneo (It.: 'opera-tourney'). A tournament with music in an operatic style, cultivated mainly in the 17th century at the ducal courts of northern Italy and in Paris, Vienna and Munich. *See* TOURNEY.

Opera voor Vlaanderen. Company created in 1981 by the merging of the Koninklijke Opera companies of ANTWERP and GHENT.

Operetta (It.: diminutive of 'opera'; Fr. *opérette*; Ger. *Operette*; Sp. *opereta*). A light opera with spoken dialogue, songs and dances. Emphasizing music rich in melody and based on 19th-century operatic styles, the form flourished during the second half of the 19th century and the first half of the 20th. During the 20th century it evolved into and was largely superseded by the MUSICAL COMEDY. The term 'operetta' was originally applied in a more general way to describe works that were short, or otherwise less ambitious, derivatives of opera.

1. NATURE AND DEVELOPMENT. As a specific artistic form, what we now regard as operetta evolved in Paris in the 1850s as an antidote to the increasingly serious and ambitious pretensions of the *opéra comique* and vaudeville. It was to fill this gap that various attempts were made to establish a home for short, lighthearted operatic-style works. The particular success of Jacques Offenbach and his company at the Théâtre des Bouffes-Parisiens, offering programmes of two or three satirical one-act sketches, was such that it led to the extension of the format into works of a whole evening's duration and to the establishment of *opéra bouffe* as a separately identifiable form of full-length entertainment.

The success of Offenbach's works was not confined to France, and their popularity in other countries led to the development of various national styles. It was with the evolution of the *Operette* in Vienna during the 1870s that the term first became applied to full-length works. When English-language works were produced, the terms customarily used were 'comic opera' or 'comedy opera'; it is only in retrospect that the term 'operetta' has come to be applied to all national schools.

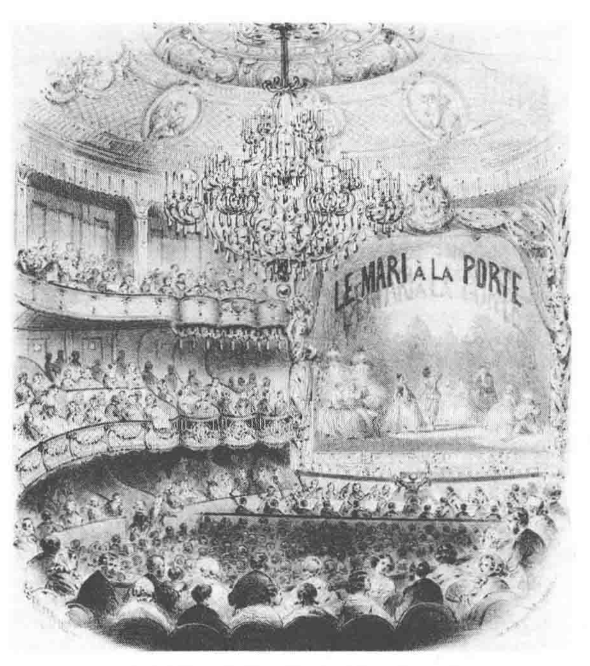
In Austria the importation of Johann Strauss into the theatre from the ballroom provided Viennese operetta with a composer to rival Offenbach. Strauss also provided the characteristic Austrian style – romantic rather than satirical and with a strong dependence on dance rhythms, especially the waltz. Meanwhile a counterpart had emerged in Spain with the revival of the ZARZUELA, §3, at first owing much to that country's Italian operatic traditions but later developing an essentially Spanish national style. The English-language counterpart, most notably the 'comic operas' of Gilbert and Sullivan, owed much to the British theatrical traditions of ballad opera and burlesque and even something to the Victorian choral tradition.

As a popular form of entertainment, the operetta reflected contemporary taste in the nature of its plots and moral attitudes as well as in topical references. As the predominant form of popular musical theatre of its time, it attracted composers, librettists, performers, managers, directors and designers. The importance of its dialogue made it even more dependent than opera upon a strong libretto. Some of its major successes involved recognized comic playwrights such as Henri Meilhac and Ludovic Halévy in France and W.S. Gilbert in Britain. Many of the most successful and enduring of 19th-century Viennese operettas also had librettos adapted from French originals, which again were often by Meilhac and Halévy. Specialist performers developed who could combine singing with acting (and perhaps dancing) ability. Although composers such as Bizet, Chabrier and Delibes tried their hand at operetta in its early years, the most successful were generally specialists in such lighter forms.

By the 1880s and 90s the expansion of the form from its one-act origins had brought it to a point where it occupied much the same position as the *opéra comique* of 40 or 50 years earlier. With the passing of many of the major practitioners of operetta and the periodic quest for change that typifies the popular musical theatre, elements of the contemporary variety theatre were increasingly incorporated in the 1890s, a trend that evolved particularly in London under the designation 'musical comedy' or 'musical play'. Where previously the logical development of the story had been of particular importance,

displays of female glamour, fashionable dress and elaborately staged routines assumed greater importance.

At least until World War I the operetta, along with the early musical comedies, retained much of its traditional grounding in 19th-century light operatic styles. Indeed it enjoyed a powerful renaissance as a new school of more sensuous Viennese operettas, exemplified by Franz Lehár's *Die lustige Witwe* (1905), gave the genre its most glittering international success. Lehár himself continued to maintain high standards of musicianship, rooted in a European classical musical training, so that he could aspire to write for the opera house while Puccini (in *La rondine*) aimed to write operetta in the manner of Lehár.



Yet after World War I, and increasingly during the 1920s, the works of André Messager, Reynaldo Hahn and Lehár that conspicuously sought to maintain classical operetta standards were becoming the exceptions in a popular theatrical scene increasingly dominated by song-and-dance musical comedy based on American vaudeville and dance-band song styles, seeking relief from the escapist, Ruritanian operetta world of dukes and princesses. To all intents and purposes the era of the classical operetta ended before World War II, though in Europe the term has continued to be attached to works that evoke European traditions.

There remains no clearly defined and universally agreed dividing line between operetta and the musical, and different lines of demarcation are drawn depending upon nationality, individual taste and prejudice. Such works as *South Pacific*, *My Fair Lady*, *West Side Story*, *Fiddler on the Roof* and *Sweeney Todd* have been seen as a modern continuation of operetta (Bordman, 1981). However, for all the undoubted operetta characteristics to be found in them, they are more precisely musicals, and their structures, production techniques and audience appeal are significantly different from those of the classical operetta.

2. France. Although it was not until the mid-1850s that what is now regarded as operetta began to emerge as a separately identifiable genre, works that would today be classified as such were already in existence. Adolphe Adam's *Le chalet* (1834) and *La poupée de Nuremberg* (1852), Massé's *Les noces de Jeannette* (1853) and Offenbach's *Pépito* (1853) had scores far more operatic in form than the collections of songs provided for vaudevilles but were nonetheless lighter and more modest than the works increasingly being accepted by the Opéra-Comique.

Adam himself had opened an Opéra-National in 1847, though the venture proved short-lived. More successful was Hervé's Théâtre des Folies-Nouvelles opened in 1854 as the Théâtre des Folies-Concertantes. However, it was with the opening of Offenbach's Théâtre des Bouffes-Parisiens during the Paris Exhibition year of 1855 that these foundations were firmly built upon (see fig.1). The works of Offenbach's repertory were initially little more than satirical sketches with just a few musical numbers. However, the improbable plots and the wit and sparkle of the productions, composed not always by Offenbach himself but also by such men as Adam, Emile Jonas and Delibes, made them the rage of Paris. Within a couple of years Offenbach was able to tour not only in France but abroad.

With a small theatre licensed initially for only three or four stage performers, Offenbach's early *opéras bouffes* or *opérettes* remained for some time necessarily modest

1. Interior of the Théâtre des Bouffes-Parisiens, Paris, during a performance of Offenbach's 'Le mari à la porte'; cover of a piano arrangement of the overture, lithograph by Bertauts after C. Bertrand (Paris: Heugel, 1859)

one-act pieces, satirical or farcical in tone, used musical scores of up to eight numbers (solos, duets, trios and quartets) and were accompanied by an orchestra of up to 16 players. The relaxation of restrictions on the number of stage performers permitted him, in 1858, to put on his first two-act *opéra bouffe*, the mythological satire *Orphée aux enfers*, which added enormously to his reputation at home and abroad and provided operetta with its first enduring masterpiece.

Although Offenbach continued to produce one-act works, the pattern for the future was set by the sequence of longer works that included, most particularly, *La belle Hélène* (1864), *La vie parisienne* (1866) and *La Grande-Duchesse de Gérolstein* (1867; fig.2). All had lighthearted and witty books by Meilhac and Halévy, satirizing the Paris of Napoleon III. They call for a full cast, chorus, orchestra of up to 30 musicians, and scores comprising some 20 to 30 musical numbers including fully developed opening numbers and finales. By the end of the 1860s the French *opéra bouffe* had grown into a fully fledged genre with characteristics that firmly distinguished it not only from contemporary vaudeville but also, in its satirical wit and popular appeal, from *opéra comique*.

After the civil war of 1869–70 and the demise of the Second Empire, Offenbach's popularity began to wane. The French public came to prefer a more romantic form of entertainment and they found it in works by Charles Lecocq, Robert Planquette, Louis Varney and Edmond Audran. Grace and refinement allied to classical musical standards were brought to French operetta by Messager. His *Véronique* (1898), together with Louis Ganne's rousing *Les saltimbanques* (1899), ensured that at the turn of the century French operetta could still be ranked as a worthy successor to the old *opéra comique*.

During the 20th century French operetta progressively lost ground in international terms to Anglo-American

2. Hortense Schneider in the title role of Offenbach's 'La Grande-Duchesse de Gérolstein', Act 1, Théâtre des Variétés, Paris, 12 April 1867: lithograph from 'L'univers illustré' (27 April 1867)

musical plays on the one hand and Viennese operetta on the other. Messager continued to uphold French musical standards, as did Reynaldo Hahn, another cultured musician who combined a more modern style with traditional *opéra comique* standards. Increasingly, however, French operetta could be typified by works that owed more to the French music-hall chanson than to operatic traditions. Since World War II the name of operetta has been kept alive by the *opérette à grand spectacle* exemplified by a series of works by Francis Lopez that began with *La belle de Cadix* (1945); these retain the operetta's taste for escapist stories, exotic locations, spectacle and effects, but have little substantial contact with the operatic format of the classical operetta.

3. Central Europe. During the late 1850s Viennese theatres began staging Offenbach's *opéras bouffes*, at times in pirated versions, but often under the composer's own direction. These in turn inspired one-act comic and satirical operettas in similar style from locally active composers, of whom the most notable was Franz Suppé.

Offenbach's virtual monopoly of larger-scale productions remained unchallenged in Vienna until Johann Strauss (ii) was recruited from the dance hall. Strauss introduced the distinctively Viennese operetta style, with more exotic settings, romantic rather than satirical stories, and scores built around dance forms, especially the waltz. His *Die Fledermaus* (1874), based on a play by Meilhac and Halévy, became the most widely celebrated of all operettas, though he lacked the greater theatrical flair displayed in works such as Suppé's *Boccaccio* (1879) and Carl Millöcker's *Der Bettelstudent* (1882).

Thereafter Strauss demonstrated ambitions to move towards full-scale opera, most notably in *Der Zigeunerbaron* (1885). The major operetta successes of the 1890s came from composers who favoured a more relaxed, more charming and insinuating style, especially Carl Zeller and Richard Heuberger. In the early 20th century the classical operetta found a new lease of life when Lehár perfected his technically assured, sensuous musical style in *Die lustige Witwe*. It achieved the most wide-ranging contemporary success of any operetta and was followed by a string of internationally successful works, by Lehár himself, Oscar Straus and Leo Fall.

Before World War I temporarily restricted the international currency of Viennese operetta, these three composers had been joined in the forefront of the Viennese school by Emmerich Kálmán, who fused the Viennese waltz style with an intensely rhythmic Hungarian sound. Kálmán's contribution highlighted an extension of operetta's field of play, for he had begun his career in a burgeoning Hungarian school of operetta. The taste for Lehár also struck an especial chord in Italy, later inspiring native Italian works such as Virgilio Ranzato's *I paesi dei campanelli* (1923).

However, shifts in the political and popular musical balance had moved the centre of German operetta to

Berlin, and it was with works such as Paul Lincke's one-act 'spectacular burlesque-fantasy operetta' *Frau Luna* (1899) that a recognizably different Berlin school of operetta emerged. Later, the considerable international success of Eduard Künneke's *Der Vetter aus Dingsda* (1921) helped to consolidate the shift of the centre of German-language operetta production to Berlin, which saw the premières of works of Viennese composers, such as Fall's *Madame Pompadour* (1922) and Lehár's *Das Land des Lächelns* (1929), with the tenor Richard Tauber. By now the German operetta formula provided less for an integrated set of characters than a series of operatic-style solos and duets for the leading soprano and tenor, interspersed with comic duets for a *buffo* and soubrette and supported by choral contribution. Moreover, in Lehár's works the often zany plots of 50 or 60 years earlier were now replaced by stories with unhappy endings.

Signs of the terminal decline of the classical operetta could now be found not only in the raiding of melodies by the classical masters for 'new' works, but also in works such as Paul Abraham's *Viktoria und ihr Husar* and Ralph Benatzky's *Im weissen Rössl* (both 1930) that sought to combine the traditional romance of operetta with modern stories and dance styles.

4. BRITAIN AND THE USA. In London, too, English versions of Offenbach's *opéras bouffes* began to appear during the 1860s, and it was directly under the influence of Offenbach's *Les deux aveugles* (1855) that Arthur Sullivan composed *Cox and Box* (1866). The series of works on which Sullivan collaborated with W.S. Gilbert between 1871 and 1896 (including *HMS Pinafore*, 1878; fig.3) swept the stages of the English-speaking world, though success in translation was limited by the distinctively British nature of both humour and music. Other British examples came from Frederic Clay, Alfred Cellier, Edward Solomon and Edward Jakobowski.

It was especially in London, during the 1890s, that a trend emerged that was to have fundamental significance for the development of operetta and the popular musical theatre. At a time when imported French operettas and the native comic operas of Gilbert and Sullivan were losing their immediate appeal, the London public took readily to the style of show loosely termed 'musical comedy' or 'musical play'. Sidney Jones's *The Geisha* (1896) retained much of the comic opera tradition of Sullivan and proved a phenomenal contemporary success not only throughout the British Empire but around the world, receiving more performances in Germany than any contemporary native work. Other shows, however, were concerned less with the integrity of the libretto than with a more immediate appeal, with an emphasis on contemporary fashion, glamorous male and female chorus lines, catchy interpolated numbers, and specially staged song-and-dance numbers.

Sullivan's acknowledged comic opera successor was Edward German, with *Merrie England* (1902) and *Tom*

3. *Closing scene of Gilbert and Sullivan's 'HMS Pinafore', Act 2, Opera Comique, London, 1878: colour lithograph by Alfred Concanen*

Jones (1907). In commercial terms, however, it was the Edwardian 'musical plays' that captured the public fancy with their light songs and dances, elaborate chorus routines and fashionable dress. Through them the British musical theatre product was, for a few years at the beginning of the century, the most readily exported school of operetta.

The Edwardian musical play reached its zenith in such works as Paul Rubens's *Miss Hook of Holland* (1907), Monckton and Howard Talbot's *The Arcadians* (1909) and Lionel Monckton's *The Quaker Girl* (1910). Thereafter the genre faded rapidly in favour of, first, the Viennese operettas of Lehár, Strauss and Fall, and then ragtime-inspired revue and song-and-dance musical comedy from America. Only in the special conditions of wartime did the glamorous Edwardian-style musical show enjoy a brief revival of fortune, in *The Maid of the Mountains* (1916), with a score by Harold Fraser-Simson and additional numbers by James W. Tate, and the 'spectacular musical tale of the east' *Chu Chin Chow* (1916), with music by Frederic Norton.

During the 19th century, European works had been readily welcomed in the USA, where a significant body of native works had also begun to emerge in the 1890s. Among those that owed allegiance to the example of Gilbert and Sullivan were Reginald De Koven's *Robin Hood* (1891) and John Philip Sousa's *El capitan* (1895), while Victor Herbert's *The Fortune Teller* (1898) and Gustave Kerker's *The Belle of New York* (1897) followed the trend towards melodically more ingratiating works.

British taste embraced American musical comedy during the 1920s, but the lingering taste for works in the older European operetta traditions was still catered for in the USA by works such as Sigmund Romberg's *The Student Prince* (1924) and Rudolf Friml and Herbert Stothart's *Rose-Marie* (1924), and in Britain by Noël Coward's *Bitter Sweet* (1929) and Ivor Novello's *The Dancing Years* (1939).

5. THE MODERN SCENE. Today operetta is scarcely to be found in the commercial theatre and, apart from a few works that have been accepted into the operatic repertory, it has become increasingly of interest to a specialist audience.

The revival of classic operettas raises difficult questions. For popular consumption, librettos are deemed to need modernizing to remove references unintelligible to a present-day audience, but for a more intellectual audience, those dated contemporary references constitute much of the essence of a work. Absorption of operetta into operatic repertories also raises other questions of style, since operetta performance requires a range of talents not to be found in the typical opera performer, including an ability to put across words in both song and dialogue and to scale down the grand-opera style of projection.

Fidelity to the original has been affected by other factors, notably the desire of opera singers for vocal challenge and greater vocal contrasts, which has influenced the public conception of the voices for which roles were conceived. By pushing up a voice trained in a lower register, a more brilliant effect can be achieved than would be the case with music written for a more restricted voice range. This has led to the taste for giving soubrette roles to a mezzo-soprano or tenor *buffo* roles to a baritone.

If striking a balance between authenticity and tradition thus poses particular problems, operetta nevertheless continues to enjoy its small specialist niche. In Germany, Austria and other central European countries, classic operettas continue to be staged professionally as lighter fare in the repertory of subsidized opera companies. The Volksoper in Vienna remains above all as the standard-bearer of the Viennese operetta tradition, with a repertory of operettas supplemented by the lighter operatic fare. Operetta productions at summer festivals in spa towns help to perpetuate the tradition. Likewise, in France, productions of classical French and foreign works enjoy weekend productions in major towns, as well as in the summer festival at the spa town of Lamalou-les-Bains.

That a substantially different situation has developed in English-speaking countries is due to two particular factors. The first is the overwhelming success of the Savoy operas, which have long eclipsed other works from before World War I. Works such as Monckton's *The Arcadians* and *The Quaker Girl* at least enjoy occasional amateur productions, but Jones's *The Geisha*, despite surviving into modern times in the operetta repertory in continental countries, has virtually disappeared from the British scene. The second factor is the growth of a strong native-language successor in the form of the American musical, which has largely superseded earlier traditions. The D'Oyly Carte Opera Company, for so long able to tour continuously with an unrelieved diet of Gilbert and Sullivan, finally expired from a static repertory, declining audiences and increased costs.

Increasingly, then, the international survival of the major operettas has been achieved through their establishing a place in the repertory of opera companies – a tradition that dates back to the production of *Die Fledermaus* under Mahler at Hamburg in 1894. In Britain a rediscovery effort was made during the 1960s by Sadler's Wells Opera, beyond which the most significant revival of classical operettas in London has been by student companies and by the privately financed John Lewis Music Society, whose operetta productions have covered Chabrier, Lecocq, Messager, Planquette, Suppé and Millöcker. In the USA, similarly, productions of Herbert, Lehár and Romberg at the New York City Opera have been more liberally supplemented by revivals of Sousa, Lecocq, Offenbach, Kálmán and Johann Strauss at festivals at Wooster, Ohio, and elsewhere.

ANDREW LAMB

Ophibariton (Fr.). *See* RUSSIAN BASSOON.

Ophicleide (Fr. *ophicléide, basse d'harmonie, contrebasse d'harmonie*; Ger. *Ophikleide*; It. *oficleide*). A keyed brasswind instrument, the bass member of the family whose soprano is the keyed bugle (it is classified as an AEROPHONE: trumpet). It was patented by the French maker Halary (Jean Hilaire Asté) in 1821. The word 'ophicleide' was compounded from the Greek 'ophis' (a serpent) and 'kleis' (a cover or stopper); however, the ophicleide differs from the SERPENT, even from those late types in which direct fingering was abandoned and all toneholes were covered by keys. 'Ophicléide' was the name given by Halary to the largest of the family of instruments covered by his patent, but it has come to be used for other sizes. The name was later extended to other instruments of like tessitura and use: some early valved basses were known as 'valved ophicleide', 'ophicléide à piston' or 'Ventilophilsleide' (see below). The tone of the instrument is full and resonant, having some of the characteristics of both the saxophone (which developed from it) and the euphonium (which replaced it). The derogatory comments of some musical historians of an earlier generation were seen to be unjustified at the end of the 20th century, when playing of a high standard could again be heard. Composers such as Berlioz, Mendelssohn, Schumann, Verdi and Wagner wrote important parts for it; its characteristic tone in their works is rarely well replaced by the modern orchestral tuba.

Ophicleide is also the name of an ORGAN STOP.

1. Description. 2. History. 3. The valved ophicleide.

1. DESCRIPTION. The bore of the ophicleide, apart from the final bell flare, is close to the frustum of a cone, and large for an instrument of its length. The bass in 8′ C has a sounding length of 2·47 metres. The tube is bent in the form of a U, the limbs being only about 1·25 cm apart. The narrower limb terminates about 30 cm short of the bell rim with a cylindrical socket into which the crook fits. The crook, usually either circular or oval, receives at its narrow end the mouthpiece, which stands approximately at right angles to the main tubing. The oval form of crook, typical of later ophicleides, usually incorporates a tuning-slide. The mouthpiece is similar to that of a bass trombone, though individual players have preferred different designs. Some ophicleides have been built of wood, either leather-covered like serpents (the British 'serpentcleide') or highly polished, but most are of brass.

Ophicleides have been built with nine to 12 keys, 11 being by far the commonest number. The nearest to the bell stands open at rest and is closed to sound the lowest note; all the others stand closed. The tone holes are wider than the serpent's. The touchpieces controlling the keys are in two groups, arranged to be played with the left hand above the right, as with the bassoon. In early ophicleides the key-heads were flat discs, faced with leather, which closed down on short chimneys surrounding the holes; later instruments had cupped key-heads with stuffed pads. With all the keys unoperated, the bass ophicleide in C can sound the lowest eight or so natural notes of a conical tube with the fundamental 8′ C, that is *C*, *c*, *g*, *c′*, *e′*, *g′*, *b♭′*, *c″* (that is, the first eight or so pitches of the harmonic series). Closing the lowest key lowers the series by a semitone; on an 11-key instrument the keys provide the player with 12 effective tube lengths whose fundamental notes are a semitone apart, giving a fully chromatic compass of three octaves or so. For notes above *f♯* duplicate fingerings are possible since their frequencies occur among the harmonics of more than one series. Some notes require, and many notes are improved by, 'venting', i.e. operating one or more keys nearer to the bell than the principal key for that note. Some later instruments have overlapping touchpieces to facilitate this. The choice of fingering and venting is not standardized and instruction books differ. Fingering chart from A. Héral's *Méthode pour neuf, dix et onze clés* (Paris, n.d.), indicates the commonest fingerings (keys 3 and 5 are for the thumbs and are not visible in the plate). The nine-key ophicleide requires the simultaneous operating of adjacent keys for two notes in the bottom octave, but gives each finger only one key to control (L4 is never used).

While the ophicleide undoubtedly surpasses the upright serpent and the bass horn in power and clarity, it does have defects. As with other keyed brasswind instruments,

Bass ophicleide in C by P.L. Gautrot, Paris, c1850 (Royal College of Music, London)

notes requiring the opening of keys remote from the bell are generally poorer and weaker than others. Even when the fundamentals (pedal notes) are naturally well in tune, overblown notes with the same fingerings are not always so. A skilled player can minimize the tonal discrepancies and play in tune by judicious fingering and lipping. The instrument's power, though impressive when it first appeared, is no match for modern orchestral brass.

The ophicleide has been built in a number of sizes. The best-known instruction book, the *Méthode complète d'ophicléïde* (Paris, n.d.) of V. Caussinus and F. Berr, mentions no fewer than six: altos in F or E♭, basses in C or B♭ and contrabasses in F or E♭. Basses have been by far the most common, and the C more common than the B♭. A contralto in A♭ is also known (an example is in the *Musée de la Musique*, Paris).

The alto ophicleides, originally called 'quinticlaves' by Halary, were not used in the orchestra, and in bands they were soon replaced by valved instruments such as the clavicor. Contrabass ophicleides (known as 'monster ophicleides') were pitched in 12′ F or 13′ E♭.

2. History. The ophicleide may owe its origin to some form of upright serpent. A more plausible, though still unsubstantiated, story is that while reviewing allied troops after Waterloo the Grand Duke Konstantin of Russia was so impressed by the playing of John Distin, solo keyed bugle in the Grenadier Guards Band, that he requested a copy of Distin's instrument. Distin complied by taking his bugle to Halary in Paris to be copied. In 1817 Halary submitted to the Institut de France, the Académie Royale des Beaux Arts and the Athénée des Arts three instruments which he called, respectively: 'clavitube' (a normal keyed bugle despite his description of it as 'trompette à clef'); 'quinticlave' (an alto ophicleide built in upright form); and 'ophicléide' (the bass instrument known today). These were patented in 1821, with a supplementary coverage for three additional keys on the ophicleide in 1822. The nine-key ophicleide of 1821, however, seems to have been the basis of future work. A number of design modifications were proposed and patented by various makers in France and Britain (where the instrument was most used) but none found widespread acceptance apart from the cupped key-heads mentioned above and the use of pillar, rod and axle key-mounts rather than saddles. For example, by 1861 Gautrot *aîné* (the most prolific maker of ophicleides) had introduced a model with six keys and one valve, but few seem to have been made. Two unpatented improvements were the 12th key (for G♯, which eliminated some slurring problems) and the large vent hole near the bell associated with the English virtuoso, Samuel Hughes (1825–*c*1895).

There were a number of celebrated ophicleide soloists, although by far the most widespread use of the instrument was as the bass in bands, with occasional solos extending in to the tenor range. V. Caussinus was the only ophicleidist of whom Berlioz spoke highly. William Ponder (*d* 1841) introduced the contrabass ophicleide to Britain at the 1834 Birmingham Festival. Prospère (Jean Prospère Guivier) performed, also on the contrabass, at music festivals and in Jullien's promenade concerts, also accompanying the latter on his tour of the USA. Hughes was able to make a career as an ophicleide soloist, playing in the principal orchestras, for the Royal Italian Opera, Covent Garden, for the professional Cyfarthfa brass band, and as a professor at Kneller Hall and the Guildhall

School of Music (the latter appointment in 1888 probably merely titular).

The ophicleide was very widely used in France, in both bands and orchestras; after about 1870 it ceased to be scored for by composers, but its replacement by valved instruments such as bass and contrabass saxhorns it was more protracted. In Britain it was in use by the late 1820s, but in the leading brass bands it was being rapidly replaced by valved instruments by 1860 – the best ophicleidists were presented with euphoniums as contest prizes. In other European countries it was less used, but is reported to have survived in Spanish churches and remote Italian village bands into the 20th century.

3. THE VALVED OPHICLEIDE. By 1836 Guichard had brought out a valved ophicleide, preserving the shape and general bore profile of the keyed ophicleide but with three valves – virtually a primitive tuba. Three valves do not provide a complete octave of fundamentals, however, and give intonation problems when the valves are used in combination. The French orchestral tuba in 8′ C overcame these defects by the use of five or six valves (*see* TUBA). Subsequent models of valved ophicleide such as those of Uhlmann (Vienna, 1839) preserved the familiar overall shape of the ophicleide but employed a tube length of 12′ F (which gives the complete chromatic compass from *B′* upwards of the C ophicleide) or longer. There is no clear distinction between these instruments and bombardons or narrow-bore tubas.

REGINALD MORLEY-PEGGE/PHILIP BATE, STEPHEN WESTON/ARNOLD MYERS

Opie, Alan (John) (*b* Redruth, Cornwall, 22 March 1945). English baritone. He studied at the GSM and the London Opera Centre, where he sang Gianni Schicchi. He made his début in 1969 as Papageno with Sadler's Wells Opera in Liverpool, then sang Rochefort (*Anna Bolena*) in Santa Fe (1970), Sid (*Albert Herring*) at Wexford (1971) and Demetrius for the English Opera Group (1972). Since joining the ENO in 1973, he has sung a wide variety of roles, ranging from Rossini's Figaro and Dandini, Guglielmo and Valentin, to Balstrode, Junius (*Rape of Lucretia*), Cecil (*Gloriana*) and Oblonsky in the première of Hamilton's *Anna Karenina* (1981). He made his Covent Garden début in 1971 as an Officer (*Barbiere*), returning for Ping, Hector (*King Priam*), Mangus (*The Knot Garden*), Dr Falke, Paolo (*Simon Boccanegra*) and Faninal. Opie has sung Sid, Mozart's Figaro, Balstrode, the Traveller (*Death in Venice*) and Don Alfonso at Glyndebourne, Baron de Gondremarck (*La vie parisienne*) and Robert Storch (*Intermezzo*) for Scottish Opera, and Diomede (*Troilus and Cressida*) and Miller (*Luisa Miller*) for Opera North. He has also appeared in Paris, Chicago, Cologne, Amsterdam and Munich, and made his Metropolitan début as Balstrode in 1994. A charismatic actor with a strong, vibrant voice and vivid diction, he scored a major success as Beckmesser with the ENO (1984) and at Bayreuth (1987), and has recorded the role with Solti. Notable among his other recordings are Rossini's Figaro, Diomede, Smirnov (*The Bear*) and several of his Britten roles.

ELIZABETH FORBES

Opieński, Henryk (*b* Kraków, 13 Jan 1870; *d* Morges, nr Lausanne, 21 Jan 1942). Polish composer, conductor and musicologist. He studied in Kraków with Żeleński and in Prague with Lachner for the violin. In Paris he was a pupil of Paderewski (piano) and of d'Indy at the Schola Cantorum. He took lessons with Heinrich Urban in Berlin and completed his education in Leipzig (1904–6) with Nikisch (conducting) and Riemann (musicology). In 1908 he was appointed conductor of the Warsaw Opera and in 1911 he founded the first Polish musicological periodical, *Kwartalnik muzyczny*. He lived in Switzerland between 1914 and 1919, organizing concerts, lecturing on Polish music and founding in Lausanne the vocal ensemble Motet et Madrigal. From 1920 to 1926 he directed the Poznań Academy of Music, and in 1923 he became editor of the *Przegląd muzyczny*. Returning to Switzerland in 1926 to settle in Morges, he was chairman of the Société Vaudoise de Musique (1932–6). Opieński's music was influenced by d'Indy and by French grand opera; his use of Polish folklore was shaped by the Moniuszko tradition. His music has little individuality, but the symphonic poems, the *Thème varié* for piano and some of the songs are brilliant and well crafted. (*PSB*, M. Perkowska; *SMP*, J. Prosnak)

TERESA CHYLIŃSKA

Opilionis, Othmar (*fl c*1440–50). ?Polish composer. He and his brother matriculated at the University of Kraków in 1441 as members of the household chapel of the Bishop of Kraków and as being from Jawor. His only extant composition is a textless song which was copied into *I-TRcap* 93 (no.1831) by about 1450 with the ascription 'Othmari opilionis'; it is very much in the style of a French rondeau from about 1440, with imitation at the octave. (For further discussion see *StrohmR*.)

DAVID FALLOWS

Opitiis, Benedictus de (*b c*1476; *d* Aug/Sept 1524). ?German organist and composer. Early scholarship confused him with Benedictus Ducis and Benedictus Appenzeller (see Bartha). According to Jan de Gheet's sumptuously illustrated *Lofzangen ter ere van Keizer Maximiliaan en zijn kleinzoon Karel den Vijfden* (Antwerp, 1515/*R*), he was the son of 'Petrus de Opicijs montiferatensis, maiestatis Caesarie familiaris domesticus et negotiorum gestorum', suggesting that Petrus, possibly from the village of Kopitz near Eisenberg (Montiferata) near the German–Czech border, was in the employ of Emperor Maximilian I.

In 1492, while in Strasbourg with the Emperor, Petrus's youngest son, then 16, was cited as a remarkable organist. In 1505 the family was in Antwerp, and by 1513 Benedictus had secured a post as organist for the wealthy Marian confraternity of the church of Our Lady; there he worked with the organist Jacob van Doirne. In 1515 he held the title of Prince of the St Luke guild of artisans, and in that capacity headed the rhetoricians' chamber known as the Gillyflower (*Violieren*) which was linked to the guild. In February of that year the guild won the highest prize for their participation during the grand entry into Antwerp of Archduke Charles, the occasion documented in de Gheet's *Lofzangen*. In February 1516 the Antwerp church archives note Opitiis's long service and his departure for England.

In July 1516 'Benet de Opitiis, player at organ' was appointed to serve Henry VIII, and in 1518 he purchased a regal for the royal court. He joined the London church musicians' guild of St Nicholas in 1520, and from 1519 until 1521 held a licence to export beer and wine from England to the Continent. He may have been the English organist who performed along with Jean Mouton in June 1520, when Henry VIII and François I met at the Field of Cloth of Gold, and it is equally possible that he took part in the July 1520 festivities at Calais for Henry VIII and Charles V. Opitiis's will was proved on 16 September 1524.

Opitiis's two surviving works, the four-voice Marian motets *Sub tuum praesidium* and *Summae laudis, O Maria*, were published in de Gheet's *Lofzangen*, which was the earliest polyphonic print issued in the Low Countries, with elegant woodcut music in choirbook format. The print suggests that the works date from 1508, before the deliberations leading to the League of Cambrai. They may have been written for the imminent Roman coronation, or for the visit to Antwerp in September 1508 of the Emperor Maximilian and his grandson Charles, on which occasion Charles was declared margrave of the Holy Roman Empire. *Summae laudis* makes reference to Maximilian and also to the recent discovery of a new trade route to the Indies via the Cape; the work may be modelled on Isaac's *Virgo prudentissima*, which has a similar text and was also written about 1507–8. *Sub tuum praesidium* appears also in a manuscript of 1516 prepared for Catherine of Aragon and Henry VIII (*GB-Lbl* Royal 11.E.xi). Although criticized by Dunning, the two motets, structured with paired imitation, reflect the work of an adequate composer of the Josquin-Isaac era.

KRISTINE FORNEY

Opitz, Martin (*b* Bunzlau [now Bolesławiec], 23 Dec 1597; *d* Danzig [now Gdańsk], 20 Aug 1639). German poet. In 1620 he was forced to leave the University of Heidelberg, where he was a student, because of the Thirty Years War and travelled to Leiden, where he met the Dutch poet Daniel Heinsius, who greatly influenced him. He taught for a time at the Gymnasium in Weissenburg, but by 1625 he was in Vienna, where he was crowned poet by Emperor Ferdinand II. Opitz was a Protestant, but when he entered the service of Count Karl Hannibal of Dohna (Silesia), who was strongly Catholic, the two worked closely together, going on a political mission to Poland which resulted in Opitz's ennoblement by the emperor. In 1630 he was in Paris. After the Catholics were defeated in Silesia he entered the establishment of a Protestant duke and served as a liaison officer for the Swedish general staff. Opitz was forced to flee when Silesia became Catholic again in 1635. He went first to Toruń and then to Danzig, where he worked as historian and secretary at the court of King Władisław IV. He visited Königsberg in 1638 and died of the plague the following year.

Opitz outlined German poetics in his treatise *Buch von der deutschen Poeterey* (1624) and provided poetic examples of these rules in his *Teutsche Poemata* (also 1624), the first edition of which he subsequently revised according to the new rules set forth in his poetics. Opitz is widely regarded as the father of modern German poetry. He received the patent of nobility in 1627 and was made

a member of the foremost German literary society, the Fruchtbringende Gesellschaft, in 1629.

The prime musical interest of Opitz's texts lies in the insistence on a correspondence between natural word stress and metrical stress, which produced poetry that was natural, graceful and readily set to music. His poems were set by many 17th-century composers, including Heinrich Schütz, for whom he provided the libretto of *Dafne* (Breslau, 1627), a German paraphrase of Rinuccini's work set by Jacopo Peri. Performed at a Saxon court festival on 13/23 April 1627, *Dafne* is widely regarded as the first opera in the German language; the music is no longer extant. Opitz's libretto may have served as a model for another *Dafne*, by M.G. Peranda and G.A. Bontempi, which was performed at the Dresden court in 1671.

Opitz's *Judith* (Breslau, 1635), a reworking of Andrea Salvadori's Italian text for Marco da Gagliano, has frequently been associated with Schütz's name, since Opitz undertook the translation after the collaboration on *Dafne*; however, Schütz never set this three-act libretto. In 1646 another version of Opitz's *Judith* was published in Rostock, expanded to five acts by Andreas Tscherning with its choruses set to music by Matthias Apelles von Löwenstern, Kapellmeister to the Duke of Oels. In *Dansktalende Judith* (1666), Mogens Skeel translated Opitz's *Judith* into Danish in connection with a court performance in Copenhagen; it is not known if this version was performed with music.

A hunting song, 'Auff Ihr Jäger auff! Es tagt', with text by Opitz, was inserted into Johann Lauremberg's second pair of musical dramas published as *Zwo Comoedien* and performed during the Danish royal wedding celebrations of 1634. It has been shown that this hunting song is based on the chorus of shepherds from Act 3 of *Dafne*. In the ballet performed at the Danish wedding six strophes from Opitz's *Galathee* (1621) reappear in the 'Klageliedt des Orpheus', whose fifth strophe begins 'Täglich geht die Sonne nieder'. The *Schütz Werke Verzeichnis* lists among the lost works three secular songs which can be attributed to Opitz: 'Ach liebste, lass uns eilen', 'Gehet, meine Seufzer, hin' and 'Täglich geht die Sonne unter'. This last must be considered a Schütz composition used at the Danish royal nuptials of 1634 and strengthens the assertions that Schütz did, in fact, compose the secular music for this wedding. Opitz can be considered to have provided the greatest share of secular texts set to music by Schütz; other composers who set his secular songs include Heinrich Albert, C.C. Dedekind, Caspar Kittel, J.E. Kindermann and Johann Nauwach.

Opitz's translations of biblical texts were also influential for composers such as Albert, Andreas Hammerschmidt, Jacob Hintze, Kindermann and Schütz. His translation of the Huguenot Psalter, which was meant to replace that of Ambrosius Lobwasser, found only limited popularity, however. Both Opitz and Lobwasser translated the French psalms of Marot and Bèze into patterns identical to the originals and set to Goudimel's original music. Opitz demonstrated great care for the musical setting of the texts, and his rendering subtly fits the borrowed tunes. Opitz based several collections of psalms and epistles on French originals so that they could be sung to the same Geneva tunes. Hammerschmidt composed a series of dialogues on Opitz's paraphrase of the *Song of Songs*; they make up the first 11 numbers in Hammerschmidt's *Geistlicher Dialogen ander Teil* (Dresden, 1645).

A critical edition of Opitz's works is in progress: G. Schulz-Behrend, ed: *Martin Opitz Gesammelte Werke, Kritische Ausgabe* (Stuttgart, 1968–).

MARA R. WADE

Oppens, Ursula (*b* New York, 2 Feb 1944). American pianist. She studied at the Juilliard School with Rosina Lhévinne, Leonard Shure and Guido Agosti (1966–9). She won the Busoni International Piano Competition (1969) and the Avery Fisher Prize (1976), and has subsequently performed with most leading American orchestras. She has given solo recitals in the USA, Europe and Central America, and has participated in the Aspen, Berkshire and Marlboro music festivals, among others.

Oppens was a founder-member of Speculum Musicae, the highly praised contemporary music ensemble that won the Naumburg Chamber Music Award in 1972, and has also performed with the Chamber Music Society of Lincoln Center and the Group for Contemporary Music. Although she is known particularly for the intelligence, technical skill and warmth she brings to her performances and recordings of contemporary music, she is equally at home with the standard repertory. Compositions written for her include Rzewski's Four Pieces and *The People United will Never be Defeated* (1975), Christian Wolff's *Hay una mujer desaparecida* (1979), Carter's *Night Fantasies* (1980, also for Paul Jacobs, Gilbert Kalish and Charles Rosen), Wuorinen's *The Blue Bamboula* (1980), and works by Harbison, Picker and Tower. In 1994 she was appointed John Evans Distinguished Professor of Music at Northwestern University.

ELLEN HIGHSTEIN

Opus [op.] (i) (Lat.: 'work'; Fr. *oeuvre*; Ger. *Opus*; It. *opera*). The Latin plural, *opera*, has become singular in Italian, and its plural is *opere*. To avoid confusion with the usual English or Italian meaning of 'opera', the English plural, 'opuses', may be preferred. First used for a musical composition in the Renaissance (Tinctoris, prologue to *Liber de arte contrapuncti*, 1477; Listenius, *Musica*, 1537), 'opus' was applied by early German publishers to whole collections: *Novum et insigne opus musicum* (1537–8) and *Magnum opus musicum* (1604). One of the earliest instances of a single-composer publication with opus number was Viadana's *Motecta festorum* op.10 (Venice, 1597). Biagio Marini published 22 numbered sets in Venice and other cities from 1617 to 1655. Until 1800 opus numbers were more common in instrumental than in vocal music, and they have rarely been applied to stage compositions at any period.

In the absence of corroborating information, opus numbers can never be relied upon to establish the chronology of a composer's works. Generally, numbers were not applied until publication, and then often by the publisher, not the composer. Where the same work appears with two publishers, it may have different numbers assigned to it (as with Haydn, or with Boccherini, who assigned further numbers in his own catalogue). Sometimes, as in the case of Schütz, the numbers were added later. Before about 1800 it was customary for several works to be gathered under one number, often 12 in the early 18th century, later six and then, as individual works became longer (towards 1800), three or two; the chronology may not correspond with the internal numbering (it does not in Beethoven's op.18 quartets for example). Smaller pieces, occasional compositions, youthful works and works in manuscript are not usually numbered, and miscellaneous clues must be used to fit them into the list of numbered works.

DAVID FULLER

Opus (ii). Firm of music publishers, founded in Bratislava in 1971. *See* SUPRAPHON.

Or, Josquin d'. *See* DOR, JOSQUIN.

Orafi [Oraffi], **Pietro Marcellino** (*fl* 1640–52). Italian composer. He was an Olivetan monk, who by 1652 had become an abbot of his order. His output consists mainly of sacred music – *Concerti da chiesa a 1–5 voci* (Venice, 1640) and *La cantica . . . a 2–5 voci* (Venice, 1652) – though the former includes a four-part instrumental canzona. The latter consists of settings of his own vernacular paraphrases of texts from the Song of Songs.

JOHN WHENHAM

Oram, Daphne Blake (*b* Devizes, Wilts., 31 Dec 1925). English composer, technician and inventor. Educated at Sherborne School for Girls, she turned down a place at the RCM in order to work at the BBC as a music balancer for classical music broadcasts. A pioneer in integrating music and technology, she began to experiment with sound manipulation in 1944 and in 1950 submitted her work for orchestra, five microphones and manipulated recordings to the BBC. In 1957 she established a radiophonic unit at the BBC and was one of the directors of the BBC Radiophonic Workshop when it opened in 1958. Later that year she left the BBC and set up her own studio in Kent. Her experiments in converting graphic information into sound – aided by Gulbenkian grants in 1962 and 1965 – led to the development of her Oramics system, a photoelectric digital/analogue composition machine that gives the composer control of subtle nuances in all parameters (including amplitude, envelope shaping, rhythm, timbre control, microtonal pitch and vibrato), which are drawn onto ten parallel tracks of 35mm film and then transported by a motor through the photoelectric sound-generating system. In the 1960s Oram lectured widely on electronic music and many composers, including Thea Musgrave, used her studio facilities. In the 1990s she began to convert the system to RISC computer technology, suitable for composers to use at home. A number of Oram's works were composed using Oramics, including *Broceleande* for Oramics tape (1970) and *Sardonica* for piano and Oramics tape (1972, written in collaboration with Ivor Walsworth). She has created music for films, including *The Innocents* (1961); for television and radio; for exhibitions, including *Pulse Persephone* (1965); for the theatre, including the ballet *Xallaraparallax* (1972); and for concert performance.

SOPHIE FULLER

Oratorio. An extended musical setting of a sacred text made up of dramatic, narrative and contemplative elements. Except for a greater emphasis on the chorus throughout much of its history, the musical forms and styles of the oratorio tend to approximate to those of opera in any given period, and the normal manner of performance is that of a concert (without scenery, costumes or action). The oratorio was most extensively cultivated in the 17th and 18th centuries but has continued to be a significant genre.

1. ANTECEDENTS. Distant antecedents of the oratorio may be found in the musical settings of sacred narrative and dramatic texts in the Middle Ages: the liturgical drama, the Divine Office for saints' feasts, the Passion and the dialogue *lauda*. Medieval miracle and mystery plays, as well as *rappresentazioni sacre*, are also related to the oratorio, but the real beginnings of the genre are to be found in the late Renaissance and early Baroque periods, where an ever-increasing interest in settings of dramatic and narrative texts gave rise first to opera and

1. S Maria in Vallicella, or Chiesa Nuova (right), and Oratorio dei Filippini (centre), Rome: engraving by Giuseppe Vasi from 'Delle magnificenze di Roma antica e moderna', vii (1756)

then to oratorio. Such texts were widely used for polyphonic madrigals in the 16th century (e.g. Andrea Gabrieli, *Tirsi morir volea*) and for monodic madrigals, dialogues and dramatic cantatas in the 17th century (e.g. Monteverdi, *Combattimento di Tancredi e Clorinda*). Sacred music, too, was affected by this new tendency, as may be seen in the increasingly dramatic treatment of the Passion, and in the *laude*, spiritual madrigals and motets that use dramatic and narrative texts, all of which may be considered antecedents of the oratorio. Lassus, for example, composed motets on the stories of the finding of Jesus in the Temple, the raising of Lazarus, the marriage feast at Cana, the Annunciation and Jesus on the road to Emmaus (*Fili quid fecisti nobis sic*, *Fremuit spiritus Jesus*, *Nuptiae factae sunt*, *Missus est angelus* and *Qui sunt hi sermones*, respectively); these motets are related by text, but not by music, to the history of the oratorio. In the first three decades of the 17th century, however, dialogues were composed to Latin texts based on similar biblical stories, but with greater dramatic emphasis in the new monodic style. Both in text and music such works are often close to the genre later known as oratorio, but they are brief, are normally found in motet books (e.g. Severo Bonini's 'Dialogo della madonna e del angelo' in his *Primo libro de motetti a tre voci*, Venice, 1609), and were intended to be used in church as motets.

Although oratorio has traditionally been considered to have originated within the context of Filippo Neri's Roman oratory (see below), recent research has pointed to its origin in the pan-Italian tendency towards greater emphasis on the dramatic element in sacred music. In Florence in the late 16th century and the early 17th, for example, the Compagnia dell'Arcangelo Raffaello performed dialogues comparable to those heard in Rome, and dialogue texts were composed by several Florentine poets, including Ottavio Rinuccini, Alessandro Ginori, Benedetto Rigogli and Benedetto Buonmattei (Hill, 1979). Yet Rome was particularly active in the cultivation of sacred dialogues and oratorios, and appears to have been the locale in which the genre acquired its name.

In Rome, the immediate social context from which the oratorio emerged was provided by the spiritual exercises of the Congregazione dell'Oratorio, founded by Filippo Neri (1515–95). Responding to the reforming spirit of the Council of Trent, Neri began in the 1550s the informal meetings, or spiritual exercises, for which he was to become famous. In the earliest period these meetings, for prayer and the discussion of spiritual matters, comprised only a few men, Neri's close friends and followers, and took place in his quarters at the church of S Girolamo della Carità. Those present for the exercises sang spiritual *laude* for entertainment, which Neri no doubt remembered from his Florentine boyhood, and which he considered an important element in the exercises. As the spiritual exercises grew in popularity, larger quarters were necessary, and thus an oratory (from Latin *oratio*, 'prayer'), or prayer hall, was constructed in a space above the nave of the church. In 1575 Neri and his followers, more numerous by then, were officially recognized by Pope Gregory XIII as a religious order, the Congregazione dell'Oratorio, and were given the historic church of S Maria in Vallicella, which was soon replaced by a new one still known as the Chiesa Nuova (fig.1). For the rest of Neri's life and until the mid-18th century, the Congregazione dell'Oratorio continued to increase in strength and prominence, first in Italy, then throughout Europe and in other parts of the world. Music continued to be important in the oratories, particularly those in

Italy. Sung in the 16th century by both the congregation and professionals (later only by professionals), the music functioned as edifying entertainment and was intended to attract people to the spiritual exercises.

Throughout the second half of the 16th century, as in the earliest meetings, *laude* continued to be performed in the spiritual exercises of Neri's oratory more frequently than any other genre. These are usually quite simple three- and four-part pieces in popular poetic and musical styles, but sometimes they are more complex polyphonic works (*see* LAUDA). Between 1563 and 1600 nine different *lauda* books and four reprints were published specifically for the oratorians' use. Giovanni Animuccia composed two of the books, Francisco Soto de Langa compiled probably five, and Giovenale Ancina two. The *laude* predominated in the exercises, but the more sophisticated motet and *madrigale spirituale* were not excluded, particularly for the musically elaborate *oratorio vespertino*, which took place in the oratory after Vespers on feast days during the winter months. Some of the finest musicians of Rome volunteered their services for the *oratorio vespertino*; there is some evidence that Palestrina may have been active in these exercises. Towards the end of the 16th century the *laude* used in the spiritual exercises reflected the pervading interest of the period in narrative and dramatic texts. Alaleona (*Storia dell'oratorio*, 1908), Pasquetti (*L'oratorio musicale*, 1906) and Schering (*Geschichte des Oratoriums*, 1911) saw a direct line of evolution, within the oratory, from the *laude* with narrative and dramatic texts to the oratorio in the Italian language. The number of *laude* with such texts, however, is by no means as significant as it once appeared to be, and the hypothesis that the oratorio evolved directly from the *lauda* within the confines of the oratory is now unconvincing; rather, the origin of the oratorio seems more satisfactorily explained as resulting from the general tendency to incorporate dramatic elements into music for oratories.

Of special importance for the history of the oratorio was the performance, in 1600 at the oratory at the Chiesa Nuova, of Cavalieri's *Rappresentatione di Anima et di Corpo*. This is the earliest known performance in an oratory of a large-scale dramatic work in which the solo portions are set to music in the new monodic style. Despite the location of its first performance and its significance for the development of oratorio, however, the *Rappresentatione* is not itself an oratorio, as Burney and many historians after him imagined it to be. The work – with its scenery, costumes, acting and dancing – is much longer and more elaborate than works that later came to be called oratorios (in 1600 the term 'oratorio' was not yet used to designate a musical composition). The widespread misconception of Cavalieri's famous work has led to the erroneous assumption in some writings that the earliest oratorios were staged in the manner of operas. Rather than being an oratorio, Cavalieri's *Rappresentatione* has been shown to form part of the oratorian tradition, which extended from the late 16th century to the late 17th, of using young boys as actors in spiritual plays, usually during Carnival (Morelli, 1991, pp.82–7). Some such plays included musical insertions, others *intermedi*, and still others, like Cavalieri's, were sung throughout. Another study (Gianturco, 1995, pp.175–7) argues that Cavalieri's *Rappresentatione* was the earliest 'moral opera'.

Apart from *laude*, little is known of the repertory performed in the spiritual exercises of the oratorians during the first decade of the 17th century, but the second and third decades are well represented by *madrigali spirituali* and dramatic dialogues composed for the oratorians by G.F. Anerio and others.

2. EARLY ORATORIO IN ITALY: ANERIO'S 'TEATRO'. In the 16th century and the first half of the 17th, the word 'oratorio' most commonly referred to the building (the oratory) and the spiritual exercise that took place within it. The meaning of the word was eventually broadened, however, to include the new musical genre used in the services, and the earliest documented use of it to mean a musical composition was in 1640. In that year the Roman Pietro della Valle wrote in a letter to the Florentine theorist G.B. Doni that he had composed an 'Oratorio della Purificatione' for the oratory of the Chiesa Nuova. The work is only about 12 minutes long, however, and is called a dialogue rather than an oratorio in its manuscript source. Della Valle's use of both terms, 'dialogue' and 'oratorio', illustrates the kind of terminological ambiguity that was prevalent in the mid-17th century.

About 20 years before della Valle's *Purificatione* a number of works appeared in Anerio's *Teatro armonico spirituale di madrigali* (Rome, 1619) that closely resemble many of those called oratorios in the 1640s and 1650s. The 94 compositions in this 'Spiritual Harmonic Theatre of Madrigals' all have poetic texts that are dramatic at least in a general sense, and all are based on biblical or hagiographical sources. The texts show some relationships to those of the 16th-century *laude*, but they tend to be longer and more dramatic. 14 of the madrigals are marked 'dialogo', and at least seven of these are sufficiently extended and close enough in conception to the oratorio of the mid-century to be termed oratorios: *Deh non vedete voi*, *Deh pensate ò mortali*, *Diteci pastorelli*, *Due figli un padre havea*, *Eccone al gran Damasco*, *Il vecchio Isach* and *Mentre su l'alto monte*. The longest and most dramatically developed of these, requiring about 20 minutes in performance, is *Eccone al gran Damasco*, based on the story of the conversion of St Paul. This work employs soloists for individuals (Narrator, tenor; Saul, tenor; Voice from Heaven, bass; and Ananias, tenor), a double eight-part chorus for groups within the drama (soldiers and angels) as well as for non-dramatic comments and reflections, and a five-part instrumental ensemble to play a 'Combattimento con voci & instromenti' and to double the final chorus. The music of this work, and of the *Teatro* compositions in general, is in a concertato madrigal style, with relatively conservative, contrapuntally influenced sections for solo voice and organ bass accompaniment. It is chiefly this conservative element, and the lack of distinction between recitative and aria styles, that distinguishes these early oratorios from those of the 1640s and 1650s. These works from the *Teatro* are oratorios not only in general conception but in function as well, for Anerio composed this book at the request of Oratio Griffi, the *maestro di cappella* of S Girolamo della Carità, for use in the *vespertino* services of the oratory of that church; there is also clear evidence that the book was used in the oratory at the Chiesa Nuova. Griffi was the author of the book's dedication to the deceased Neri, in which he spoke of Neri's use of music 'to draw, with a sweet deception, the sinners to the holy exercises of the Oratory', and this was the purpose of the *Teatro*.

Other works that appear to have been performed in the oratory at the Chiesa Nuova are more than 100 pieces found in three Roman manuscripts (*I-Rn* Mus.25 and 26 and *I-Rv* Z.122–30; Morelli, 1991, pp.67–72). All have Italian texts set for four to eight voices and continuo. Some are *laude*, but others are *madrigali spirituali* in the form of dramatic dialogues comparable with those in Anerio's *Teatro*. Among the composers represented in these manuscripts are Felice and G.F. Anerio, Giovanni de Macque, Ruggiero Giovannelli and Francesco Martini. Further evidences of the repertory of the Roman oratory are found in two inventories (dated 1620 and 1622) of music owned by the Congregazione dell'Oratorio in Bologna, which generally sought to follow the practices of the original congregation in Rome. These works suggest that a considerable amount of monodic music, some with dramatic texts, was used in the oratories of both Rome and Bologna during the second decade of the 17th century. Among the printed volumes listed in the inventory are Paolo Quagliati's *Affetti amorosi spirituali* (Rome, 1617), and G.F. Anerio's *Selva armonica* (Rome, 1617), *Ghirlanda di sacre rose* (Rome, 1619) and *Teatro*.

3. 'ORATORIO VOLGARE'. By the mid-17th century two closely related types of oratorio had developed, the *oratorio latino* and the *oratorio volgare*, using texts in Latin and Italian respectively. In Rome at this period the *oratorio latino* appears to have been fostered exclusively in the services of the aristocratic Oratorio del SS Crocifisso (see below), not related to but probably influenced by the oratories at the Chiesa Nuova and S Girolamo della Carità. The last-named oratories, on the other hand, seem to have concentrated on the *oratorio volgare*, which aimed at a broader spectrum of the Roman public.

It is clear from the records of the oratory at the Chiesa Nuova that music became increasingly important and elaborate there in the 1620s and 1630s under the leadership of the well-known soprano virtuoso and oratorian Girolamo Rosini (1581–1644), prefect of music for the oratory from 1623 until his death. Nevertheless, from the time of Anerio's *Teatro* to 1630 no extant music is known that documents the further development of the *oratorio volgare*. Several librettos and musical compositions dating from about 1630 to 1640, however, reveal some of the developments of that decade. The poet Ottavio Tronsarelli's *Drammi musicali* (Rome, 1632) includes four sacred texts that might have been intended to be set to music for performance in oratories; three of these are in one section or 'act' (*La figlia de Iefte*, *La contessa delle virtù* and *L'essequie di Christo*), and a fourth, *Faraone sommerso*, is a large work in three sections. In Domenico Mazzocchi's *Madrigali* (Rome, 1638) and his *Musiche sacre e morali* (Rome, 1640) there appear musical settings of portions of a long epic-lyrical poem by Giovanni Ciampoli (1589–1643), *Coro di profeti, per la festa della SS Annuntiata, cantata nell'Oratorio della Chiesa nuova*. The entire libretto was first published posthumously in Ciampoli's *Poesie sacre* (Bologna, 1648). There is reason to believe that Mazzocchi may have set the entire text to music for the oratory and selected only these excerpts for publication. This large libretto in three sections, although not called an oratorio in its source, clearly deserves that name for its remarkable length (over 500 lines of poetry) and its essentially narrative and contemplative character. Della Valle's contribution to the *oratorio volgare*, his *Dialogo della Purificatione* (*I-Rn* Mus.123), is exceptionally brief, as mentioned above, consisting of only 59 poetic lines. Apart from being the earliest extant work to be referred to as an oratorio, it is also a curious piece of experimental music: it is one of della Valle's works in which he attempted to revive ancient Greek tunings, and its performance requires specially constructed instruments if the composer's intentions are to be fully realized. Two librettos by the poet Francesco Balducci (1579–1642), *La fede: oratorio* and *Il trionfo: oratorio*, have the distinction of being the earliest printed works to bear the term 'oratorio' in their titles as genre designations. Both were published posthumously in the second volume of Balducci's *Rime* (Rome, 1645–6). *La fede* is a narrative dramatic poem of over 450 lines in two sections, labelled 'Parte prima' and 'Parte seconda'. The poem is based on the Old Testament story of Abraham's sacrifice of Isaac, and includes long narrative parts marked 'Historia', as well as roles for Abraham, Isaac, a chorus of virgins and a chorus of sages. *Il trionfo* is less than half as long as *La fede* and consists of only one section; it is essentially a contemplative, lyrical and allegorical work glorifying the Virgin, with a chorus, two brief passages labelled 'Historia' and only one other solo role, that of the Virgin.

Among the most advanced examples of the *oratorio volgare* in the mid-17th century are the following: Carissimi's *Daniele*; an anonymous *Daniele* (possibly by Francesco Foggia); Marco Marazzoli's *S Tomaso: oratorio à 5*; two anonymous works, *Giuseppe* and *Oratorio per la Settimana Santa* (the earliest known oratorio based on the Passion); and *S Caterina* (attributed to Marazzoli in Mischiati, 1962–3). The texts of these works are poetic and are based on the Old Testament, New Testament and hagiography; all are dramatic and include several characters in addition to a chorus (probably sung by an ensemble of the soloists), which represents the roles of groups within the drama and at times comments on the dramatic action. Most of these works include narrative lines labelled 'Testo', set for a soloist. All are divided into two sections, identified either as 'Prima' and 'Seconda parte' or 'Prima' and 'Seconda cantata', and each section concludes with a chorus, sometimes called a 'madrigale' in the manuscript source. Such works were performed without scenery or action, and, when they were given in an oratory, a sermon was preached between the two sections. The time required for the performance of these oratorios ranges from about 30 minutes to slightly more than an hour. The music is like that of operas and secular cantatas of the period; recitative, arioso and aria styles are all used, and the blending of two or even all three of these within a relatively brief passage is common. Among the arias the formal procedures used are the through-composed, strophic variation, ground bass and *ABA* forms, various rondo-like schemes, and binary forms with repeated sections. Ensembles and choruses use both imitative and chordal styles in the manner of the late polyphonic madrigal. Some of the works call for no instruments other than those used for the basso continuo; when other instruments are specified, they are two violins, normally used for introductions to oratorios, supporting passages during choruses and ritornellos for choruses, ensembles and arias; rarely do they accompany a solo voice.

Among the works of the mid-century that do not conform to the norm of the 17th-century *oratorio volgare*,

generally because of their more contemplative texts, are Carissimi's *Oratorio della SS Vergine* and Marazzoli's *Per il giorno della resurrezione: oratorio à 6*. A number of brief compositions (in one section of about eight to 12 minutes) of the mid-century resemble the normal *oratorio volgare* in virtually every respect except length; although some of these were certainly performed in oratories, they are rarely called oratorios in their sources (e.g. della Valle's *Purificatione*, mentioned above; Mario Savioni's brief *Oratorio per ogni tempo* is an exception). Rather, they were usually given a variety of other names, such as 'cantata', 'concerto' or 'dialogo'. Examples are Savioni's *Concerti morali e spirituali a tre voci* (Rome, 1660); in the preface of this publication the composer promised to follow these works with a book of *madrigali spirituali* for five voices, to be sung at the end of each concerto, 'thus, cantatas for oratories will be completed'. He made good his promise in his *Madrigali morali e spirituali* (Rome, 1668). Other works differing from oratorios only in their brevity were published in Agostino Diruta's *Poesie heroiche morali e sacre* (Rome, 1646) and Teodoro Massucci's *Dialoghi spirituali* (Rome, 1648).

4. 'ORATORIO LATINO': CARISSIMI AND HIS CONTEMPORARIES. From the musical standpoint the *oratorio latino* and *volgare* are not separate genres but one genre in different languages. Both developed in the first half of the 17th century in Rome, and some of the same composers set oratorio texts in both languages, using the same style for both types. From the literary standpoint, however, the *oratorio volgare* and *latino* differ considerably in the earliest period of their development: the former uses a poetic text throughout, as is normally true of *laude*, madrigals, cantatas and operas, but the latter employs a text largely in prose, as do most motets. Thus motets with narrative and dramatic texts, as described above, might be considered the chief antecedents of the *oratorio latino*.

The Roman oratory in which the *oratorio latino* first developed, the Oratorio del SS Crocifisso (near and related to the church of S Marcello), was the meeting place of a religious society of Roman noblemen called the Arciconfraternita del SS Crocifisso, founded in the 16th century. The Arciconfraternita's chief ceremonies in which music was prominent were those on the five Fridays of Lent. There is no known record of the compositions performed at the Crocifisso during the late 16th century and early 17th; evidently no corpus of music was composed specifically for this oratory, as the *laude* and Anerio's *Teatro* were for the oratories of the Chiesa Nuova and S Girolamo della Carità. Since Latin was the favoured language for the musical texts, however, motets were probably used. Among the musicians in charge of the music at the Crocifisso in the late 16th century and early 17th were some of Rome's most famous composers in both the *stile antico* and *moderno*; they included Palestrina, Marenzio, G.F. Anerio, Quagliati, G.M. and G.B. Nanino, Ottavio Catalani, Paolo Tarditi, Stefano Landi, Giovannelli, Virgilio Mazzocchi, Foggia, Loreto Vittori, Carissimi and others. Since the oratorio was beginning to develop at S Girolamo della Carità and the Chiesa Nuova in the first third of the century, as Anerio's *Teatro* indicates, it is reasonable to assume that it was also developing at this oratory and that some of the motets performed there in the same period were Latin dialogue motets with dramatic texts, like those mentioned above. In fact, the librettist Arcangelo Spagna, in his early 18th-century sketch of the origin and history of the *oratorio latino*, traced its origin directly to motets that were used as substitutes for parts of the liturgy: 'The Latin oratorios, in the beginning, were like those motets which are continually sung in the choirs of the religious and formerly were heard on every feast day instead of the antiphons, graduals and offertories'.

By 1639 oratorios appear to have been performed in the Crocifisso, for in that year the French viol player André Maugars visited the oratory and heard two musical settings of biblical stories, one from the Old Testament before the sermon and another from the New Testament after the sermon. In 1640 della Valle entered in his diary an account of a performance at the Crocifisso of a work which he called his 'Dialogo di Esther'; but he also referred to it as an oratorio in a letter to Doni the same year, and again in a letter of a few years later. The music, which has not survived, is the earliest composition with a Latin text known to have been called an oratorio by its composer. From della Valle's comments about his *Esther*, it appears to have been similar in conception and duration to his *Purificatione*, mentioned above.

Carissimi was the most significant composer of Latin oratorios in the mid-17th century. His reputation and influence as an oratorio composer extended beyond Rome and Italy to northern Europe in his own time, and more of his Latin oratorios are extant than of any of his contemporaries. Scholars have differed considerably in regard to the number of Carissimi's works with Latin texts that might justifiably be classified as oratorios, chiefly because all of the composer's autograph manuscripts of his oratorios are lost and the surviving copies, mostly French sources, bear inconsistent and questionable genre designations. (For a survey of conflicting opinions regarding the number of Latin oratorios by Carissimi, see Smither: 'Carissimi's Latin Oratorios', 1976.) Nevertheless, if one classifies as oratorios all of Carissimi's Latin works that are similar in text, musical setting and duration to other composers' works called oratorios in Italian sources of mid-17th-century Rome, one arrives at a total of 13 works which, with varying degrees of proximity to the norm of the genre, may be called oratorios. Of these 13, eight may be classed as oratorios without qualification: *Baltazar*, *Ezechias*, *Diluvium universale*, *Dives malus*, *Jephte*, *Jonas*, *Judicium extremum* and *Judicium Salomonis*. These are the longest of Carissimi's oratorios, and they require the largest performing groups, most of them making considerable use of the chorus. According to the approach to classification suggested above, five other works may be considered oratorios with the qualification that they are exceptional because of their brevity: *Abraham et Isaac*, *Duo ex discipulis*, *Job*, *Martyres* and *Vir frugi et pater familias*. The works of this group make less use of chorus; because of their brevity the term 'motet' would suit them as well as 'oratorio'.

All of Carissimi's Latin oratorios are in one section only, which is normal for the Latin oratorio of the mid-century. Eight of the texts are based on stories from the Old Testament, two on those from the New Testament and three on fragments from both; two of the texts are non-biblical. Those based on biblical stories employ primarily narrative and dialogue texts (i.e. with few contemplative sections); the narrative passages, sometimes designated 'Historicus', are set to music for one or more

soloists, an ensemble or a chorus, and the characters in the drama are represented by soloists. Exact biblical quotations of more than one or two verses are rare, but extended biblical paraphrases are common. Important in the general structure of Carissimi's oratorios are repetitions of instrumental ritornellos, of choruses, and of solo passages in aria style. The styles of the solo parts range from relatively simple recitative through a more expressive *recitativo arioso* to that of a clearly structured aria. Carissimi set some passages of considerable length in only one of these styles, but he more often mixed them within a single solo to express changing attitudes in the text, a procedure also employed in the *oratorio volgare* and in opera of this period. Relatively long, independent sections in aria style that may be called arias (but are never so called in the sources) are normally through-composed, or in *AB*, *ABB* or strophic-variation forms. The chorus plays a more prominent role in Carissimi's Latin oratorios than in most of those of his contemporaries. Usually the chorus represents a group of individuals in the drama; at times, however, it functions as a narrator or as a commentator on the action. The choruses range in size from three parts to triple choruses in 12 parts. They are predominantly chordal, and their rhythm is usually based on the accents of the text; fugal texture plays only an incidental role. In the double and triple choruses an antiphonal style is used, often with quick alternations of the choruses in which the entering chorus begins on the final pitches of the concluding one. Of special interest in Carissimi's oratorios is his careful attention to the declamation and expression of the text; he was particularly skilful in the use of rhetorical figures in music.

Most important among Carissimi's contemporaries for their Latin oratorios were Domenico Mazzocchi (seven oratorios, most of which are called dialogues, in his *Sacrae concertationes*, Rome, 1664), Virgilio Mazzocchi (one oratorio, *Ego ille quondam*, in D. Mazzocchi's *Sacrae concertationes* and in *I-Bc* Q45; his *Beatum Franciscum* in the same manuscript is better classed as a motet than an oratorio), Marazzoli (five oratorios in *I-Rvat* Chigi Q.VIII.188), Foggia (two oratorios in *I-Bc* Q43) and Bonifatio Gratiani (two oratorios in *I-Bc* Q43). Gratiani's are the only known Latin oratorios in two sections by a composer active in the mid-17th century.

5. Italy and Spain, *c*1650–*c*1720. By the 1660s the oratorio was a firmly established genre not only in Rome but also in other Italian cities, and its cultivation beyond the Alps had begun. Oratorios continued to function in a more or less devotional context in oratories; during the course of the later 17th century and early 18th, however, they were performed with increasing frequency in the palaces of noblemen, where they functioned as quasi-secular entertainments, often as substitutes for opera during Lent when the theatres were closed.

In Rome the chief centres of oratorio performances in a devotional context continued to be the oratories, particularly those of S Girolamo della Carità, the Chiesa Nuova and the Crocifisso. These oratories had become famous musical centres by the middle of the century, and during the second half of the century oratorios began to dominate their services, making the prayer hall increasingly a place of entertainment; yet the practice of preaching a sermon between the two sections of an oratorio was retained. Oratorios were also performed at educational institutions in Rome, such as the Jesuits' Seminario

2. *Beginning of Carissimi's 'Jephte' (D-Hs MC 270)*

Romano and the Collegio Clementino. Performances in an essentially secular context frequently took place in the private palaces of such patrons as Queen Christina of Sweden, Cardinals Benedetto Pamphili and Pietro Ottoboni (*see* Rome, fig.9) and Prince Ruspoli. In a private palace an oratorio performance was a purely secular affair, usually with refreshments served to the guests during the interval between the work's two sections. Oratorios continued to be performed without operatic staging in this period, but the platform provided for the orchestra and singers would at times be elaborately decorated, with a painted background relevant to the subject of the oratorio; such was the stage for Handel's oratorio *La resurrezione* when given at the Ruspoli residence in Rome on Easter Sunday and Monday, 1708. Fig.3 shows the stage for G.B. Costanzi's *Componimento sacro per la festività del SS Natale* (libretto by Metastasio), performed in Rome at the Palazzo della Cancelleria in 1727 for the annual Christmas meeting of the Arcadian Academy. This is clearly a 'concert' performance: the singers are seated (while singing, with books in their hands) in the centre of an elaborately decorated stage; string instruments are placed behind them, and the other instruments are in the orchestra pit. In the Vatican Apostolic Palace, works approximating to oratorios (called oratorios in Marx, 1992, and cantatas in Gianturco, 1993) were performed on Christmas Eve in the second half of the 17th century and throughout much of

3. *Concert performance of Giovanni Battista Costanzi's oratorio 'Componimento sacro' (the first with a libretto by Metastasio) at the Palazzo della Cancelleria, Rome: engraving from 'Componimento sacro per la festività del SS Natale in occasione della solita annua adunanza de' signori Accademici Arcadi nel Palazzo della Cancelleria Apostolica' (1727)*

the 18th. Until 1714 these tended to be in one part only; thereafter, however, most were in two parts. Among the most prominent oratorio composers active in Rome during this period were Pasquini, Stradella, Alessandro Scarlatti, Caldara and, briefly, Handel. A host of less prominent oratorio composers active there included Alessandro Melani, Antonio Masini, Ercole Bernabei, Antonio Foggia, Giovanni Bicilli, Giuseppe Pacieri, G.F. Garbi, Giuseppe Scalamani, Quirino Colombani, Gregorio Cola, G.B. Costanzi, F.C. Lanciani, Domenico Laurelli, G.L. Lulier, T.B. Gaffi and C.F. Cesarini; most of these men are named as composers in printed librettos, but few of their oratorio scores have survived. Among the oratorio librettists active in Rome were Cardinals Pamphili and Ottoboni, Sebastiano Lazarini and Arcangelo Spagna; Lazarini published a collection of ten of his librettos under the title *Sacra melodia di oratorii musicali* (Rome, 1678), and Spagna published at least 30 oratorio librettos, which appeared in his *Oratorii overo melodrammi sacri* (Rome, 1706) and *I fasti sacri* (Rome, 1720). Spagna is also important for his treatise on the improvement of the oratorio libretto, *Discorso intorno a gl'oratori*, printed at the beginning of his *Oratorii overo melodrammi sacri*. Silvio Stampiglia, G.B. Grappelli, Francesco Posterla, G.F. Rubini, Bernardo Sandrinelli and Francisco Laurentino also wrote librettos for Roman oratorios.

Other Italian cities that were important for the development of the oratorio in this period are Bologna, Modena, Florence and Venice. In Bologna, judging primarily from information given in the librettos printed there, oratorios were sponsored not only by the oratorians, at their church of the Madonna di Galliera, but by a number of other religious societies as well, including the Arciconfraternita di S Maria della Morte, the Arciconfraternita de' SS Sebastiano e Rocco, the Venerabile Compagnia detta de' Fiorentini, the Venerandi Confratelli del SS Sacramento, the Veneranda Compagnia della Carità, the Arciconfraternita della SS Trinità, the Veneranda Confratelli di S Maria della Cintura and the Confraternita de' Poveri della Regina de' Cieli. Among other places of performances were the oratory of S Domenico and the church of S Petronio. Performances of oratorios throughout the year marked a variety of occasions, including church feasts, the taking of religious vows, the visits of dignitaries and the celebration of such events as marriages or baptisms. More oratorios were performed during Lent than in any other season. Oratorios were given in both secular and sacred contexts in such Bolognese academies as the Accademia dei Unanimi, the Accademia degli Anziani and the Accademia delle Belle Lettere. Likewise in private palaces the contexts of oratorio performances were either sacred or secular. Cazzati's *Il transito di S Giuseppe*, for instance, was performed in 1665, with a sermon between the two sections, in the private oratory of the palace of the Marquis Giuseppe Maria Paleotti. Yet performances in private residences in Bologna had at times much the same secular atmosphere as did those in Rome – that of social gatherings for the entertainment of the aristocracy. Nearby Modena was closely related to Bologna in its musical life, and many of the same composers were active in both cities. The most important patron of the oratorio in Modena was Duke Francesco II d'Este, and the favoured place of the oratorio performances that he sponsored was the oratory of the Congregazione di S Carlo. Modena's period of greatest oratorio activity was 1677–1702, during which 113 performances were given (Crowther, 1992, appx 1). The repertory of oratorios given in the Bologna–Modena area included some works by composers of Rome, Venice and other cities, yet numerous local composers were also active. Among the most important were Cazzati, G.P. Colonna, Antonio Giannettini, G.A. Perti, G.B. Bononcini and Vitali. These composers and many others are represented in the Bologna and Modena libraries and archives by manuscript scores and printed librettos of oratorios. The two poets who are represented by more librettos than any other in this repertory are G.A. Bergamori and G.B. Giardini.

In Florence the Congregazione dell'Oratorio was established at the church of S Firenze in 1632 and began to perform oratorios probably in the 1650s. For the rest of the 17th century and throughout the 18th the oratorians of Florence were the most active sponsors of oratorio performances in the city. Following the lead of the Congregazione dell'Oratorio in Rome, the Florentine oratorians presented an oratorio every Sunday and on selected feast days from All Saints' Day (1 November) to Palm Sunday (Hill, 1979). Most of these oratorios, which were by native Florentine composers, are lost, but many printed librettos survive. Oratorios were also presented in Florence by the lay confraternities, in particular the Compagnia dell'Arcangelo Raffaello, the Compagnia di S Bernardino e S Caterina, the Compagnia di S Niccolò, the Compagnia di S Jacopo, and the Compagnia della

Purificazione detta di S Marco and its subsidiary, the Ospizio del Melani (Hill, 1986). Among the oratorio composers active in Florence were G.M. Casini, A.F. Piombi, G.M. Orlandini, F.M. Veracini, Carlo Arrigoni, G.N.R. Redi and Bartolomeo Felici. Of special importance among the other oratorio composers of Tuscany is G.C.M. Clari, of Pistoia (Fanelli, 1998).

In Venice the oratorians initiated their activities in 1661 in the church of S Maria della Consolazione, detta della Fava. The earliest oratorios were performed in the oratory of that church, probably as early as 1667 but at least by 1671, according to the oratorians' extant records. The account books of the oratorians show that Giovanni Legrenzi's oratorios were composed for them. The oratorians continued, with some interruptions, to present oratorios until the late 18th century (Arnold, 1986). Oratorios began to be performed in the conservatories of Venice in 1677, when the Ospedale degli Incurabili presented its first oratorio, Carlo Pallavicino's *S Francesco Xaverio*. The majority of the oratorios given at the Venetian conservatories in the late Baroque period were in Latin; these institutions and the Crocifisso in Rome were highly exceptional in Italy for their cultivation of the *oratorio latino*. Among the composers of oratorios who were active in Venice in this period, in addition to Legrenzi and Pallavicino, were Pollarolo, Caldara (until 1700), Gasparini (after 1700), Lotti and Vivaldi. Among the librettists of Venetian oratorios are Bernardo Sandrinelli, Nicolò Minato (more important for Vienna than Venice), F.M. Piccioli, G.M. Giannini, Pietro Pariati, Z. Vallaresso and J. Cassetti.

The libretto of an oratorio from about 1660 to about 1720 is an extended poem of about 350–450 lines, characteristically in two sections; when set to music its performance time is about one and a half to two hours, with those in the earlier part of the period tending to be shorter than the later ones. Oratorios in three or more sections are rare; slightly less exceptional are those in only one. Brief spiritual cantatas for two or more voices, using dialogue between characters and sometimes including narrative passages, continued to be used in Italian oratories throughout the Baroque period. These are usually designated by a term other than 'oratorio', as may be seen in Cazzati's *Diporti spirituali per camera e per oratorii* (Bologna, 1668) and G.C. Predieri's *Cantate morali e spirituali* (Bologna, 1696); a few, however, are actually given the term of the larger form, as are Ghezzi's *Oratorii sacri a tre voci* (Bologna, 1700) and Albergati's *Cantate et oratorii spirituali* (Bologna, 1714).

The chief sources of oratorio librettos are the Bible, hagiography and moral allegory. For biblical librettos, stories from the Old Testament were much more frequently employed than from the New: of the relatively few texts based on the New Testament, those on the Passion, without narrative sections and in poetic form, appear to have been the most numerous and are found mostly in the repertory of the Bologna–Modena area. Hagiographical texts were used with increasing frequency from the mid-17th century to the early 18th until they rivalled, and with some poets and composers surpassed, the number of Old Testament texts. The prominence of hagiographical subjects for oratorios has been attributed to the influence of the Counter-Reformation in general, and to that of Jesuit dramas in particular; the latter had turned increasingly to hagiographical stories of conversion since about 1590 in an effort to further the process of conversion called for by the Council of Trent. Since the oratorio was so important in Rome within the cultural milieu of the Counter-Reformation, it is not surprising that many oratorio librettos reflect aspects of Counter-Reformation sensibility: heroism, mysticism, asceticism, gruesomeness and eroticism are all present. Most prominent are the first three of these, but gruesomeness and eroticism are occasionally found. The erotic element is important in the oratorios that stress the sensual aspects of female characters such as Susanna, Judith, Esther and Mary Magdalene and emphasize love scenes of a worldly, operatic nature. The oratorio with sensual emphasis has been termed the 'oratorio erotico'. Until about the last decade of the 17th century narrative sections, usually labelled 'testo', but sometimes 'textus', 'poeta', 'storico' or 'historicus', were common in oratorio librettos; in the 18th century, however, Italian librettists virtually abandoned such narrative sections and relied exclusively on dramatic dialogue. Oratorios usually required three to five soloists throughout this period, although exceptional works in the 17th century include as many as nine to 16 solo roles. Following the lead of opera, oratorio in Italy nearly abandoned the chorus in the second half of the 17th century and the early 18th; the few choruses used in oratorios are generally quite brief, and the composer usually set the text so that they could be sung by an ensemble of the soloists who sang the dramatic roles. The requirement of a separate choral group for the performance of an oratorio is rare in Italy after Carissimi.

The development of the musical style of oratorio from about 1660 to about 1720 followed closely that of opera. This development may be divided into two phases, one from the 1660s to the 1680s, and another from the 1680s to about 1720. Even before the 1720s, early Classical style traits are clearly in evidence in the music of some oratorio composers; from the 1720s these traits grew increasingly prominent, although for some time to come they were still mixed with traits of the late Baroque style. As pointed out above, there are Roman, Bolognese-Modenese, Florentine and Venetian 'schools' of oratorio composers in the sense that certain composers wrote oratorios primarily for those centres. From the standpoint of musical style, however, the extant oratorios of these composers show far more similarities than differences; there seems to be a single, basic, 'pan-Italian' style within each phase, with only slight local variants. Thus what has often been called the 'Venetian' style in discussions of opera is found equally in oratorios of Rome, Florence, Bologna and Modena, as well as Venice; likewise, the so-called 'Neapolitan' style seems to appear as early in Venice and Rome as in Naples.

From about 1660 to about 1720 most oratorios required three to five voices to sing the solo roles, and these united in ensembles of characters and in those few numbers marked 'coro' or 'madrigale'. Among the more important characteristics of the earlier phase, from the 1660s to the 1680s, are the small number of instruments normally required (either basso continuo alone, or two or three string parts plus continuo); the free intermingling of passages in recitative, arioso and aria styles; the predominance of arias accompanied only by basso continuo; the relatively brief arias in strophic, modified strophic, binary or ternary forms (the ABB^1 form is the most common, while ABA and ABA^1 forms are infrequent, and the

designation 'da capo' is virtually non-existent); and the basso-ostinato unification of arias. The extant oratorios of Legrenzi (*Il Sedecia*, *La vendita del core humano* and *La morte del cor penitente*) clearly represent this phase in the genre's development, as do most of those by Stradella (*Ester*, *Susanna*, *S Giovanni Chrisostomo*, *S Editta* and *S Pelagia*); Stradella's *S Giovanni Battista*, one of the greatest works from this phase of the oratorio's development, is exceptional for its large orchestra, using concerto grosso instrumentation.

In the 1680s and 1690s many oratorios continued to exhibit the characteristics described above, but new styles and structures grew increasingly important and dominated by the first decade of the 18th century. Among the new characteristics are the tendency to use a larger and more colourful orchestra with concerto grosso instrumentation, the predominance of orchestrally accompanied arias, the occasional use of orchestrally accompanied recitative, the regular alternation of recitatives and arias, the predominance of the da capo form for arias and small ensembles and more elaborate coloratura passages. The arias also show a clearer stylization in their expressions of such affections as rage, vengeance, militarism, joy, lamentation, love and pastoral bliss, and in their programmatic imitations of phenomena such as birdcalls, storms, wind, ocean waves and waterfalls. Early Classical tendencies (in particular the light, simple style favouring dance rhythms, balanced phrases and homophonic textures with slow harmonic rhythm) clearly appear in the second decade of the 18th century, especially in Caldara's Roman oratorios. Of primary significance for the history of this genre are the oratorios of Alessandro Scarlatti, which reflect the development of the oratorio from the 1690s to the end of the second decade of the 18th century, except that early Classical elements are virtually absent from them. Handel's *La resurrezione* (1708) is a masterly example of the contemporary *oratorio volgare*; Vivaldi's *Juditha* (1716) mixes early Classical elements with its essentially late Baroque style and shows that the *oratorio latino* is identical in every musical respect to the more fashionable *oratorio volgare*; Caldara's Roman oratorio *S Flavia Domitilla* (1713) clearly reveals early Classical features. In Spain a tradition of oratorio composition began with the works of A.T. Ortells (*c*1650–1706). His *El hombre moribondo*, *El juicio particular* and *Oratorio sacro a la passión de Cristo señor nuestro* were performed in 1702, 1703 and 1706 respectively at the Oratorio de San Felipe Neri in Valencia (Ferrer-Ballester, 1993).

6. THE ITALIAN ORATORIO AND 'SEPOLCRO' IN VIENNA. Outside Italy the Italian oratorio was performed primarily in the Roman Catholic courts of central Europe, where it usually functioned as a Lenten substitute for the extremely popular Italian opera and thus was accessible only to the aristocracy. While the Dresden court and numerous smaller ones adopted the genre only in the 18th century, the Habsburg court in Vienna did so as early as the mid-17th century. Particularly prominent for its cultivation of Italian opera, the Viennese court also became the most important centre of sacred dramatic music in the Italian language outside Italy. Emperor Leopold I (1658–1705), both an avid patron of Italian music and a composer of at least nine sacred dramatic compositions, wrote the earliest oratorio known to have been performed in Vienna, *Il sacrifizio d'Abramo* (1660). (Leopold's two sacred dramatic works with German texts are quite exceptional for Vienna in this period because of their language.) Other patrons of the oratorio were Leopold's stepmother, Eleonora, who was the empress dowager, and the Emperors Joseph I (1705–11) and Charles VI (1711–40), both of whom were musicians. The most active period of oratorio cultivation closed with the death of Charles VI. Among the 17th-century composers of sacred dramatic music in Vienna, Antonio Draghi was the most prolific; others, in addition to Leopold I, were Antonio Bertali, Cesti, G.B. Pederzuoli, G.F. Sances and P.A. Ziani. Later composers (17th and 18th centuries) were C.A. Badia, F.T. Richter, P.F. Tosi and M.A. Ziani. The latest period of Baroque oratorios in Vienna, being in the second decade of the 18th century, is best represented by the works of Caldara and Fux; composers of oratorios for Vienna in this late period whose works show a mixture of late Baroque and early Classical styles are Giovanni Bononcini, A.M. Bononcini, F.B. Conti, Matteo Pallota, Giuseppe Porsile, L.A. Predieri and the elder Georg Reutter. Most important among the librettists of Viennese sacred dramatic works in the 17th century are Draghi and Minato; among the early 18th-century oratorio librettists of note are Pariati, G.C. Pasquini and Stampiglia. Of special significance are the two most famous 18th-century librettists Zeno and Metastasio (see below).

Sacred dramatic music at Vienna was identified by a number of terms, among them 'oratorio', 'oratorio per il santissimo sepolcro', 'componimento sacro', 'rappresentazione sacra' and 'azione sacra'. The 17th-century repertory may be generally divided, however, into two related genres, the oratorio and the *sepolcro*. The oratorio is normally in two sections, unstaged, and similar in virtually every other respect to the *oratorio volgare* of the second half of the 17th century in Italy; its general function was also similar, as both were Lenten substitutes for opera, but its immediate context differed, for it was performed in a court chapel as a part of a semi-liturgical service. The 17th-century *sepolcro*, which was often termed 'rappresentazione sacra', is like the Italian oratorio in text and music, with the following exceptions: it is normally in one section only, its text is restricted to the description or interpretation of the Passion, its performances were restricted to Maundy Thursday and Good Friday and it was performed with scenery, costumes and action. The principal element of the scenery was the holy sepulchre of Christ, which was usually erected in the choir of the court chapel of Eleonora and in the main court chapel, the Hofburgkapelle. (The tradition of erecting sepulchres in the churches of Vienna to commemorate the Passion and death of Christ from Maundy Thursday to Holy Saturday can be documented as early as the beginning of the 15th century.) According to stage directions in extant sources, a curtain opened at the beginning of the performance to reveal the sepulchre, and in the course of the *sepolcro* the members of the cast were required to perform actions appropriate to the circumstances of the drama (e.g. to weep, carry a cross, lift a veil, kneel or bring flowers). For performances of Draghi's *sepolcri* (which appear to be generally characteristic of the 17th-century *sepolcro*) in the chapel of Eleonora, the only scenery was the sepulchre; in the Hofburgkapelle, however, the sepulchre was supplemented by a large backdrop of painted scenery (fig.4). In the early 18th century the tradition of erecting a sepulchre was continued at the Hofburgkapelle, but the works performed at the

4. Drawing by Ludovico Burnacini for his scenic backdrop for Antonio Draghi's sepolcro 'La Passione di Christo', 1694 (A-Wn)

sepulchre were usually oratorios in two sections; at least seven of Caldara's Viennese oratorios are specified to be performed at the sepulchre.

Of special importance for the Italian oratorio in the 18th century are the libretto changes that took place at Vienna in the works of Zeno and Metastasio. As the court poet from 1718 to 1729, Zeno wrote librettos for both operas and oratorios. Among his aims as an oratorio librettist were the restriction of oratorios to subjects found in the Bible, the adherence to the Aristotelian unities of action, time and place, and the creation of spiritual tragedies which would be suitable even as spoken dramas, though intended to be set to music as oratorios. Zeno also opposed the introduction of divine personages in the oratorio. Most of Zeno's 17 oratorio librettos were first set to music by Caldara. Zeno's successor as court poet in 1730, Metastasio, one of the greatest poets of his time, retained many of the changes introduced by his predecessor. Of Metastasio's eight oratorio librettos, seven were written for Vienna; two of these were first set to music by Caldara, three by the elder Reutter, one by Porsile and one by Predieri. Like Zeno, Metastasio preferred biblical subjects, and only one of his Viennese librettos, *Sant'Elena al Calvario* (1731), is non-biblical; Metastasio also sought to adhere to the Aristotelian unities, and he avoided introducing divine personages. But unlike his predecessor, Metastasio clearly made a distinction between the libretto for an oratorio and one for a staged drama; thus his oratorio librettos tend to concentrate on the inner, psychological development of the drama, the external events themselves being outside the poetry, which only refers to them. The appropriateness of Metastasio's oratorio librettos for an unstaged musical genre and their highly polished literary style no doubt account for their being the favoured librettos of composers of Italian oratorios throughout the 18th century.

Until the first decade of the 18th century the musical style of Viennese oratorios remained similar to that of oratorios in Italy, but in the period of Fux and Caldara the style became more elaborate. After 1716, the year of his arrival in Vienna from Rome, where his music had become increasingly *galant*, Caldara considerably modified his style by making it conform more closely to that of Fux, whose music had been favoured at the Viennese court for several years. In the Viennese oratorios of both composers the orchestral accompaniments and independent numbers are more elaborate than was characteristic in Italy; solo vocal lines reveal little of the early Classical element but are typical of the late Baroque period in their long, spun-out phrases; the choruses, while not more numerous, tend to be longer and more contrapuntal.

Vienna was by far the most prominent centre of oratorio cultivation in Roman Catholic, German-speaking areas, but oratorios and oratorio-like works were at times performed elsewhere in Catholic Austria and Germany. Of special importance are the early 17th-century Latin dialogues of Daniel Bollius, active at Mainz. His Latin sacred dramatic work titled *Repraesentatio harmonica conceptionis et nativitatis S Joannis Baptistae ... composita modo pathetico sive recitativo* (?1620) has been called the 'first oratorio in Italian style composed on German soil' (Gottron, 1959).

7. Protestant Germany: Baroque. German composers adopted some of the new techniques of Italian dramatic music in the early 17th century, but they were slow to develop the new genres of opera and oratorio in their own language. Only in the mid-17th century did the German oratorio tentatively begin, and not until the early 18th century did a more or less clearly defined genre identified by the term 'Oratorium', with a German text, begin to be recognized and accepted in German concert life and Lutheran church services. Indeed, in the early 17th century in Germany the terms 'stylus oratorius' and 'actus oratorius' referred to the art of speech; *stylus oratorius* designated an 'oratorical' or recitative style, and an *actus oratorius* was usually a spoken, sacred, school drama, sometimes with music, given by students learning the art of the orator. Even in the 18th century the term 'Oratorium' seems to have been used more freely in Germany than in Italy to designate musical settings of a greater variety of texts. Among the antecedents of the German oratorio are the *historia* (including the Passion with a purely scriptural text), the *actus musicus*, the oratorio Passion, the sacred dramatic dialogue, sacred dramas with music and the sacred opera cultivated at Hamburg in the late 17th century. The Italian oratorio, too, influenced the development of the German oratorio, particularly in the early 18th century.

One of the strongest roots of the German oratorio is the Lutheran *historia*, a musical setting of a scriptural story, intended for performance in church. The Passion was the earliest and by far the most important subject; the Easter and Christmas stories were of secondary importance, and others were rarely used. In the 16th century and early 17th the text of the *historia* was restricted to biblical narrative, except for brief introductory and concluding passages. Among the several types of

musical settings for 16th-century *historiae*, the one most clearly an oratorio antecedent required a responsorial performance and was realistically dramatic in conception: solo chant (a liturgical recitation tone) was used for the Evangelist's narration and the speech of the individuals, while that of two or more was set polyphonically (*see* PASSION). In the early 17th century this type of *historia* sometimes adopted the basso continuo accompaniment and adapted the monodic style in such a manner that the solo vocal lines constituted a compromise between the traditional recitation tone and the new monody, as in the Evangelist's part in Schütz's *Historia der frölichen und siegreichen Aufferstehung unsers einigen Erlösers und Seligmachers Jesu Christi* (Dresden, 1623). Although this work is sometimes called Schütz's 'Easter Oratorio', it is better understood as an antecedent of the oratorio: in the tradition of the Lutheran *historia* but unlike the contemporary oratorio libretto, its text is composed entirely of biblical quotation (except for the introductory and concluding passages). Furthermore, the work is modelled on a 16th-century *historia* by Antonio Scandello, and like the latter shows an unrealistic, non-dramatic approach to the text in that the speech of individuals (Jesus and Mary Magdalene) is set for two voices. (In his prefatory remarks to the work, however, Schütz allowed for a more dramatic performance by suggesting that one of the vocal parts for these roles might be instrumentally performed or even omitted.) Schütz's Passion *historia* on the Seven Words of Christ (*Die Sieben Wortte unsers lieben Erlösers und Seeligmachers Jesu Christi*, ?1645) is much closer to the oratorio in its melodic style, which is free from the influence of chant, and in its realistic approach to the dramatic roles. Indeed, a work in which Schütz arrived at the threshold of the oratorio is his *historia* for Christmas (*Historia der freuden- und gnadenreichen Geburth Gottes und Marien Sohnes, Jesu Christi, unsers einigen Mittlers, Erlösers und Seeligmachers*, Dresden, 1664). Often referred to as the composer's 'Christmas Oratorio', this work has also been called 'the first German oratorio' (Schering, 1911, p.148). The composition merits this claim on the basis of its length, dramatic treatment of roles and musical style in general; yet it is a *historia* in that its text consists entirely of biblical quotation (except for the opening and closing passages) and the Evangelist's recitatives retain suggestions of a liturgical recitation tone.

In the mid-17th century some composers, particularly in Saxony and Thuringia, began to use the term 'actus musicus' for works with some of the same characteristics as those called *historia*. The new term was analogous to *actus oratorius*, mentioned above, already in use. In the second half of the 17th century the *actus musicus* and *historia* were similar in function and general structure. Both were intended to be performed during a Lutheran church service, both characteristically quoted narrative and dialogue passages drawn from a biblical story, and both could include non-biblical interpolations – either stanzas of chorales or freely composed poetry or prose. The *actus musicus* differed from the *historia*, however, in its greater use of non-biblical interpolations and greater emphasis on dramatic elements, such as musical characterization and quasi-theatrical performing practice. The *historia* tended to remain close to the liturgy, as a musical and dramatic elaboration of a scriptural reading, but the *actus musicus* was less liturgical and at times quite close to the oratorio. Andreas Fromm's *Actus musicus de Divite et Lazaro, das ist Musicalische Abbildung der Parabel vom Reichen Manne und Lazaro* (Stettin, 1649) has been called 'the first German oratorio' by Schwartz (1898), with some justification, for its German text is dramatic and non-biblical, as are oratorio librettos, despite the fact that its theme was drawn from *Luke* xvi.19–25. Among the other sacred dramatic compositions of the 17th century that bear the designation 'actus' are Johann Schelle's *Actus musicus auf Weihnachten* (1683), P.H. Erlebach's *Actus pentecostalis* (1690), and four works dating from about 1690–1702: Abraham Petzold's *Actus paschalis* and *Actus* (*in Festo Michaelis*), F.W. Zachow's *Actus pentecostalis* and Kuhnau's *Actus Stephanicus*.

From the mid-17th century composers began to insert music with non-biblical texts into their *historiae*, primarily the Passion *historiae*, a practice which resulted in what may be termed the 'oratorio Passion'. Like the responsorial type of Passion *historia*, the oratorio Passion uses as its basic text the Passion story, either quoted from a single Gospel or 'harmonized' from the four Gospels; soloists sing the roles of the Evangelist and the individual characters, and the chorus sings the parts of the turba. The distinguishing features of the oratorio Passion are the interruption of the Gospel account by contemplative interpolations and the use of modern recitative and concertato styles, as opposed to the plainsong and *a cappella* styles common in the responsorial *historiae*. The interpolations in the earliest oratorio Passions have texts from books of the Bible other than the Gospels or from chorales. In the late 17th century and early 18th, however, the interpolations are increasingly made up of freely composed spiritual poetry, comparable with that found in Italian oratorios. The musical settings of the interpolations vary from the simplest choral and song styles to elaborate imitative and antiphonal choruses and italianate arias.

In its retention of the biblical text and its function as a part of the traditional, established liturgy, the oratorio Passion would seem to lie outside the mainstream of the oratorio's development. Nevertheless, the combination of narrative, dramatic and contemplative elements in its text and the use of an operatic musical style make it a close relative of the oratorio. In fact, in the early 18th century Scheibe actually considered the oratorio Passion as a type of oratorio (*Der critische Musikus*, i, 1738, pp.159–60), but the term 'oratorio' (or the German 'Oratorium') is virtually never found on the title-page of an oratorio Passion in the Baroque era.

The earliest-known oratorio Passion is Thomas Selle's *Passio secundum Joannem cum intermediis* (1643). Oratorio Passions from the second half of the 17th century include Johann Sebastiani's *Das Leyden und Sterben unsers Herrn und Heylandes Jesu Christi nach dem heiligen Matthaeo* (1663; printed Königsberg, 1672), Johann Theile's *Passio nach dem Heiligen Evangelisten Matthäo* (Lübeck, 1673), and an anonymous *Matthäuspassion* dating from between 1667 and 1683, attributed by Birke (1958) to Friedrich Funcke. From about the turn of the century are the St Matthew oratorio Passions by J.G. Kühnhausen and J.V. Meder. Numerous other oratorio Passions of the late 17th century and early 18th are extant, with the passions of J.S. Bach forming the culmination of the development. (For the German Passion oratorio, see below.)

Closely related to the Lutheran *historia*, and important as an oratorio antecedent, is the large corpus of sacred dramatic dialogues which sometimes functioned as motets in the Lutheran liturgy of the 17th century. Some works called dialogues in this period are, in fact, quite brief *historiae*, with strictly biblical texts, solo settings for individuals and either solo or polyphonic settings of narrative passages. Many more, however, differ from the *historia* in their texts by combining fragments from various books of the Bible, omitting the connecting narratives of biblical stories, freely paraphrasing biblical passages, combining biblical with non-biblical material (especially with chorales), or using purely non-biblical material, often with allegorical characters. Most of the 17th-century sacred dramatic dialogues in German are so brief and include so little dramatic development that they can scarcely be considered oratorios by comparison with the works in Italian and Latin that were normally so called in the same period. Among the composers of these brief works, which have been called 'oratorio dialogues' by Schering and others, are Schütz, Schein, Scheidt, Andreas Hammerschmidt, the younger Kaspar Förster, J.E. Kindermann, Johann Rosenmüller, J.R. Ahle, W.C. Briegel, Augustin Pfleger, Matthias Weckmann, Christoph Bernhard and Buxtehude. Among the best examples of such dialogues, and one that has been loosely called an oratorio in musicological literature, is Weckmann's *Dialogo von Tobia undt Raguel: Wo willen wir einkehren* (1665), formerly attributed to Rosenmüller.

Latin dramatic dialogues, although less prominent than those in German, were also composed for the Lutheran liturgy. Of special interest in the mid-17th century are the two extended Latin dramatic dialogues of the younger Förster, *Dialogus de Juditha et Holoferne* and *Dialogi Davidis cum Philisteo*, both of which could equally well be called oratorios; a student of Carissimi in Rome, Förster adopted many elements of his master's oratorio style.

While the function of sacred dramatic dialogues in Germany was normally liturgical, such dialogues were also performed in Hamburg in the concerts of Weckmann's collegium musicum, founded about 1660. Another non-liturgical function of oratorio-like works is found in the performances at the Marienkirche in Lübeck known as ABENDMUSIK. These concerts of sacred music were of special importance for the development of the oratorio from the period of Buxtehude's activity in Lübeck (1668–1707) and throughout the 18th century. Presented during the evenings of the last Sundays of Trinity and the second, third and fourth Sundays of Advent, the Abendmusiken under Buxtehude's direction appear to have consisted either of concerts of miscellaneous vocal and instrumental compositions or performances of large, oratorio-like works. What is known of the music performed at Buxtehude's concerts is limited primarily to the conclusions that may be drawn from four extant librettos printed for use at the Abendmusiken and one subject of a work known to have been performed at one of these concerts. The four extant librettos are *Die Hochzeit des Lammes* (1678), *Abdruck der Texte, welche … bey den gewönlichen Abend-Musicen … praesentiret werden* (1700), *Castrum doloris* (1705) and *Templum honoris* (1705). The work known only by its subject is one which Buxtehude called, in a letter, his 'Abend Music' of the prodigal son, performed in 1688. The first of the librettos is clearly an oratorio, although that term was not yet used for German works, and the last two are closely related to the oratorio. The work on the story of the prodigal son might have been an oratorio. The second-named libretto, *Abdruck der Texte*, however, provides the texts for all five of the Abendmusiken in 1700, and it shows that each of these concerts consisted of a mixture of sacred vocal works, none of which related to the oratorio.

Hamburg was the chief centre for the cultivation of German oratorio in the early 18th century, as it was for German opera. Nevertheless, oratorio was viewed by some as an unwelcome innovation there in the first decade of the century. In 1705 Reinhard Keiser's *Der blutige und sterbende Jesus*, with a text by C.F. Hunold (under the pseudonym of Menantes), met with opposition from the clergy and the city fathers when it was performed in Hamburg Cathedral. The work is a Passion oratorio, i.e. an oratorio with a poetic text, based on the biblical Passion but without biblical quotations. Influenced by the Italian oratorio and the new italianate cantata texts of Erdmann Neumeister, Hunold expressly stated that his new work was like 'the Italian so-called oratorios'. The criticisms of this historically significant work focussed on its theatricality and its omission of the Evangelist's narrative passages. Further controversies about oratorio came in 1705, when the Hamburg organist Georg Bronner met with opposition to his performance of an oratorio at a public concert, and again in 1710 when he was denied the use of a church for an oratorio performance. But oratorios were fully accepted in Hamburg Cathedral from 1715 when Mattheson introduced them there. In fact, his oratorios were intended to take the place of church cantatas in the liturgy of Hamburg Cathedral on important feast days or other special occasions, although they were often subsequently performed in public concerts as well. A direct successor of Hunold's libretto is the Passion oratorio by Brockes, *Der für die Sünden der Welt gemarterte und sterbende Jesus* (1712), which was set to music by numerous composers, including Handel, Keiser, Mattheson and Telemann (the settings by these four composers were performed under Mattheson's direction at Hamburg in Holy Week of 1719).

By the second decade of the 18th century the German oratorio had become a well-established genre in Hamburg and in the Abendmusiken at Lübeck, and it was becoming increasingly popular in other areas of Germany as well. Among the more important composers of German oratorios in the late Baroque style of the first half of the 18th century are Keiser, Mattheson and Telemann, although in the oratorios of Telemann early Classical elements are sometimes prominent. The German oratorios of these composers and others in the first half of the 18th century reflect the styles and forms of the German opera of its time; they differ from contemporary Italian oratorios in that both libretto and music are marked by greater contrast and variety. The librettists were little interested in restricting their works by observing the Aristotelian unities, and their librettos seem less carefully worked out than those of Zeno and Metastasio. The subject matter is usually biblical (the Passion oratorio was more important than in Italy), and allegorical characters are frequently included. Choruses are more prominent than in the Italian oratorio and often have biblical texts; the frequent use of chorales is a distinguishing feature of the German oratorio.

There are many German works from the first half of the 18th century designated as oratorios and distinguishable as examples of the genre, but the term 'Oratorium' seems to have been more frequently applied to borderline cases than in Italy, i.e. to works which combine elements of the related genres of oratorio, sacred cantata, sacred dialogue and/or *historia*. The three works for which Bach used the term 'Oratorium' (*Weihnachts-Oratorium* BWV248, *Oster-Oratorium* BWV249 and *Oratorium auf Himmelfahrt* BWV11) illustrate this terminological freedom in Germany. All three show some relationship to the oratorio, but they are more like church cantatas (or, in the case of the Christmas Oratorio, a series of six cantatas) than oratorios in the normal 18th-century sense. Both the Christmas and Ascension works are also related to the *historia*; the texts of both are largely contemplative, but they include, like the *historia*, narrative quotations from the Bible sung by the 'Evangelist'. The Easter Oratorio is essentially a dialogue among four people; although its duration is more like that of a cantata than an oratorio (it is a parody of a secular cantata, BWV249*a*), in its purely poetic text it is closer to the genre of oratorio than the other two works.

8. HANDEL AND THE ENGLISH ORATORIO. In 17th-century England the dramatic tendencies in music of the early Baroque period were by no means as strong as in Italy; English opera began later in the century, and sacred dramatic music did not develop beyond the brief dialogue. Among the earliest examples of English sacred dialogues are two works by John Hilton (ii), *The Dialogue of King Solomon and the Two Harlots* and *The Dialogue of Job, God, Satan, Job's Wife and the Messengers*, possibly composed as early as 1616. Some dialogues show a relationship to the verse anthem; for instance, an extant text of a verse anthem by Richard Portman, *How many hired servants*, dated 1635, is based on the story of the prodigal son, in which the dialogue takes place in the verses and the narrative passages are given to the chorus. Other composers of the few known sacred dramatic dialogues in English are Henry Blowman, Benjamin Lamb, Nicolas Lanier (ii), Purcell, Robert Ramsey and John Wilson. Purcell's only sacred dramatic dialogue is his setting of *In guilty night*, a text based on the story of Saul and the Witch of Endor, also set by other 17th-century composers. Thus English composers made a tentative beginning with the type of composition that might have led to a fully developed oratorio, perhaps by way of a dramatic verse anthem; they did not carry on this development, however, and when Handel arrived in England he found audiences that were unfamiliar with the form. The English oratorio is Handel's creation, his remarkable synthesis of elements found in the English masque and anthem, the French classical drama, the Italian *opera seria* and *oratorio volgare*, and the German Protestant oratorio. Similar in some respects to oratorio on the Continent, the Handelian variety is often so strikingly different as to appear to be an independent genre.

For Handel in England the word 'oratorio' normally designated a musical entertainment that used a three-act dramatic text based on a sacred subject; the musical setting employed the styles and forms of Italian opera and English sacred choral music, although at times modified in their new context; the chorus was considered essential and was thus usually prominent; and the manner of performance was that of a concert, usually at a theatre or concert hall, often with concertos performed between the acts. The greater use of the chorus and the division into three acts (Handel preferred 'act' rather than 'part' for the sections of an oratorio) are among the features that distinguish the Handelian English oratorio from the Italian oratorio. Among Handel's exceptions to his normal meaning of the word 'oratorio' are its use for *Israel in Egypt*, *Messiah* and the *Occasional Oratorio*, all of which have non-dramatic librettos; another exception is his benefit concert in 1738, announced as 'Mr Handel's Oratorio', a miscellaneous programme with no unifying plan. *The Triumph of Time and Truth* (1757), a revision of an Italian work, might also be considered an exception, since its text is more ethical and moral than religious, even though Act 3 includes an anthem of petition to the Lord and closes with a 'Hallelujah' chorus. Seven works by Handel are sometimes classified as 'secular oratorios': *Acis and Galatea*, *Alexander's Feast*, *Ode for St Cecilia's Day*, *L'Allegro*, *Semele*, *Hercules* and *The Choice of Hercules*. Nevertheless, none of these compositions was originally called an oratorio by its composer; in Handel's England the term 'secular oratorio' was not used and would have seemed self-contradictory. Thus in a genre classification of Handel's works based on the normal terminology used in England in his time, these seven compositions would be excluded from the oratorio category.

The English oratorio came into being quite by accident as an unstaged genre. In 1718 Handel composed *Esther*, a short work that borrows heavily from his Brockes Passion (1716). On the composer's birthday in 1732 the Children of the Chapel Royal, under the direction of their master, Bernard Gates, presented a private, staged performance of *Esther* for the Philharmonic Society at the Crown and Anchor Tavern. Later in the same year Handel intended to present publicly a similar staged version, using the same young performers, at the King's Theatre in the Haymarket, but he was prevented from doing so by the Bishop of London, Edmund Gibson. Bishop Gibson, who was dean of the Chapel Royal, considered the opera house an immoral place, and his objections were apparently to a staged performance there of a work with a sacred subject and to the participation in that performance of the boys of the Chapel Royal. Forced to compromise, Handel accepted for *Esther* the traditional, continental manner of presenting oratorios: the work was performed without staging, in a revised, concert version, by mature professional musicians (fig.5). The success of *Esther* in this form prompted Handel to compose two more oratorios, *Deborah* and *Athalia*, for unstaged performances in 1733, and he retained this manner of performance for his oratorios for the rest of his life. Except for the 1732 performance of *Esther*, there is no precedent from Handel's time for the 20th-century staged performances of his oratorios.

Handel did not compose another oratorio for five years, during which he continued to concentrate primarily on Italian opera. During the period 1738–45, however, he returned to oratorio, composing six works: *Saul*, *Israel in Egypt*, *Messiah*, *Samson*, *Joseph and his Brethren* and *Belshazzar*. Of these, *Messiah* is by far the best known and has been the most influential work since Handel's death in shaping the popular conception of his oratorios; yet it is a setting of a purely biblical, non-dramatic text,

By His MAJESTY's COMMAND.

AT the KING's THEATRE in the HAY-MARKET, on Tuesday the 2d Day of May, will be performed,

The SACRED STORY of ESTHER: AN ORATORIO in ENGLISH.

Formerly composed by Mr. HANDEL, and now revised by him, with several Additions, and to be performed by a great Number of the best Voices and Instruments.

N. B. There will be no Action on the Stage, but the House will be fitted up in a decent Manner, for the Audience. The Musick to be disposed after the Manner of the Coronation Service.

Tickets will be delivered at the Office in the Opera house, at the usual Prices.

5. Announcement of the first performance of Handel's oratorio 'Esther', King's Theatre, Haymarket; cutting from the 'Daily Journal' [London] (19 April 1732)

and as such is not representative of the Handelian oratorio, which is essentially a dramatic genre. In the years 1746–8 Handel composed four oratorios of a militaristic flavour. The *Occasional Oratorio*, first performed in 1746, was an act of encouragement to the ruling Hanoverian regime in its struggle with the invading forces of Prince Charles Edward Stuart, the Young Pretender. After the Hanoverian victory (1746), Handel composed *Judas Maccabaeus*, *Alexander Balus* and *Joshua*; in a sense, these are all 'occasional' oratorios, since they sought favour with a public still in a mood to celebrate conquering heroes. Handel's late period of oratorio composition, 1748–52, includes his *Solomon*, *Susanna*, *Theodora* and *Jephtha*; *Theodora* is reported to have been Handel's favourite.

The Handelian oratorio functioned as an opera substitute, in a sense, since Handel eventually abandoned Italian opera for oratorio but continued to use opera theatres and, at least for a while, opera singers. But it was not an opera substitute for the same reason that the *oratorio volgare* was in such cities as Rome and Venice where opera was not performed during Lent and oratorio took its place. Handel's oratorio seasons often coincided more or less with Lent because of the sacred subject matter of the oratorios, but, during his life, operas continued to be performed during Lent in London, and his oratorios competed with them.

The librettos of Handel's oratorios were received by their audiences as 'unprecedented, unequalled expressions of the religious sublime' (Smith, 1995, p.168). All the librettos but *Messiah* and *Theodora* are based on the Old Testament or the Apocrypha, and even *Messiah* contains more texts from the Old Testament than the New, despite its Christian theme. The Old Testament subject matter, which was considerably modified by the librettists, had a strong appeal to Handel's audiences. Not only were they generally familiar with the stories, but they perceived a parallel between the Israelites and the English of their own time: both were intensely nationalistic and led by heroic figures, and both regarded themselves as being under the special protection of God, who was worshipped with pomp and splendour. The 'just' wars that the Israelites wage against enemies of their faith in Handel's oratorios were well understood by the oratorio audiences, for religion had long been the traditional English justification for war (Smith, 1995, p.242). Handel's librettists were influenced by the contemporary masque, which in this period was a short English opera, but even more so by classical drama. The librettists sought to incorporate into their works much of the spirit and technique of ancient Greek drama, and especially its use of the chorus, which functions at times within the action, and at other times outside it in the role of a commentator.

The most striking feature of Handel's choruses in the oratorios is their stylistic variety. A general classification of the choruses according to styles and procedures results in several types, including choruses with predominantly simple, homophonic texture; massive chordal effects, at times using double-chorus antiphony; predominantly fugal texture, including fugues with one to three subjects; a basso ostinato, usually varied; and a freely imitative texture, in what might be called motet or madrigal style. Nevertheless, it is difficult to find many choruses that are so consistent in their approach that they fit neatly into a single class, for there tends to be considerable variety within a chorus. Striking contrasts of texture, particularly, as well as contrasts of melodic, rhythmic and harmonic procedures within the choruses and large choral complexes are frequent; such contrasts no doubt have much to do with the general popularity of Handel's chorus-dominated *Israel in Egypt* and *Messiah*. Handel seems always to have been acutely aware of the expressive possibilities of the words in his choruses, and his text settings abound in striking effects of word-painting and symbolism. In no other oratorio, however, did he employ as much outright pictorialism as in *Israel in Egypt*.

The arias and ensembles in Handel's oratorios generally resemble those of contemporary Italian opera in the expression of their affections but less so in their structure. The virtually invariable da capo form of Italian *opera seria* and *oratorio volgare* is employed with generally decreasing frequency in Handel's oratorios from *Esther* to *Samson*. There is considerable fluctuation in the proportion of da capo arias after *Samson*, but only in *Susanna* and *Theodora* are there more da capo arias than other types, and these works are both closer in several respects than Handel's other oratorios to the *oratorio volgare*. The other arias tend to be in binary, ABA^1, or, occasionally, in strophic form. Most of the ensembles of the oratorios are duets, although there are a few trios and quartets. Unlike the duets of *opera seria* and *oratorio volgare*, those in Handel's oratorios are rarely in da capo form.

The French overture is the most prominent opening instrumental number of Handel's English oratorios; 11 of his 17 oratorios begin with a French overture, at times somewhat modified. The overtures of *Deborah* and *Judas Maccabaeus* foreshadow material used subsequently in their respective oratorios, the former more clearly than the latter.

Handel borrowed heavily from his own compositions and those of others in his oratorios; such borrowing was common in his time, and his practice differed from that of his contemporaries only in degree. But in only a few instances did Handel include an entire movement, unchanged, from another composer's work; he nearly always used the borrowed material to stimulate his imagination and developed the material in his own way. Handel was recognized in his time as the pre-eminent master of the English oratorio, and very few such works were composed

by others, though there are examples by Maurice Greene, Willem De Fesch, Arne and Stanley.

9. Charpentier and the oratorio in France. Although some of Carissimi's oratorios were known in France by the mid-17th century, French composers of the period appear to have been little interested in sacred dramatic music. The only antecedents of the oratorio comparable with those of 17th-century Italy and Germany are a few dialogue motets by such composers as Guillaume Bouzignac and Henry Du Mont. Marc-Antoine Charpentier, a student of Carissimi in Rome, appears to have been the first French composer of oratorios. By 1672 he had returned from Rome to Paris, and some of his oratorios no doubt date from the 1670s. Charpentier called none of his compositions oratorios, but used such terms as 'historia', 'canticum', 'dialogue' or 'motet'; 34 of his works have Latin dramatic texts though, and clearly relate to the history of the oratorio. Of these, at least 22 may be called oratorios with as much justification as the Latin works of his master, Carissimi, listed above, whose influence they clearly reveal. Like Carissimi's, many of Charpentier's oratorios are relatively brief works in one section only, such as *Le reniement de St Pierre*. The longer ones, such as *Judith sive Bethulia liberata*, *Mors Saülis et Jonathae* and *Judicium Salomonis*, are divided into two, which was more common for oratorios in Charpentier's time. Most of Charpentier's oratorios are based on biblical subjects, although a few are hagiographical. The librettos include narrative passages set for one or more soloists and/or chorus. Of special importance in these oratorios is the chorus, often a double chorus, which is far more prominent than in the Italian oratorio of the same period. The chorus functions not only as a narrator, but also as a turba and a commentator standing outside the action. The precise functions of most of Charpentier's oratorios are not known, but they appear to have been performed as extended motets during festive masses, at concerts in churches (particularly the Jesuit church of St Louis) and during Lent for musical evenings at the residence of Marie de Lorraine, the Duchesse de Guise, whom Charpentier served as *maître de musique*.

Few oratorios appear to have been composed in France during the 50 years following Charpentier's death in 1704. Sébastien de Brossard, in his *Dictionnaire de musique* (Paris, 2/1705), defined 'oratorio', without giving the Italian word a French equivalent, as 'a species of spiritual opera', and he mentioned that one by 'Sieur Lochon has just been presented to the public', no doubt J.-F. Lochon's *Oratorio de nativitate Christi*, published in his *Motets en musique, ... et un oratorio* (Paris, 1701), the only oratorio by a French composer to be published in the 18th century. Other oratorios dating from the first half of the 18th century by French composers are Louis-Nicolas Clérambault's *L'histoire de la femme adultère*, Brossard's *Oratorio sopra l'immaculata conceptione della B. Vergina* (incomplete) and the anonymous *Oratoire St François de Borgia à gd. choeur sur la mort d'Isabelle reine d'Espagne*; the first two are italianate in style, but the last is closer to the style of Lully. The first three have Latin texts; the last is in French.

10. Italian oratorio at home and abroad: early Classical and Classical styles. Early Classical style traits are often present in music of the late Baroque period, as in the Roman oratorios of Caldara, but these traits become particularly prominent in works composed from the 1720s onwards by men such as Vinci, Pergolesi and Leo. This new style, with its emphasis on homophonic texture and symmetrical phrases, among other important elements, has often been referred to as that of the 'Neapolitan school', for some of its best exponents were trained at Naples. Nevertheless, these early Classical traits seem to appear in Venice, Rome and elsewhere as early as in Naples, and the style was favoured by numerous composers associated neither with Naples nor with Italy. This style became increasingly prominent in Italian oratorios from the 1720s on, and in the 1770s the fully developed style of the Classical period emerged. Composers of oratorios other than Vinci, Pergolesi and Leo, who were associated with Naples early in their careers and who composed in the early Classical and Classical styles are Porpora, Jommelli, Piccinni, G.F. Majo, Antonio Sacchini, Cimarosa, P.A. Guglielmi, Paisiello and Zingarelli. Among composers of oratorios whose works were in the early Classical or Classical style but were associated with other Italian centres of oratorio composition are Galuppi and Bertoni in Venice, and G.B. Casali, G.B. Costanzi and Pasquale Anfossi in Rome.

Throughout the period considered here the *oratorio volgare* dominated in Italy; at the Crocifisso, in Rome, where the *oratorio latino* had been fostered since Carissimi's time, oratorio performances ceased after 1710, except for Holy Year 1725, and only at the conservatories in Venice did the *oratorio latino* continue to be used through most of the 18th century. The two-part structure of the Italian oratorio, common in the Baroque period, was retained throughout the 18th century and beyond, and the librettos of Metastasio were among the most popular of this period. The primary emphasis in oratorios continued to be on solo singing, and the chorus was little used. The chief aria form was the da capo, although it became increasingly modified late in the century. Arias emphasizing vocal display, already prominent in late Baroque oratorios, continued to be important throughout the 18th century and well into the 19th.

Of interest in later 18th-century Italy was the occasional presentation of staged performances of oratorios. Such performances eliminated an important distinction between the genres of opera and oratorio, leaving only the sacred subject matter and the two-part structure as the essential distinguishing features of the oratorio. For example, Guglielmi's *Debora e Sisara*, with a libretto by Carlo Sernicola, was first performed in Lent of 1788 with operatic staging (with machines, but without dancing) at the Real Teatro di S Carlo in Naples. In the libretto printed for the performance, the work is sub-titled 'azione sacra per musica', a common label for oratorios of the time; characteristically for an oratorio it is divided into a *prima parte* and *seconda parte* (the word for 'act', common in operas, was not normally used in Italian oratorios), and except for its staging it is like the contemporary oratorio in every respect, including a closing chorus. (There is even biblical documentation, in footnotes, in the printed libretto, as is found in many oratorio librettos of the period.) Staged performances of Italian oratorios appear to have been more common in Naples than elsewhere, but they were occasionally given in other cities of Italy and abroad.

Outside Italy the Italian oratorio continued to play an important role in musical life, particularly in Vienna. The

Viennese court patronage of oratorio was not as significant after the death of Charles VI (1740) as it had previously been, but Giuseppe Bonno and Salieri, among others, continued to compose oratorios for the court. With the founding of the Tonkünstler-Societät (1771), oratorios at Vienna became increasingly a part of public concert life; Haydn's only Italian oratorio, *Il ritorno di Tobia* (1775), was first performed at a concert of this society. The Roman Catholic court at Dresden became one of the most significant centres of Italian oratorio cultivation outside Italy by composers in the early Classical and Classical styles. The most important contributor of oratorios at the Dresden court was the Neapolitan-trained Hasse; others before and after him who composed Italian oratorios for this court are G.A. Ristori, J.D. Zelenka, J.D. Heinichen, Joseph Schuster, Franz Seydelmann and J.G. Naumann. Italian oratorio, like Italian opera, was exported to almost every part of Europe during this period, including England, the Low Countries, Spain, Portugal and Russia.

11. GERMANY: EARLY CLASSICAL AND CLASSICAL STYLES. German oratorios of the first half of the 18th century occasionally exhibit early Classical traits, but these did not predominate until about the middle of the century. In both its libretto and music the German oratorio in the second half of the 18th century, as in earlier times, included a greater variety of types and structures than the Italian oratorio of the same period. The librettos of German oratorios range between two extremes: the predominantly dramatic type (biblical in Protestant Germany; biblical or hagiographical in Roman Catholic areas) and the predominantly contemplative type. (The increasing use of the term 'oratorio' for musical settings of works with predominantly contemplative texts increased the confusion of the meanings of the terms 'Oratorium' and 'Kantate' in German usage of the late 18th century, and these terms were sometimes used synonymously.) German oratorios are divided into as many as five sections, but those with one or two are the most common. The chorus and the chorale are as prominent in German oratorios of this period as in those of the late Baroque period. The German oratorio tends to exhibit a freer intermingling of recitative, arioso and aria styles and a greater emphasis on accompanied recitative than does the Italian oratorio of the same period. Arias in da capo form and those emphasizing vocal display are less prominent than in Italian oratorios, while simple arias, often folklike in quality and reminiscent of Singspiel, are more common. The Lutheran oratorio continued in this period to function in a liturgical context, as a substitute for the cantata, and it also became increasingly popular in public concert life. Telemann performed oratorios in his public concerts at Frankfurt and Hamburg, as did his successor at Hamburg, C.P.E. Bach. At Lübeck the Abendmusiken continued to offer oratorios, and from 1772 the concerts of the Tonkünstler-Societät in Vienna included oratorios in German as well as in Italian.

German oratorios with predominantly dramatic librettos are within the mainstream of oratorio development in general, and they tend to be closer to the Italian oratorio of the period in musical treatment, as well as in text, than are those with contemplative texts. Among the oratorios with dramatic librettos written for Hamburg during this period are Telemann's *Der Tag des Gerichts* (1762; libretto by C.W. Alers) and C.P.E. Bach's *Israeliten in der Wüste* (1769; published in 1775; libretto by D. Schiebeler). An extremely prolific composer of oratorios of this type was J.H. Rolle, music director of the city of Magdeburg and one of the best-known oratorio composers in his time; of his approximately 25 oratorios, two are particularly noteworthy for their flexible musical forms in the service of dramatic continuity: *Lazarus, oder Die Feier der Auferstehung* (Leipzig, 1779) and *Thirza und ihre Söhne* (Leipzig, 1781). Numerous dramatic oratorios were composed for the Abendmusiken at Lübeck, including A.C. Kunzen's *Judith* (1759) and *Absalon* (1761) and J.W.C. von Königslöw's *Joseph* (1784) and *Esther* (1787). German oratorios composed for the court of the Archbishop of Salzburg around the middle of the century were strongly influenced, in both their texts and music, by the Italian oratorios performed in Vienna and at other Roman Catholic courts. J.E. Eberlin's *Augustinus*, for example, is a setting of a German translation of an Italian libretto, *La conversione di Sant'Augustino*, first set by Hasse; a particularly noteworthy dramatic oratorio by Eberlin is the Passion oratorio in one section *Der blutschwitzende Jesus*.

The strongest influence on oratorio texts that are predominantly contemplative was the poetry of Klopstock, particularly his *Messias*. Librettos showing Klopstock's influence are those in *empfindsamer Stil*, which emphasized the lyrical and sentimental expression of feelings evoked by religious events and experiences, as well as by scenes in nature. Many such librettos are purely contemplative, without dialogue; for these the term 'cantata' would seem more appropriate than 'oratorio', although, as pointed out above, the terms were sometimes used synonymously in 18th-century Germany. Some librettos that include narrative or dramatic elements show their affinity to the *empfindsamer Stil* in their emphasis on the emotional reflections of the narrator or individual characters. The central theme of many contemplative oratorios is the Messiah, particularly the events of Christmas, the Passion and Ascension. Most important among the librettists are K.W. Ramler, J.F.W. Zachariä and Herder, and the most famous libretto is Ramler's *Der Tod Jesu*, a purely contemplative text, without dialogue, in one section only. C.H. Graun's setting of *Der Tod Jesu* (1755), one of the best-known German oratorios in its period, was performed almost annually in Berlin on Good Friday until the late 19th century. Others who set this text were Telemann, G.A. Kreusser and J.C.F. Bach. Ramler's Christmas oratorio, *Die Hirten bei der Krippe zu Bethlehem*, was set by J.F. Agricola, Telemann, C.A.F. Westenholz, D.G. Türk, J.F. Reichardt, J.C.F. Rellstab and J.L. Eybler; among those who set Ramler's Ascension oratorio, *Die Auferstehung und Himmelfahrt Jesu*, are Agricola, Telemann, J.G. Krebs, G.J. Vogler, C.P.E. Bach and C.F. Zelter. Zachariä's *Die Tageszeiten*, modelled on James Thomson's *The Seasons* (later used by Haydn), is a poem of religious reflections on nature, best known in its setting by Telemann. Herder's librettos *Die Kindheit Jesu* and *Die Auferweckung des Lazarus* were both set by J.C.F. Bach. Lyrical, sentimental texts, particularly for Passion oratorios, continued to be popular in early 19th-century Germany; F.X. Huber's text for Beethoven's *Christus am Oelberge* (1803) clearly reveals the influence of such texts, even though the work has a strong dramatic element in the dialogue.

The most significant German oratorios of the late Classical period are Joseph Haydn's *Die Schöpfung* ('The

Creation', completed in 1798) and *Die Jahreszeiten* ('The Seasons', completed in 1801), two of the finest compositions of his latest period. *The Creation* is based on a text that Haydn took with him from his second London visit. Originally compiled by Lidley (or Linley) from Milton's *Paradise Lost*, the text was reworked in German for Haydn by van Swieten. Divided into three sections, the libretto is essentially narrative and contemplative; although it includes parts for three individuals, the Archangels Raphael, Gabriel and Uriel, they function as narrators rather than as actual characters in a drama. Two others, Adam and Eve, enter in the third section with essentially lyrical lines. The music of *The Creation* clearly reflects Haydn's acquaintance with Handel's music, and its pictorialism is sometimes comparable with that of *Israel in Egypt*; yet the naive simplicity in the music of *The Creation* distinguishes it from Handel's more rhetorical approach and is among the work's most attractive features. The formal structures are remarkably varied in this oratorio, the free mixtures of solo, soli and choral passages being of special interest; the harmonic freedom of the opening orchestral Representation of Chaos is remarkable for its anticipation of the harmonic practices of the 19th century. *The Seasons*, likewise a setting of a van Swieten reworking of an English text, by James Thomson, is less like an oratorio than *The Creation. The Seasons* is in four sections and is mainly a description of the four seasons; its text is not primarily religious and thus is not within the mainstream of oratorio history. It includes three rural characters, Simon, Hanne and Lucas, and a chorus. The music is often simple, reflecting at times the popular style of Singspiel. During the 19th century both *The Creation* and *The Seasons* became extremely popular as concert pieces on the Continent, in England and in North America.

12. France and elsewhere: early Classical and Classical styles. The history of oratorio in France in the second half of the 18th century divides into two phases, the first from 1758 to the early 1760s and the second from 1774 to 1790; the second phase terminated when events of the French Revolution brought to an end the *concerts spirituels*, the Lenten concert series in Paris at which most French oratorios in this period were performed. The first of these two phases falls within J.-J.C. de Mondonville's directorship of the Concert Spirituel (1755–62); five oratorios are known to have been performed in these concerts between 1758 and 1761: Mondonville's *Les Israëlites à la Montagne d'Horeb* (1758), *Les fureurs de Saül* (1759) and *Les titans* (1761); J.-N.L. de Persuis' *Le passage de la Mer Rouge* (1759); and P.J. Davesne's *La conquête de Jéricho* (1760). The music of these five works has not survived, but printed librettos and comments about them by contemporary observers indicate that they were relatively brief works (of about 25 to 30 minutes) and that they all had French texts. Of these works only Mondonville's *Les titans* is outside the mainstream of oratorio history, since it has a secular text. The term 'oratorio' was not consistently applied to oratorios by French composers or observers in the period, but a variety of terms were used, including 'motet françois', 'poëme françois', 'motet françois en forme d'oratorio', 'oratorio françois' and 'hiérodrame'.

The second phase of the French oratorio, 1774–90, coincides with the period during which the *concerts spirituels* were under the directorship of Pierre Gaviniès, Simon Leduc and Gossec. During this period several oratorios were performed every year at the Concert Spirituel, among them the following (unless otherwise indicated, the dates are those of the first performances; most of these works were performed more than once in the period, and some many times): N.-J. Méreaux's *Samson* (1774), *Esther* (1775) and *La Résurrection* (1780); G.M. Cambini's *Le sacrifice d'Isaac* (1774), *Joad* (1775) and *Samson* (1779); H.-J. Rigel's *La sortie d'Egypte* (1774), *La déstruction de Jéricho* (1778) and *Jephté* (1783); Gossec's *La nativité* (1774) and *L'arche d'alliance devant Jérusalem* (1781); F.-A.D. Philidor's *Carmen saeculare* (first performed in London, 1779, and in Paris the next year); Sacchini's *Esther* (originally in Italian as *Ester*, Rome, 1777, revised in French for Paris, 1786) and Salieri's *Le jugement dernier* (1787). At least 20 other composers, mostly obscure, composed oratorios for the *concerts spirituels* during this period. Nearly all the oratorios performed at these concerts were settings of French sacred texts; a notable exception, however, is Philidor's *Carmen saeculare*, which uses a non-dramatic, classical Latin text by Horace. Such a text places this work outside the mainstream of oratorio history, but it was clearly considered an oratorio by contemporary French commentators.

Of special interest in this period are Le Sueur's four 'mass-oratorios' for the feasts of Christmas, Easter, Pentecost and the Assumption of the Virgin Mary, performed in 1786–7 at the Cathedral of Notre Dame in Paris. These highly original, experimental works were elaborate dramatic and programmatic expansions of the Ordinary of the Mass. For each one Le Sueur published an extensive booklet that described the music and his programmatic interpretation of it. The performing forces included an orchestra, chorus and soloists, and the musical numbers consisted of recitatives, arias, ensembles, and large and small choruses. The music for the mass-oratorios is lost, but the descriptions in the published booklets provide a clear notion of the compositional prcedures. Le Sueur's *Oratorio de Noël*, which survives in published form, is not the same as the mass-oratorio for Christmas, but apparently borrows some of its music.

In England Handel's oratorios were seldom given in their entirety after his death, but performances of the most popular selections from them were common. Of special importance for the provincial cultivation of Handel's oratorios was the Three Choirs Festival, which had begun to present Handel's oratorios during his lifetime and which became virtually a Handel festival in the late 18th century. At this festival and elsewhere, *Messiah* was the favoured oratorio. Handel did not found a 'school' of oratorio composition, and relatively few English oratorios were composed in the post-Handelian 18th century. Among the composers who contributed to the small oratorio production in this period are J.C. Smith, John Stanley, Arne, John Worgan, Charles Avison, Samuel Arnold and Luffman Atterbury.

In North America, the performance of selections from oratorios dates from the 18th century and coincides with the rise of concert life and the establishment of singing societies in the principal cities, particularly Boston, New York, Philadelphia and Charleston. Numbers from Handel's oratorios were occasionally performed, particularly from *Messiah*. It is not known when the first complete oratorio performance in America took place, but Samuel

Felsted's oratorio *Jonah* (printed in London, 1775) was performed in New York in 1788 and in Boston in 1789. In 18th- and 19th-century America the word 'oratorio' was applied not only to the genre but also to virtually any concert of sacred music. (The latter use of the term is similar to Handel's exceptional use of it for a concert of his music in 1738.) For instance, in the public announcement of the programme in which Felsted's *Jonah* was to appear at Boston in 1789, the concert itself was called 'an Oratorio, or, Concert of Sacred Musick', and the second half of the programme consisted of 'The oratorio of *Jonah*, complete'. 'Oratorios' in the concert sense were presented either in public concert halls in a secular context or in churches in a context that sometimes included prayers and biblical readings.

The influence of the Italian oratorio in countries to which it was exported in the 18th century resulted, at times, in the composition of italianate oratorios by native composers in their own language. Spanish oratorios of this type, for example, were composed in 18th-century Barcelona by the successive directors of music of Barcelona Cathedral, Francisco Valls, José Pujol, José Durán and Francisco Queralt. Danish composers who wrote oratorios in their native language are P.M. Lem, H.O.C. Zinck and J.E. Hartmann.

13. Germany, Scandinavia and eastern Europe: 19th century. A new tendency in German oratorio librettos of the 19th century is that of literary Romanticism: supernatural, mysterious, fantastic and apocalyptic scenes, themes of death and doubt, and those based on religious legends from the distant past are prominent. Oratorios with apocalyptic librettos, including passages from both the Old and New Testament, are Eybler's *Die vier letzten Dinge* (text by Joseph Sonnleithner; 1810), Spohr's *Die letzten Dinge* (text by Friedrich Rochlitz; 1827) and Friedrich Schneider's *Das Weltgericht* (text by August Apel; 1819). Among the numerous works based on legends are Maximilian Stadler's *Die Befreyung von Jerusalem* (1813) and Schneider's *Das befreite Jerusalem* (1835) (both with texts based on Tasso's *Gerusalemme liberata*); Carl Loewe's *Die Zerstörung Jerusalems* (1829), *Die sieben Schläfer* (1833), *Gutenberg* (1836), *Palestrina* (1841) and *Johann Hus* (1842) and Liszt's *Die Legende von der heiligen Elisabeth* (1862).

Oratorio subjects that had long been traditional in Germany, particularly those using biblical stories, continued to be popular in the 19th century. The increasing interest in the oratorios of Handel in the first half of the 19th century contributed to the popularity of biblical oratorios, particularly those based on Old Testament stories. Bernhard Klein's biblical oratorios, *Hiob* (1822), *Jephta* (1828) and *David* (1830), reveal this traditional tendency, as do Schubert's *Lazarus, oder Die Feier der Auferstehung* D689 (1820, incomplete), Schneider's *Pharao* (1828), *Gideon* (1829) and *Absalon* (1831), A.B. Marx's *Mose* (1841) and, late in the century, Bruch's *Moses* (1895). Mendelssohn's *Paulus* ('St Paul', 1836) and *Elijah* ('Elias', 1846), both based on scriptural texts, also represent the traditional tendency in librettos; both were extremely popular works in their time, and *Elijah*, first performed in Birmingham, has retained its popularity to the present day in both English- and German-speaking areas. The Romantic period has also continued to favour oratorios on the theme of the Messiah, as the later 18th century had done; among the numerous Romantic oratorios on this theme are Schneider's *Höllenfahrt des Messias* (1810), Loewe's *Festzeiten* (1825–36) and Liszt's *Christus* (in Latin, with biblical and liturgical texts; 1862–7).

The oratorio continued to be conceived primarily as a sacred genre in the 19th century, but the term itself was exceptionally applied to a purely secular work, such as Bruch's *Arminius: Oratorium* (1877); three other secular oratorios by Bruch, although not identified as oratorios in their titles, are his *Odysseus* (1872), *Achilleus* (1885) and *Gustav Adolf* (1898). Schumann's *Das Paradies und die Peri* (1843–5) and *Der Rose Pilgerfahrt* (1851), neither of which was called an oratorio by the composer, are closely related to the genre and are sometimes classified as secular oratorios. 'Staged oratorios', or sacred operas, continued to be exceptional in the 19th century; Anton Rubinstein's sacred operas, *Sulamith* (1883), *Die Maccabäer* (1872–4), *Moses* (1887–9) and *Christus* (1893), are close to the oratorio in conception, despite their composer's intention that they be staged.

The music of the 19th-century German oratorio, like the libretto, reveals a mixture of traditional and new procedures. Traditional for Germany is the use of the chorale and the emphasis on the chorus, but the performing forces tended to be far greater than in the 18th century. With the growing emphasis on performances of oratorios at music festivals in 19th-century Germany and the period's penchant for massive performances, the composer with a festival performance in mind could expect several hundred voices in his chorus. The aspects of German musical Romanticism that are new in the oratorio of the period are essentially those of German musical Romanticism in general, and particularly of Romantic opera: the large, colourful orchestra, new harmonic and melodic styles and new approaches to motivic and structural unification. Programmatic orchestral preludes and interludes became increasingly prominent, as did 'reminiscence' motifs, phrases or sections, used much in the manner of the operatic reminiscence motif and leitmotif. Prominent among the oratorios of the first half of the century that point the way to the newer musical procedures are those of Schneider, particularly his *Weltgericht*; especially important in the second half of the century for their full development of the new techniques are Liszt's oratorios, mentioned above, and Raff's *Welt-Ende, Gericht, Neue Welt* (1879–81).

Scandinavia and eastern Europe remained heavily dependent upon other areas in the 19th century, particularly Germany, for the oratorios performed in their concerts. The following are among the few composers in Scandinavia of oratorios using the national languages: in Sweden, J.C.F. Haeffner, Pehr Frigel and Gunnar Wennerberg; in Norway, Johannes Haarklou and Catharinius Elling; and in Denmark, Hans Matthison-Hansen. The Czech Dvořák is of particular importance for his oratorio *St Ludmilla* (1886), composed for the Leeds Festival in England. The earliest oratorio known to have been composed in 19th-century Russia is S.A. Degtyaryov's *Minin i Pozharsky, ili Osvobozhdeniye Moskvï* ('Minin and Pozharsky, or The Liberation of Moscow'; 1811). Based on a patriotic libretto by N.D. Gorchakov, with a strong religious element, the monumental setting has a colourful mixture of Western and Russian musical elements. The large orchestra includes a Russian horn

band, a large percussion section and a battalion of cannons.

14. France and the Low Countries: 19th century. The oratorio in 19th-century France was little influenced by that of other areas. Oratorios were performed in public concert halls throughout the century, but they were also given in churches. Le Sueur's *Deborah* (1828), for example, is in Latin and was intended to be performed at Mass; it incorporates the liturgical element of unison psalmodic recitation. But most oratorios of 19th-century France are in French and were intended for the concert hall. They are thus closer to the mainstream of oratorio history than those of Le Sueur; yet a Roman Catholic mystical and quasi-liturgical current runs through most of the oratorio production of France and tends to distinguish French oratorios from those of other nations. Representative of French Romantic oratorios from around the middle to the end of the 19th century are those of Ferdinand David (*Moïse au Sinaï*, 1846; *Le jugement dernier*, c1849), Antoine Elwart (*Noë ou Le déluge universel*, 1845), Berlioz (*L'enfance du Christ*, 1854), Franck (*Ruth*, 1843–6; *La tour de Babel*, 1865; *Rédemption*, 1871–4; *Les béatitudes*, 1869–79; *Rébecca*, 1881), Saint-Saëns (*Moïse sauvé des eaux*, c1851; *Oratorio de Noël*, 1858; *Le déluge*, 1875), Gounod (*Tobie*, 1865; *Mors et vita*, ?1885; *La rédemption*, ?1882), Massenet (*Marie-Magdeleine*, 1873; *Eve*, 1875; *La Vierge*, 1880; *La terre promise*, 1900) and Dubois (*Les sept paroles du Christ*, 1867; *Le paradis perdu*, 1879; *Notre-Dame de la mer*, 1897; *Le baptême de Clovis*, 1899).

Few composers in the Low Countries wrote oratorios before the mid-19th century. The Belgian Peter Benoit is important in the second half of the century for his *Lucifer* (1865), *De schelde* (1868), *De oorlog* (1873) and *De Rhijn* (1889). Other Belgian oratorio composers in this period are Gustave Huberti (*Een laatste zonnestraal*, 1874, and *Verlichting*, 1884) and Edgar Tinel (*Franciscus*, 1886–8). Among the oratorio composers in 19th-century Holland are Anton Berlijn (*Moses auf Nebo*, 1843) and Richard Hol (*David*, 1879).

15. England and America: 19th century. The history of oratorio in 19th-century England is inseparable from that of the provincial music festivals, which were the chief institutions to cultivate oratorio composition and performance. Of particular importance is the Three Choirs Festival, which continued in the early 19th century to emphasize Handel's works. The festivals of Birmingham and Leeds were also of special importance for the history of the oratorio. In the first half of the 19th century selections from and at times complete performances of the oratorios of foreign composers began to appear on English programmes. Among the more popular works of foreign composers were Haydn's *Creation*; Spohr's *Calvary* (i.e. *Des Heilands letzte Stunden*, first performed in London, 1837) and *The Fall of Babylon* (composed for the Norwich Festival of 1842); and Mendelssohn's *St Paul* (performed at Liverpool in 1836, for the first time in England, and conducted by the composer at the Birmingham Festival of 1837) and *Elijah* (first performed at the Birmingham Festival of 1846, where it was conducted by the composer). Foreign oratorios continued to be performed in the second half of the 19th century in England, including those of Saint-Saëns, Gounod, Liszt, Raff, Franck and Dvořák.

In early 19th-century England the stylistic and structural models for new oratorios were mainly the music of Handel, Mozart and Haydn. An outstanding oratorio from this period is Crotch's *Palestine* (1805–11); basically Handelian, it nevertheless includes music that departs significantly from the model and is remarkably modern. Clarke-Whitfeld's oratorio pair *Crucifixion* and *Resurrection* (1822, 1825) are musically among the better Handelian works of the time. From the late 1840s to the 1880s, the primary model was Mendelssohn, who had incorporated elements of Handel's and Bach's choral style into his own work. English oratorios of this period tend to include chorales (absent from English oratorios before *St Paul* and *Elijah*), Mendelssohnian lyricism, reminiscence motifs (or 'representative motifs', as they came to be called in England), greater structural flexibility than before and programmatic overtures. Representative of the period are Ouseley's *St Polycarp* (1855), Costa's *Eli* (1855) and *Naaman* (1864), Bennett's *Woman of Samaria* (1867) and Macfarren's *St John the Baptist* (1872). The late period, beginning in the 1880s, was the most innovatory one for English oratorio: the models of Handel and Mendelssohn tended to be abandoned, and oratorio composers struck out in directions new for England. Wagnerian principles were increasingly adopted – or at least adapted to a composer's personal style. English oratorios became more dramatic, included more long, continuous scenes, and used more reminiscence motifs and occasionally even leitmotifs. The orchestra, increasingly liberated from its purely accompanimental role, became a more significant vehicle of expression. The fugue lost ground as an essential ingredient. Two works from the beginning of the late period are Mackenzie's *Rose of Sharon* (1884) and Cowen's *Ruth* (1887), both important representatives of the 'dramatic oratorio', which was new in 19th-century England. Among the most important works that represent the late style are Stanford's *Three Holy Children* (1885) and *Eden* (1891), and Parry's *Judith, or The Regeneration of Manasseh* (1888), *Job* (1892) and *King Saul* (1894). The Victorian period reached its peak, however, with Elgar's *The Dream of Gerontius* (1900) (discussed below).

The earliest oratorios known to have been composed in America, *Jerusalem in Affliction* (1828) and *The Daughters of Zion* (1829), are by Filippo Trajetta (son of Tommaso Traetta), who established the American Conservatorio in Philadelphia, where his oratorios were performed. In 1841 A.P. Heinrich, among the most significant American composers of the mid-19th century, wrote *The Jubilee: a Grand National Sinfonia Canonicate: Commemoration of the Landing on the Banks of Plymouth by the Pilgrim Fathers*, later called *The Wild Wood Spirits' Chant, a Grand National Song of Triumph; or, The Oratorio of the Pilgrims*. It is a bold, fresh, imaginative and highly creative oratorio, but Heinrich was insufficiently skilled in the craft of musical composition to do justice to his concept. This monumental work was presumably never performed in its entirety. The earliest known oratorio by an American-born composer is *Jephtha* (1845) by J.H. Hewitt, a rather modest work with essentially the same turns of melody, simple harmony and unadorned patterns of accompaniment that Hill had already established in his extremely popular parlour songs and was soon to apply in his operettas. More comparable with European oratorios, however, are

George F. Bristow's *Daniel* (1866), John Knowles Paine's *St Peter* (1870–72), Leopold Damrosch's *Ruth and Naomi* (1874), and Horatio Parker's *Hora novissima* (completed 1892, first performed 1893) and *The Legend of St Christopher* (1898). *Hora novissima* is the only 19th-century American oratorio that is still performed. Unique for its subject matter is Dudley Buck's *The Light of Asia* (1886), based on Sir Edwin Arnold's blank-verse epic of the same name that treats the life of Gautama Buddha, the founder of Buddhism.

16. ITALY AND SPAIN: 19TH CENTURY. The 19th century was a period of decline for the Italian oratorio. The traditional genre lingered on, with little vigour and with conservative *opera seria* characteristics, while the 'staged oratorio', or sacred opera, became increasingly popular. Among the most frequently performed sacred operas was Rossini's *Mosè in Egitto*, a three-act work called an 'azione tragico-sacra' in its earliest version, first performed during Lent of 1818 at the Teatro S Carlo in Naples. Among the unstaged oratorios in 19th-century Italy are Simon Mayr's *Samuele* (1821); Paolo Bonfichi's *Il Genesi* (1826); Mercadante's *Le sette ultime parole di Nostro Signore* (1841); Teodulo Mabellini's *Eudossia e Paolo, o I martiri* (1845); Pietro Raimondi's trilogy *Giuseppe* (1847–8), curiously experimental in that its three constituent oratorios (*Putifar*, *Giuseppe* and *Giacobbe*) are intended to be performed either successively or simultaneously; Giovanni Pacini's *Il trionfo di Giuditta* (1854); Paolo Serrao's *Gli Ortonesi in Scio* (1858); and Jacopo Tomadini's *La risurrezione del Cristo* (1864).

The relatively few oratorios of 19th-century Spain appear to follow the conservative course of those in Italy, although sacred opera seems to have been less popular in Spain. Examples of the Spanish oratorio are Francisco Andreví y Castellar's *La dulzura de la virtud* (before 1819) and *El juicio universal* (1822), Ruperto Chapí's *Los ángeles* (1873) and Tomás Bretón's *El apocalipsis* (1882).

17. THE 20TH CENTURY. New directions were taken in oratorio composition around the turn of the century in both Italy and England. Lorenzo Perosi rejected the *oratorio volgare* of the 18th and 19th centuries, with its heavy dependence on opera, and in his 12 oratorios (among them *La risurrezione di Cristo*, 1898; *La risurrezione di Lazzaro*, 1898; *Il natale del Redentore*, 1899; *La strage degli innocenti*, 1900; and *Il giudizio universale*, 1904) he consciously returned to the format of the Carissimi period, although his scale was larger and his materials were post-Wagnerian. Most of Perosi's oratorios are in two sections and have Latin texts, including a *storico*, or narration, which, in the manner of Carissimi, is distributed among various vocal parts. His aim was to achieve a more serious religious expression than had been characteristic of Italian oratorio in the previous two centuries; to this end he made use of Gregorian chant and adopted a quasi-liturgical attitude, particularly in the numerous choruses. The oratorios of the Franciscan priest Pater Hartmann (Paul Eugen Josef von An der Lan-Hochbrunn) continue in the direction established by Perosi. Of South Tyrolean origin, Hartmann was active mostly in Rome. His five oratorios (*S Petrus*, 1900; *S Franciscus*, 1901; *La cena del Signore*, 1904; *La morte del Signore*, 1906; and *Septem ultima verba Christi*, 1908) set Latin texts in a post-Wagnerian harmonic style. Other 20th-century Italian oratorios include Wolf-Ferrari's *Talitha Kumi* (1900), Malipiero's *S Francesco d'Assisi* (1921), Licino Refice's *Trittico francescano* (1926), Franco Vittadini's *L'agonia del Redentore* (1933), Antonio Veretti's *Il figliuol prodigo* (1942) and Luigi Dallapiccola's *Job* (1950).

In England, Elgar's *Dream of Gerontius* was not only the most important oratorio of the Victorian period but the most creative English oratorio since Handel. Based on Cardinal Newman's poem of the same name, *Gerontius* is the only oratorio by a Victorian composer to have retained a position in the performing repertory up to the present day. The work is organized in two large parts, and the music is continuous throughout each. *Gerontius* owes far more to Wagner's chromatic harmonic language, solo vocal style, motivic technique and orchestral-vocal synthesis than any English oratorio before it. With *Gerontius* the English oratorio achieved the emancipation of the orchestra from its accompanimental role. Elgar's oratorio pair *The Apostles* (1903) and *The Kingdom* (1906) are more conventional for their biblical texts but at the same time unconventional for their continuity and structural flexibility, which continues the harmonic, melodic and orchestral style of *Gerontius*. Like *Gerontius*, they are full of reminiscence motifs, many of which appear in both works. Other important English oratorios are Vaughan Williams's *Sancta civitas* (1925), Walton's *Belshazzar's Feast* (1931), Berkeley's *Jonah* (1935), Fricker's *The Vision of Judgement* (1957–8), Milner's *The Water and the Fire* (1961), and Tippett's *A Child of our Time* (1939–41) and *The Mask of Time* (1980–82). Paul McCartney's *Liverpool Oratorio* (1991) reflects his background in popular music.

American oratorios in the 20th century reveal a wide variety of musical styles, and most rely on traditional subjects for their librettos. Among them are Charles Sanford Skilton's *The Guardian Angel* (1925), Robert Nathaniel Dett's *The Ordering of Moses* (1937), Stefan Wolpe's *Israel and his Land* (1939), Bernard Rogers's *The Passion* (1942), Franz Waxman's *Joshua* (1959), Vincent Persichetti's *The Creation* (1969), Dominick Argento's *Jonah and the Whale* (1973) and Charles Wuorinen's *The Celestial Sphere* (1980).

Among the German-language oratorios, of special interest is Schoenberg's *Die Jakobsleiter* (1917–22), a religious work only in the sense that it is concerned with ultimate human strivings. Despite its imagery of Swedenborgian mysticism, its philosophy is intensely individual, and individualistic: in the first part of the work (the second remained uncomposed, though Schoenberg's text is complete) various easy options to the struggles of living for truth are caustically dismissed. *Die Jakobsleiter*, unperformed until 1958, had no effect on the course of the 20th-century German oratorio, which is better represented by Franz Schmidt's *Das Buch mit sieben Siegeln* (1935–7) on texts from the Apocalypse. Other examples are Hindemith's *Das Unaufhörliche* (1931), Blacher's *Der Grossinquisitor* (1942), David's *Ezzolied* (1957) and the 'folk oratorios' of Joseph Haas (*Die heilige Elizabeth*, 1931; *Christnacht*, 1932; *Lebensbuch Gottes*, 1934; *Lied von der Mutter*, 1939; and *Das Jahr im Lied*, 1952).

The interest in sacred composition on Baroque models that grew in Germany between the wars produced few oratorios, but in Switzerland the fruits were more plentiful

and included Willy Burkhard's *Das Gesicht Jesajas* (1933–5) and Conrad Beck's *Oratorium nach Sprüchen des Angelus Silesius* (1934). Both apply a severe neo-Baroque technique, and Burkhard's piece achieves great force through its stark simplicity. Though not Swiss in origin, Wladimir Vogel took a Swiss subject for his most ambitious work, the oratorio *Thyl Claes, fils de Kolldrager* (1938–45); it is in two parts, each lasting a whole evening, and employs his characteristic polyphonic choral speaking. More impressive among the Swiss oratorios, however, are those of Martin: *Le vin herbé* (1938–41), *In terra pax* (1944), *Golgotha* (1945–8) and *Le mystère de la nativité* (1957–9). The first is an extended work based on the Tristan legend, but its scoring is for only 12 voices and eight instruments. *Golgotha* uses more conventional forces in a quite original form: the Gospel narrative is unfolded in seven 'pictures' separated by settings of contemplative texts by St Augustine. *Le mystère de la nativité* is a 'scenic oratorio' available for stage or concert performance, and in this it looks back to Honegger's *Le roi David*, composed in 1921 as a 'dramatic psalm' for the theatre and revised as an oratorio in 1923. The clearcut facture of this piece, the strong design of individual scenes and the lapidary use of melody and rhythm make it one of the most powerful oratorios of the 20th century. Honegger extended those techniques in *Jeanne d'Arc au bûcher* (1935), which was written as a stage spectacle for Ida Rubinstein, though it may also be given as an oratorio.

Similarly, Debussy's *Le martyre de St Sébastien* (1911), another Rubinstein commission, has often been given in concert performance with the spoken dialogue cut, but the reduction of this five-act 'mystery' to a one-hour oratorio is not entirely satisfactory. The fusion of genres was best achieved by Stravinsky in his 'opera-oratorio' *Oedipus rex* (1926–7). Although the subject is secular, Stravinsky's treatment is liturgical in style, with the text sung in Latin, an important part for the chorus, and the principal actors appearing masked and stationary; the stylization and distance of the presentation are further accentuated by the vernacular commentaries given by a narrator in modern evening dress. If *Oedipus rex* is best regarded as an oratorio for the stage, concert performances can present the neo-classical monumentality of the music, which still leaves room for Verdian effusions.

Stravinsky's oratorio represents a continuation of the genre's secularization, which began in the 19th century. Politically motivated secularization enabled the oratorio to enjoy a vigorous life in Russia, where oratorios had been rare. The oratorio became a medium for the expression of heroic and at times bombastic patriotic sentiments, as in Kabalevsky's *The Great Homeland* (1941–2), Myaskovsky's *Kirov is with us* (1942) and Shaporin's *Story of the Battle for the Russian Land* (1943–4). After World War II the demands of socialist realism produced, throughout eastern Europe, a huge number of oratorios in praise of party leaders or the proletariat. But the period also saw the composition of a few important works: Shostakovich's *Song of the Forest* (1949), Prokofiev's *On Guard for Peace* (1950), Sviridov's *Poem in Memory of Sergei Yesenin* (1955–6) and *Pathetic Oratorio* (1959), and Shnitke's *Nagasaki* (1958).

Elsewhere, new departures in the oratorio continued after World War II. Messiaen's *La transfiguration* (1969) almost dispenses with narrative and with solo voices for an immense, meditative theological exposition drawing on texts from the Bible, the Roman liturgy and Aquinas, and on musical materials characteristic of all periods in the composer's career. Notable among the oratorios of younger composers are Penderecki's *Dies irae* (1967) and Henze's *Das Floss der 'Medusa'* (1968), an 'oratorio volgare e militare' to a politically revolutionary text. Yet perhaps the most far-reaching innovation was made by Krenek in *Spiritus intelligentiae sanctus* (1955), a Pentecost oratorio realized on magnetic tape.

HOWARD E. SMITHER

Orazio. *See* FAÀ DI BRUNO, GIOVANNI MATTEO.

Orazio della Viola. *See* BASSANI, ORAZIO.

Orb. British studio collective. It redefined ambient music and spawned the ambient house genre. It was founded in 1989 by Alex Paterson (Duncan Robert Alex Paterson) and Jimmy Cauty (*see also* KLF). Their first records together, including *A Huge Ever-Growing Brain that Rules from the Centre of the Ultraworld* (WAU, 1989), blended ambient washes with intermittent dance beats, vocal and environmental samples, and became classics of the rave clubs' chill-out rooms. Their first and best album, *Adventures Beyond the Ultraworld* (Big Life, 1991) appeared with an array of remixes of artists as diverse as Laibach, Gary Numan and one of Paterson's influences, Pink Floyd. Cauty was replaced by Kris 'Thrash' Weston, Paterson's studio engineer before the massive commercial success of *UFOrb* (Big Life, 1992) and *The Blue Room*, which at 39 minutes was the longest single to have been released in the UK. After the live compilation *Live '93* (Isl., 1993) Paterson was joined by Thomas Fehlmann, a pioneer of Berlin's early 1990s 'teutonic beats' scene. *Orbvs Terrarvm* (Isl., 1995) disappointed early fans but enhanced the band's commercial appeal. The Orb have picked up many fans from the progressive rock scene, including Gong's Steve Hillage (whose 1990s releases as System 7 included much collaboration with the Orb) and King Crimson's Robert Fripp, who joined the band to create an off-shoot album released as *FFWD* (1994).

IAN PEEL

Orbán, György (*b* Tirgu Mureş, 12 July 1947). Hungarian composer of Romanian birth. He studied composition with Toduţă and Eisikovits and music theory with Jagamas at the Cluj-Napoca Academy of Music (1968–73), remaining there to teach music theory and counterpoint (1973–9). After moving to Hungary, he worked as a music editor for Editio Musica Budapest (1979–90), and became professor of music theory and composition at the Liszt Academy of Music in 1982. Orbán was awarded the Bartók-Pásztory Prize in 1991. His early style, tending towards Western avant-garde techniques, culminated in the Triple Sextet (1979), a recommended work at the Tribune Internationale des Compositeurs in Paris in 1989. In the mid-1980s he turned to a neo-romantic style, and has continued to use formally classical models in his instrumental works. Belonging to the Hungarian choral tradition, his church music, intended partly for liturgical use, displays influences such as jazz, while grotesque and humorous characters enliven his many choruses and songs. In the series of Duos (1979–89) he sets traditional texts with an air of nostalgia for rural life.

WORKS
(*selective list*)

Masses: no.1, solo vv, chorus, ens, 1990; no.2, solo vv, chorus, orch, 1990; no.3, solo vv, chorus, org, 1990–94; no.4, solo vv, chorus, orch, 1991; no.5, solo vv, chorus, cl, vc, db, 1991; no.6, solo vv, chorus, orch, 1991; no.7, solo vv, chorus, 1993; no.8, solo vv, chorus, brass, perc, kbd, 1995; Missa sacri monti Pannoniae, solo vv, chorus, orch, 1995
Other choral: Motet, vv, ob, 1979; Kóruskönyv [Chorus Book] (A. József, D. Szilágyi, J. Pilinszky), I–II, 1983–7; Második kóruskönyv [Second Chorus Book] (József, Szilágyi), 1985; Medáliák könyve [Book of Lockets] (Jószef and others), 1987; Regina martyrum (orat), solo vv, chorus, orch, 1993; Rorate caeli (orat), solo vv, chorus, orch, 1993; Passion (orat), solo vv, chorus, org, perc, str, 1997; Christmas Orat, solo vv, chorus, org, perc, str, 1998; mixed and single-voice choruses on Lat. and Hung. texts
Solo vocal: 5 Canons (József), S, ens, 1977; Duos (trad. text): no.1, S, cl, 1979, no.2, S, db, 1986, no.3, S, vc, 1988, no.4, S, vn, 1989; songs, 1v, pf
Orch: Serenade no.1, 1984; Serenade no.2, 1985; Veronai vázlatok [Sketches from Verona], 1998
Chbr: Triple Sextet, 1979; Wind Qnt, 1985; Sonata concertante, cl, pf, 1986; Sonata, bn, pf, 1987; Sonata no.1, vn, pf, 1988; Sonata no.2, vn, pf, 1989; Trio, vn, va/vc, pf, 1992–3; Str Qt no.1, 1994; Str Qt no.2, 1994; Sonata no.3, vn, pf, 1995; Sonata, va, pf, 1997; Bálzene Razumovszkij grófnak [Ball Music for Count Razumovsky], str qt, 1998; Str Qt no.3, 1998
Solo inst: Hymn, cimb, 1980; Pf Sonata no.1, 1985; Pf Sonata no.2, 1987; Pf Suite no.1, 1987; Pf Sonata no.3, 1988; Pf Sonata no.4, 1989; Pf Suite no.2, 1997; Pf Suite no.3, 1998

PÉTER HALÁSZ

Orbino, Il. *See* CARISIO, GIOVANNI.

Orbison, Roy (Kelton) (*b* Vernon, TX, 23 April 1936; *d* Hendersonville, TN, 6 Dec 1988). American singer-songwriter. The son of an oil driller, Orbison formed his first group, the Wink Westerners, at 13. While studying geology at North Texas College, he watched classmate Pat Boone attain chart success and, with a new rockabilly group, the Teen Kings, Orbison auditioned first for Buddy Holly's producer Norman Petty and, at the suggestion of Johnny Cash, for Sam Phillips at Memphis' Sun Records, with whom he signed in 1956. A recording of *Oooby Dooby*, co-written with two college friends, became a minor hit in 1956. After a couple of years spent recording and touring, Orbison moved to Nashville to concentrate on writing and bought out his Sun contract in 1958. He subsequently signed with Monument: his first record for the label was *Paperboy*; this was soon followed by *Up Town* (1959), which was a modest success. His next record however, *Only the Lonely* (1960), established him in both the USA and Britain. Like many of his hit records to follow, it combined introspection with drama and was a skilful and sophisticated marriage of black and white musics that was in stark contrast to prevailing trends.

Loneliness, despair, guilt and fear were to become recurring themes in Orbison's songs, and the tension of his romantic vignettes was often built to a heart-stopping falsetto climax: only in the last seconds of *Running Scared* (1962), for example, does the singer triumph over his rival.

A major influence on The Beatles, by 1963 Orbison was nevertheless eclipsed by the rise of beat groups. The late 1960s and 70s were marked by personal tragedy and ill-health, and it was not until 1986 that his career was given new impetus when his song *In Dreams* featured prominently in the film *Blue Velvet*. A duet version of his 1961 hit *Cryin*, rerecorded with k d lang, and used in the film *Hiding Out* (1988), was also a chart success. With George Harrison and Bob Dylan, among others, he recorded as the Traveling Wilburys, while his album *Mystery Girl* (Virgin, 1988) was a posthumous hit.

His melding of country music's *Sturm und Drang* with pop's beat, delivered in a quasi-operatic voice, was compelling, and his ballads, often melodramatic, brought maturity to a genre preoccupied with the adolescent angst.

LIZ THOMSON

Orbón (de Soto), Julián (*b* Avilés, 7 Aug 1925; *d* Miami Beach, 20 May 1991). Cuban composer of Spanish birth. He studied at the Conservatory of Oviedo (1935) and then moved to Havana, where he began composing at an early age and had lessons from José Ardévol. From 1942 to 1949 he was a member of the Grupo de Renovación Musical, and he was active as a music critic, essayist and pianist at concerts of contemporary Cuban music. In 1946 he studied with Copland at Tanglewood. During the 1940s and 1950s he was closely associated with the literary group Orígenes, and wrote several essays for their review. He was director of the Orbón Conservatory, Havana (1946–60), founded by his father Benjamín, and taught composition at the National Conservatory in Mexico City (1960–63). In 1964 he settled in New York; he taught at Lenox College, Washington University, St Louis, Barnard College and the Hispanic Institute of Columbia University. He received two Guggenheim fellowships (1959, 1969) and an award from the American Academy of Arts and Letters (1967). His Spanish-Cuban music has been influenced by a wide range of musical and literary interests, including Catholic liturgy, Gregorian chant, the music of Falla and the Halffters, and contemporary poetry; moreover, his close friendships with Chávez and Villa-Lobos have had their effect. Whether in the formal neo-classicism of his early works or the more expansive, vigorous and romantic traits of his later style, his music has always been marked by strict structural design. Occasionally he used 'white' Cuban and Afro-Cuban rhythms, as in *Pregón* and the *Danzas sinfónicas*.

AURELIO DE LA VEGA

Orchard, (William) Arundel (*b* London, 13 April 1867; *d* at sea, 7 April 1961). Australian music educationist, conductor and composer of English birth. After abandoning plans for a career in architecture, he studied the piano, the organ, the viola and singing, taking the BMus at Durham in 1893. After teaching at St Paul's School, London, he travelled in 1896 to Australia, where he was director of music first at St George's Cathedral, Perth, then at St David's Cathedral, Hobart. In 1903, after further school-teaching in England and New Zealand, he moved to Sydney, where he became conductor of the Sydney Liedertafel, the Sydney Madrigal Society and the choir of the Great Synagogue. In 1908 he conducted the inaugural concerts of the Sydney SO, and in 1912 co-founded (with George de Cairos Rego) the Musical Association of NSW. Having in 1914 successfully lobbied for the establishment of the New South Wales State Conservatorium of Music, he was appointed to its Advisory Council, and succeeded Henri Verbrugger as director in 1923. During his tenure Orchard managed, through his strong links with the Sydney establishment, to solicit private money for students' scholarships and to raise the calibre of the Conservatorium orchestra, which he conducted in Australia's first broadcast classical concert in 1929. Nevertheless, he remained a controversial figure in the city's musical life. After his compulsory retirement from the Conservatorium in 1934, he established a BMus course at the University of Tasmania, but it did not survive his departure in 1938. He lived in Sydney, active as a music examiner for Trinity College, London, until his death at sea, en route to England.

All his life Orchard composed in a dated English style; his comparable conservatism as an educator and public figure, delayed the development of modernist trends in Sydney. His writings include an autobiography, *The*

Distant View (Sydney, 1943), and *Music in Australia* (Melbourne, 1952). He was awarded the OBE in 1936.

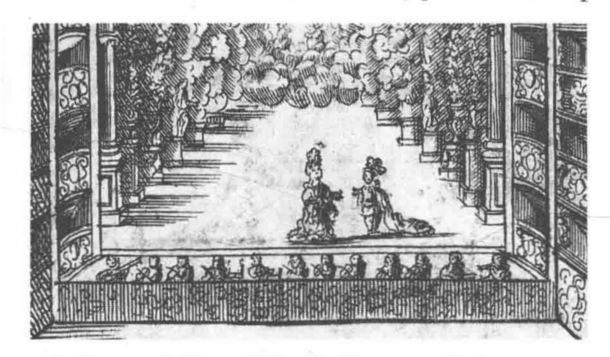
JOHN CARMODY



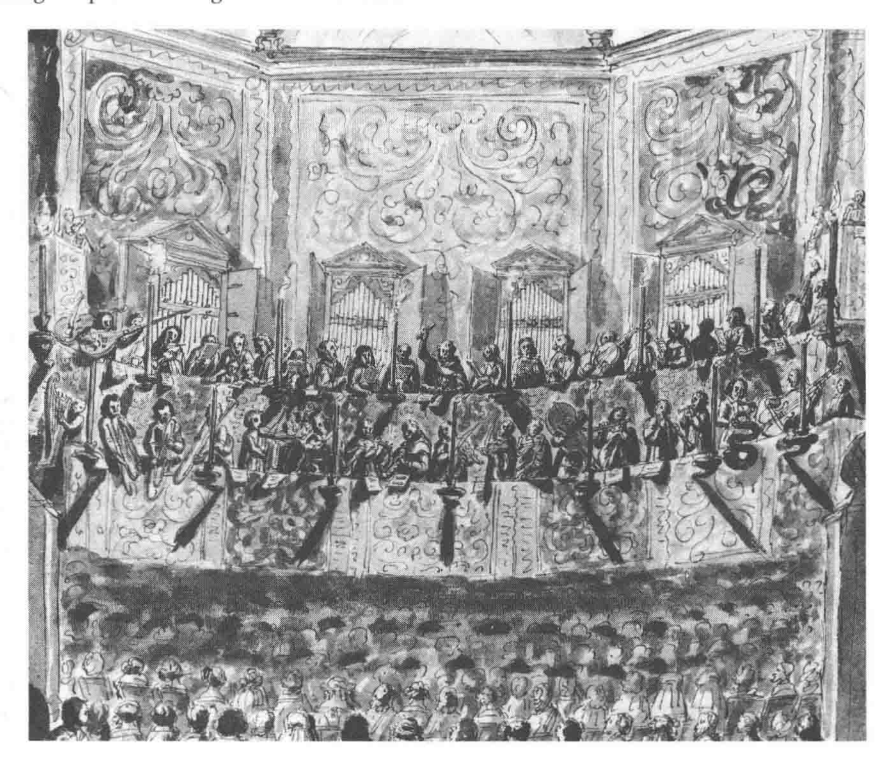
Orchestra (It.; Fr. *orchestre*; Ger. *Orchester*). 'Orchestra' has been used in a generic sense to mean any large grouping of instrumentalists. Thus one reads of an Indonesian gamelan orchestra, a Japanese gagaku orchestra, a Chinese drum and gong orchestra, the 'orchestra' of a Renaissance *intermedio*, or even the 'orchestras' of the Old Testament. In this article, 'orchestra' is treated in a specific and historical sense, as a characteristically European institution that arose in the 17th and 18th centuries and subsequently spread to other parts of the world as part of Western cultural influence. Related information will be found in other articles, for example CONCERT (ii), CONDUCTING and INSTRUMENTATION AND ORCHESTRATION; *see also* BAND (i).

1. Definitions. 2. Etymology. 3. Pre- and proto-orchestral ensembles (1500–1700). 4. Lully and Corelli (1650–1715). 5. The birth of the orchestra (1680–1740). 6. The Classical orchestra (1740–1815). 7. The Romantic orchestra (1815–1900). 8. The modern orchestra.

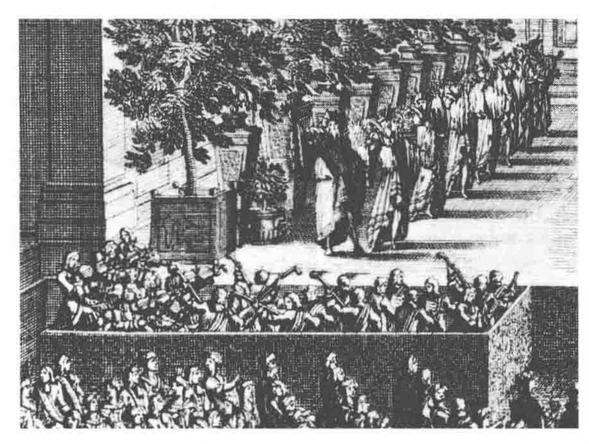
1. DEFINITIONS. Analysis of orchestras from the 18th century to the present reveals a series of interrelated defining traits (Zaslaw, 1988, 1993). (*a*) Orchestras are based on string instruments of the violin family plus double basses. (*b*) This core group of bowed strings is organized into sections within which the players usually perform the same notes in unison. This practice of doubling string instruments is carried out unequally: there will almost always be more violins than lower strings. (*c*) Woodwind, brass and percussion instruments are usually present, in numbers and types differing according to time, place and repertory. (*d*) Orchestras of a given time, place and repertory usually display considerable standardization of instrumentation. Such standardization facilitates the circulation of repertory among orchestras. (*e*) Most orchestras are standing organizations with stable personnel, routines of rehearsal and performance, an administrative structure and a budget. (*f*) Because orchestral music requires many instrumentalists to play the same thing at the same time, orchestras demand a high degree of musical discipline. Such discipline involves unified bowing, the ability to play at sight and strict adherence to the notes on the page. (*g*) Orchestras are coordinated by means of centralized direction, provided in the 17th and 18th centuries by the first violinist or a keyboard player and since the early 19th century by a conductor.

Instrumental ensembles that manifest all the traits listed above can be designated unequivocally as 'orchestras', wherever they are found and whatever they are called. Ensembles with many but not all of these traits are often called orchestras and can at the least be said to function orchestrally. Orchestras may be further categorized into a number of sub-types, including theatre orchestras, symphony or concert orchestras, string orchestras, chamber orchestras, café or salon orchestras, radio orchestras, studio orchestras and others. This article will give the most attention to theatre orchestras and symphony orchestras.

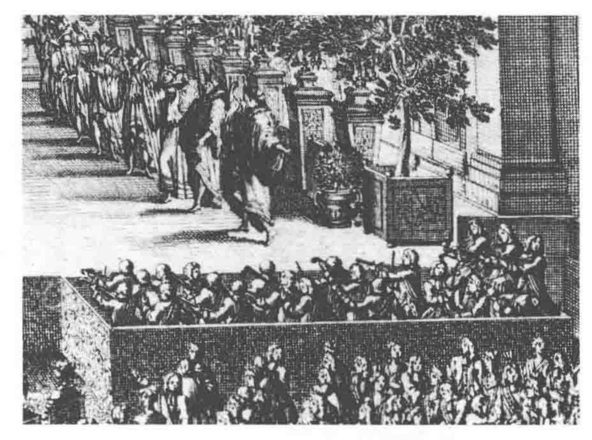
2. ETYMOLOGY. The word 'orchestra', which in ancient Greece and Rome referred to the ground level of an amphitheatre, was revived in the Renaissance to designate the area immediately in front of the stage. In the early 17th century this became a favourite spot to place the instrumentalists who accompanied singing and dancing, and 'orchestra' began to mean 'the place where the musicians sit' (E. Phillips, *The New World of English Words*, London, 1658). By the 18th century the meaning of the word had been extended to the instrumentalists themselves and to their identity as an ensemble (J.-J. Rousseau, *Dictionnaire de musique*, Paris, 1768). Before the word 'orchestra' had established itself in various European languages, a variety of other expressions were used to indicate large ensembles of instrumentalists. In Italian such groups could be called *capella*, *coro*, *concerto*, *concerto grosso*, *sinfonia* or *gli stromenti*. The use of 'orchestra' to designate such ensembles can be dated in Rome from 1679 at the latest. In French one finds *les violons*, *les concertants*, *les instruments* and *la symphonie*. The use of 'orchestre' or 'orquestre' to refer to an instrumental ensemble rather than a place in the theatre appears in French around 1670 at the latest. In German the term *Kapelle* ('chapel') was widely employed in the 17th and 18th centuries as a name for court, church and private musical establishments, meaning instrumentalists and vocalists taken together. In addition Germans designated instrumental ensembles as *Chor*, *die Musik*, *Konzert*, *Symphonie* and *die Instrumenten*. The use of 'Orchester' in this sense turns up in German by 1713 as a borrowing from the French. In English, too, the word was imported from French around 1700, displacing such words as consort, band, company of musick, the musick, musick-meeting and the violins (Strahle, 1995).



1. Orchestra at the Teatro S Giovanni Grisostomo, Venice: engraving, c1709; for the full engraving see VENICE, *fig.6*



3. PRE- AND PROTO-ORCHESTRAL ENSEMBLES (1500–1700). In the 16th and 17th centuries instrumental ensembles, some of them quite large, played for ballets and dances, for operas and other dramatic entertainments, for church services and for banquets. The instrumental ensembles of early opera developed out of ensembles for *intermedi* and similar entertainments at 16th-century courts in Italy and France. These might include lutes, viols, violins, flutes, trombones, trumpets, cornetts, keyboard instruments and others, assembled and deployed variously according to the occasion. The principal roles of the instruments seem to have been to double the singers in vocal polyphony and to provide the remaining parts of a polyphonic texture during vocal solos. In dances, sinfonias or other interludes the instruments played alone. Descriptions of the Florentine *intermedi* of 1539, 1565, 1589, and 1608 provide examples of this sort of instrumentation (Brown, 1973; Coelho, 1998). A similar French practice is seen in the *Balet comique de la Royne* of 1581. The instrumentalists who played for these entertainments were hidden offstage or placed onstage in costume. The scoring for such ensembles has been characterized as 'programmatic': for instance, gods were accompanied by an 'Olympian' ensemble of lutes, viols and harps; flutes, shawms and pipes accompanied pastoral scenes; an 'infernal' grouping of trombones and bass viols evoked the underworld (Weaver, 1961). There seems to have been no notion that a single, standard ensemble should accompany an entire work; instead, groups of musicians with a variety of instruments communicated and reinforced meanings through their costumes and the symbolic associations of their instruments.



During the 17th century, court-sponsored festival operas celebrating occasions of state were accompanied by lavish ensembles of the *intermedio* type, for example in Monteverdi's *Orfeo* (1607, Mantua), *The Triumph of Peace*, a masque for Charles I (1634, London) and Cesti's *Il pomo d'oro* (1668, Vienna). More modestly financed public operas, beginning in Venice in 1637 and soon adopted elsewhere, were accompanied mainly by a small group of strings, harpsichords and lutes, with wind instruments added for special effects (fig.1).

Late 16th- and 17th-century large-scale sacred music was characteristically polychoral and often called for large numbers of instrumentalists. The instruments, however, did not form their own ensemble but were distributed into choirs mixed with the singers, whose parts they usually doubled. Judging from the number of performers, the instruments most often played one-to-a-part. A watercolour by Pierre Paul Sevin of a performance in Rome (fig.2) shows many voices and instruments divided into four similar sized ensembles grouped around four organs. *The Missa salisburgensis*, attributed to Biber, has individual parts for 37 instruments, divided into six ensembles, some mixed with singers, some exclusively instrumental, distributed in various places around the cathedral.

2. Pre-orchestral ensemble at a Roman concert: drawing by Pierre Paul Sevin, pen and brown ink with watercolour, c1670 (Nationalmuseum, Stockholm)

3. Orchestra for a performance of Lully's 'Alceste' in the Cour de Marbre, Versailles, 1674: details from an engraving by Jean Le Pautre from 'Les divertissements de Versailles, 1674' (Paris, 1676), reproduced in PARIS, *fig.13*

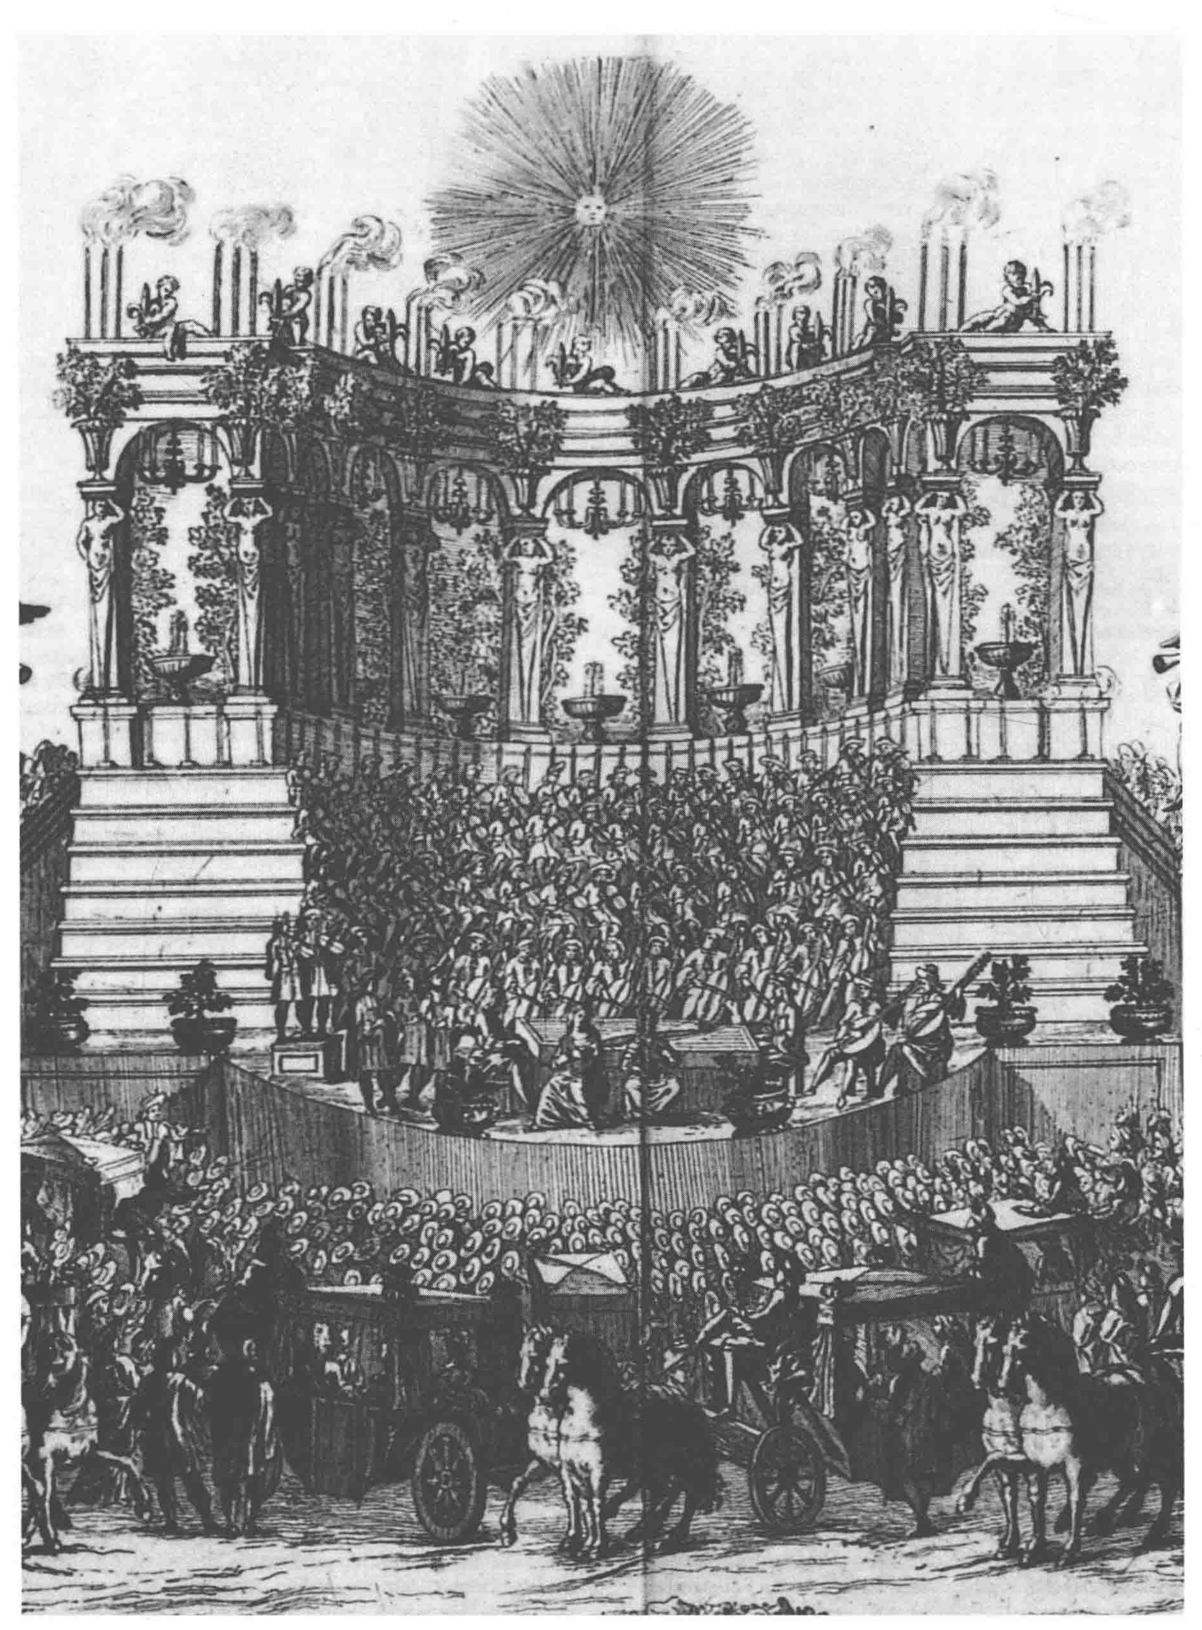
String bands or consorts, made up of viols or violins of several sizes, with four to six players performing one-to-a-part, were popular in many parts of Europe during the 16th and 17th centuries. For balls, weddings, dining in state and similar social events the more penetrating violins were favoured, playing an international repertory of dances, often from memory. By the end of the 16th century Parisian violin bands, which played for civic festivities and also at the court of Louis XIII, had begun to perform their repertory with several instruments to each part. By 1607, 12 string players ('violons') held official appointments as the 'violons du Roi', offices that could be passed on to their sons or sons-in-law or sold outright. A court document of 1618 mentions '24 violons ordinaires', who received a New Year's bonus (Bardet, 1992). The ensemble remained the '24 violons du Roi' for over a century, until it was abolished by royal decree in 1761. Marin Mersenne in 1636 described how the 24 violins were disposed in their characteristic five-part texture: six *dessus* (violins), four *haute contres* (small violas), four *tailles* (medium-sized violas), four *quintes* (large violas) and six *basses de violon* (oversized cellos). The development of a similar court string band in London at about the same time was cut short by the Interregnum (Holman, 1993). Violin bands, sometimes with several players on the parts, were also assembled at the Spanish court of Naples, in Sweden at Queen Christina's court and in Germany at several courts, including those at Wolfenbüttel, Kassel and Stuttgart. The French violin bands, with violin-family instruments in five sizes, unequal doubling and a repertory of dance music, can be singled out as the origin of the orchestra.

4. LULLY AND CORELLI (1650–1715). Jean-Baptiste Lully's rise to power at the French court had profound musical implications, not just in France but for all of Europe. In 1653, at the age of 20, Lully was appointed *compositeur de la musique instrumentale*, which made him leader of his own violin band, the Petite Bande (Petits Violons, Violons du Cabinet). In 1664 he was made head of the Grande Bande (the 24 Violons du Roi). In 1672 he took over the Académie Royale de Musique (the Paris Opéra). The Grande Bande had 24, the Petite Bande perhaps 18 string players; for large-scale court performances Lully occasionally combined the two. He could also call upon woodwind players, trumpets and timpani of the Grande Ecurie (musicians attached to the cavalry). When in 1664 Lully pulled together these and additional forces for a multi-day entertainment at Versailles called *Les plaisirs de l'isle enchantée*, he used them in typical pre-orchestral fashion: consorts of like instruments, in costume, joined together on an ad hoc basis (Lemaître, 1991). Ten years later, when Lully produced his opera *Alceste* as well as Molière and Charpentier's *comédie-ballet Le malade imaginaire*, at a similar entertainment, he organized his instrumental forces very differently. The engravings of the 1674 events show large ensembles of bowed and plucked strings placed in two boxes in front of the stage, not in costume but in livery (fig.3). At the stage apron a man with a short baton, perhaps Lully himself, beats time for the singers and instrumentalists. Much as this looks like an orchestra, it is likely that the bowed strings played only for the overture, entr'actes and dances, while the plucked strings accompanied just the vocal music. Lully's 'orchestra' was famous for its unanimous attack (the *premier coup d'archet*), for using short bowstrokes, for bowing up and down in unison, and for the tastefulness of the ornamentation that the players added to the notes on the page (Zaslaw, 1990, 1993; Kolneder, 1970).

These innovations in instrumental ensembles and ensemble playing made a brilliant impression on visitors to the French court. Princes in neighbouring lands, especially Germany, sought to create Lully-style ensembles at their own courts. They engaged French violinists and oboists for their own Kapellen; they sent German musicians to Paris to learn the new style and bring it back home. In consequence, Lully's orchestral style is best documented in the prefaces to publications by German composers: the *Florilegium I* and *II* by Georg Muffat (Augsburg, 1695; Passau, 1698), J.C.F. Fischer's *Journal de printems* (Stuttgart, 1695) and J.A. Schmierer's *Zodiaci musici* (Augsburg, 1698). The German Lullistes for the most part worked at small courts with limited instrumental resources; only Schmierer discussed string doubling. Lully's ensemble with doubled strings, oboes and bassoon provided an important model of orchestral scoring to several generations of French, English and German composers.

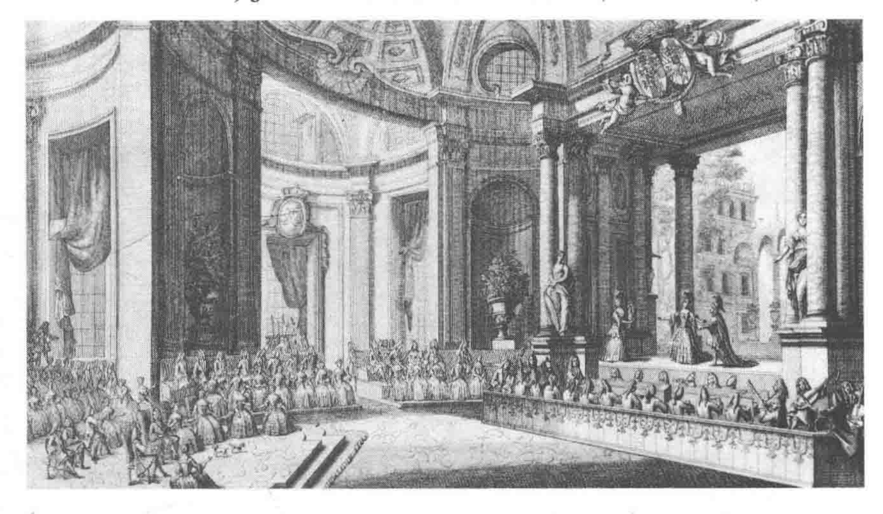
The fashion for large violin bands reached Italy as early as the 1660s. In a *Serenata* by M.A. Cesti, performed at the Florentine court in 1664, the sinfonias were played 'with the instruments doubled following the practice of

concerts in France, that is, with six violins, four alto violas, four tenor violas, four bass violas, a contrabass, a high-pitched spinet and a large spinet, one theorbo and one archlute' (Wellesz, 1913–14). In Rome there was no single large-scale employer of musicians comparable to the courts of France or Florence; instead, cardinals, foreign ambassadors, Roman nobles, churches and other institutions each employed a handful of musicians, mainly keyboardists and string players. For important occasions these musicians could be called together to play in a large ensemble under unified leadership. From about 1680 until 1712, the leader of almost all such ensembles was Arcangelo Corelli, who acted as contractor, artistic director, leader (concertmaster) and, not infrequently, composer. In 1687, for instance, Corelli led two public concerts in specially constructed 'theatres' in the Piazza di Spagna, one sponsored by the French ambassador, the other by the Spanish ambassador. Of the first, celebrating the recovery of Louis XIV from an illness, a commentator wrote:



> There was a large platform for the singers and instrumentalists, who started out with a beautiful sinfonia of concerted instruments by the famous Arcangelo [Corelli] Bolognese, who had assembled together all the best string players in Rome. Then two vocalists accompanied by the orchestra sang a poem in praise of the King. The audience listened in profound silence.

For the nameday of the Queen of Spain, the Spanish ambassador put on a specially commissioned *Applauso musicale* by Bernardo Pasquini. An engraving of the performance shows an ensemble of over 60 string players, plus a continuo group of two harpsichords and a pair of archlutes (fig.4). The ensemble is led by two violinists standing on a raised platform at the far left, presumably Corelli and his assistant, Matteo Fornari (Marx, 1988; Spitzer, 1991). Payrolls for similar occasions confirm that this picture does not exaggerate: Corelli's orchestra often exceeded 40 players, and for oratorios it could grow to more than 70 (Marx, 1968, 1983). Corelli, like Lully, cultivated a high level of orchestral discipline in his ensemble. According to the testimony of Geminiani, 'Corelli regarded it as essential to the ensemble of a band, that their bows should all move exactly together, all up, or all down; so that at his rehearsals, which constantly preceded every public performance of his concertos, he would immediately stop the band if he discovered one irregular bow' (*BurneyH*). The repertory of Corelli's orchestra, like Lully's dance music, was printed, disseminated and imitated throughout Europe. His op.6 concerti grossi, in which a large ensemble of massed strings alternated with a small concertino of two violins and cello, became another model of orchestral scoring for the next generation of composers.

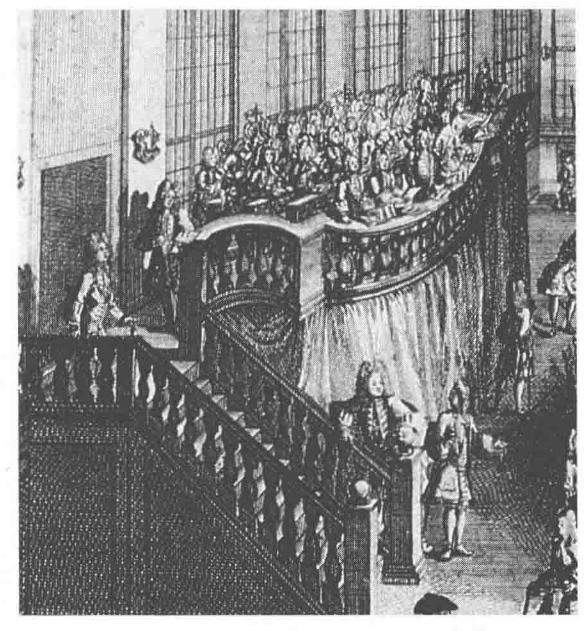


5. The birth of the orchestra (1680–1740). The history of the orchestra from the 17th century to the present involves consideration of how many instruments and of what kinds this ensemble comprised, how these instruments were used, the training and career paths of instrumentalists who performed in orchestras and the roles that orchestras played in society. Such a history shows that local traditions did not always conform with the broader picture. Nonetheless, in many cities and courts between about 1680 and about 1740, parallel changes can be observed in instrumental ensembles: the number of strings (especially violins) increased; the Renaissance wind instruments (cornetts, shawms, curtals etc.) were replaced by French-type 'Baroque' recorders, flutes, oboes and bassoons; pairs of horns were added; and a 16′ bowed bass instrument joined the orchestra, first as an occasional novelty but eventually as a permanent member. These characteristics began to appear in France and Italy by the 1680s and in Germany and England by 1700. In addition, the organization and performing practices of instrumental ensembles became more 'orchestral'. Rather than being split into separate ensembles, instrumentalists were gathered into a single group. Instead of playing several instruments with the same range or function, instrumentalists began to specialize on particular instruments. One member of the ensemble, usually a violinist, was designated as leader for purposes of setting tempos in instrumental numbers and deciding on bowing and ornamentation. Finally, orchestras began to call attention to themselves as a central feature of musical events. In the theatre they occupied a prominent place (fig.5); elsewhere they are displayed on risers (fig.4), in balconies (fig.6) or on a stage. They played pieces, or long sections of pieces, without singers, and commentators began to note and to compare orchestras and orchestral performances. By the 1730s and 40s the 'orchestra' – by that time called by its own name – was recognizable as an institution in most parts of Europe.

6. The Classical orchestra (1740–1815). Because the orchestral works of Haydn, Mozart and especially of Beethoven were maintained in the repertory as 'classics' from the early 19th century onwards, the orchestra for which the Vienna masters composed has come to be known as the 'Classical' orchestra. The term may usefully be extended to include orchestras from about 1740 until 1815 or even later. For the first part of this period, from the 1740s to the 1780s, a typical orchestra included violins, violas, cellos and double basses, a pair of oboes, a pair of horns, one or two bassoons and keyboard continuo (harpsichord or organ). Trumpets and timpani were optional. Violins were divided into two sections of approximately equal size; violas (except in France) were consolidated into a single section, although composers occasionally wrote 'divisi' parts for them. Cellos, double basses, bassoons and keyboard usually played the same *basso* line, although cellos and bassoons had occasional obbligato passages, and the keyboard player added improvised harmonies above the bass. Oboists often played the flute as well, so these instruments could be interchanged but typically did not play simultaneously. This was the orchestra for Italian opera throughout Europe; it was also the typical configuration for spoken theatre, for private and public concerts, for important church services, and for dancing. For special occasions the orchestra could be enlarged by increasing the size of the string sections or even doubling the wind. Unusual instruments could be added for special effects: trombones for underworld scenes, flageolet to imitate birds, clarinet or chalumeau to suggest shepherds. In modest venues, for routine occasions or when money was short, the orchestra could be reduced to pairs of strings or even single players on the four parts, plus oboes and horns (fig.7).

In the theatre the orchestra was placed in front of the stage at floor level, separated from the audience by a rail. In the most common seating plan two long rows of violinists faced one another across double-sided desks which held the music (fig.8). Oboes, flutes and violas were distributed among the violins, whose parts they often

4. Performance of the 'Applauso musicale' by Pasquini on a specially erected 'theatre' in the Piazza di Spagna, Rome, to celebrate the nameday of Marie-Louise, Queen of Spain, in August 1687: engraving by Christoph Schor; for the full engraving see ROME, *§II, 3, fig.16*



5. Orchestra for the opera 'Ricimero' (perhaps Gasparini's 'Flavio Anicio Olibrio') performed in the theatre of the Palazzo Reale, Turin, as part of the celebrations marking the arrival of the Princess of Piedmont in 1722: engraving by Antoine Aveline after Filippo Juvarra

doubled. Italian opera often used two harpsichords, one on the left side, one on the right, each surrounded by a group of cellos, basses and bassoons playing the *basso* part (fig.8). Orchestral seating for concerts, oratorios, dances and serenades manifested great variability from one place or one occasion to another (figs.9, 10, 11). During most of the 18th century, printed orchestral music was typically offered in *à 8* format: four string parts plus oboes and horns. This sufficed for an orchestra of 14 to 16 players; for larger orchestras, additional parts were copied out by hand. Similarly orchestral music in manuscript tended to circulate as sets of single parts, with extra parts (doublets) for violins and *basso* copied out as needed.

By the last two decades of the 18th century previously optional or interchangeable instruments, including flutes, clarinets, trumpets and drums, had become indispensable. Thus Haydn, Mozart and Beethoven composed for an orchestra of strings, plus pairs of flutes, oboes, clarinets, bassoons, horns, trumpets and timpani. This may be called the 'high-Classical' orchestra (Zaslaw, 1991). The configuration is found as a general practice, however, only from the 1790s: of Haydn's more than 100 symphonies, only four (nos.99, 100, 103, 104) call for those forces, as do only two (the Paris and the Haffner) of Mozart's more than 50. Beethoven and such contemporaries as Spontini, Méhul and Rossini began to transform this ensemble, giving the double bass its own part, adding a third horn part and sometimes a fourth, and making trombones an obligatory part of the orchestra.

In France, and especially in Paris, orchestral development followed a somewhat different course. The orchestra of the Opéra during the first quarter of the 18th century was still organized as it had been in Lully's day. It was divided into two groups with separate personnel and different roles, a *petit choeur* and a *grand choeur* (La Gorce, 1990). The *petit choeur*, which at the beginning of the period consisted of harpsichords, lutes, theorbos, bass viols and cellos, accompanied song, that is, recitatives, airs and vocal ensembles. The *grand choeur*, a five-part string band plus wind (about 30 instruments in all), played overtures, descriptive symphonies and dance music; it also accompanied choruses. The differentiation between *petit*and *grand choeur* was maintained at the Opéra until 1778, but the make-up of both groups changed. The *petit choeur* added a pair of violins and later one or two flutes to play obbligato parts in songs. In the *grand choeur* the number of violins increased, while the violas decreased. By the 1720s the violins had been divided into firsts and seconds, and there were only two viola parts (*haute-contre* and *taille*); in the 1740s the violas were consolidated into a single section, and the Opéra joined other European orchestras in four-part string scoring. Wind instruments, which before had mainly doubled the strings of the *grand choeur*, were now given more independent parts; horns were added in 1759 and also clarinets, first as supernumeraries (1749), later as regular members of the orchestra (1771). Both the Opéra orchestra and the orchestra of the Concert Spirituel, whose personnel overlapped considerably, were led by a baton-wielding *batteur de mesure* (fig.12). Other Paris orchestras at the Comédie Française, the Théâtre-Italien, the Concert des Amateurs and La Pouplinière's salon were organized more like Italian and German orchestras,

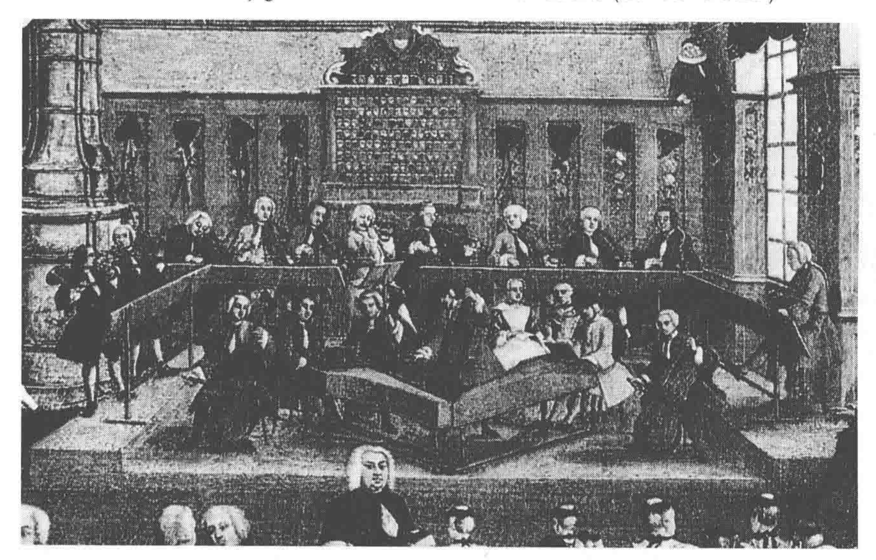
7. 'Concerto' for strings, horns, oboes and harpsichord: engraving from 'Zürich Musicalische Neu-Jahrs-Geschenke' (1744)

as unitary ensembles with four-part strings and pairs of winds, directed by the first violinist. By the 1780s the large Paris orchestras had come to resemble high-Classical orchestras across Europe, with whom they now shared a pan-European orchestral repertory.



The shift from early- to high-Classical orchestra can be seen in two developments found in many orchestral works of the 1780s and 90s: the wind instruments become full and equal participants in the orchestration; and the generic bass line is differentiated into independent parts for bassoons, cellos and double basses. To their earlier functions of doubling or alternating with the strings and sustaining slow-moving harmonies in the tuttis, the wind add a new role: they participate in the presentation and development of thematic materials. As soloists, in pairs or in other combinations, wind instruments emerge from the orchestral texture and play a bar or two of melody, then relinquish their place to other instruments. This kind of orchestration may have been associated with the rise of specialist wind players, who no longer doubled on several instruments but were virtuosos on a single one. The second development was tied to the decline of the

keyboard continuo. As pianos, with their softer tone, replaced harpsichords towards the end of the 18th century, the keyboard instrument became less useful for supplying the harmonies, guiding the singers and directing the instrumental ensemble. Singing, both in the theatre and on the concert stage, was accompanied increasingly by the full orchestra rather than just by continuo. A keyboard instrument often remained in the orchestra as a place from which a composer could supervise the performance, particularly in opera and oratorio. By the last two decades of the 18th century, however, most orchestras (except in France) were directed by the first violinist. With the end of continuo practice, composers started writing separate parts for cello and double bass, creating in effect a five-part string section, although the double basses often doubled the cellos at the octave.

In the 18th century there were few concert halls devoted primarily to orchestral performance; most orchestral concerts took place in theatres, the great halls of palaces and large houses, inns and other public buildings. In the second half of the century many larger cities had public concert series featuring orchestras, such as the Concert Spirituel in Paris, the Grosse Konzert in Leipzig and the Bach-Abel concerts in London. In principle, anyone could purchase a ticket to such concerts, but most concert series maintained a degree of exclusivity by allowing admission only by costly subscription. Many more such events were under private patronage and open to invited audiences only.

7. THE ROMANTIC ORCHESTRA (1815–1900). The 19th century saw a tremendous expansion of orchestras and their culture. The number of orchestras in Europe increased several-fold; orchestras themselves grew larger and incorporated new kinds of instruments; orchestras became more widely dispersed geographically and appeared in new venues and new social contexts. During most of the 18th century orchestras had been an accompaniment to and an expression of aristocratic court culture; in the 19th century the orchestra became a central institution of public musical life. Orchestras in different places and different venues came to resemble each other in instrumentation, organization and performing practices. Playing in orchestras became a profession, distinct from other kinds of musical work; newly founded conservatories trained instrumentalists as orchestral musicians, and players' associations (later trade unions) were formed to improve wages and working conditions. Concert orchestras became independent organizations with their own property, administrative structure and

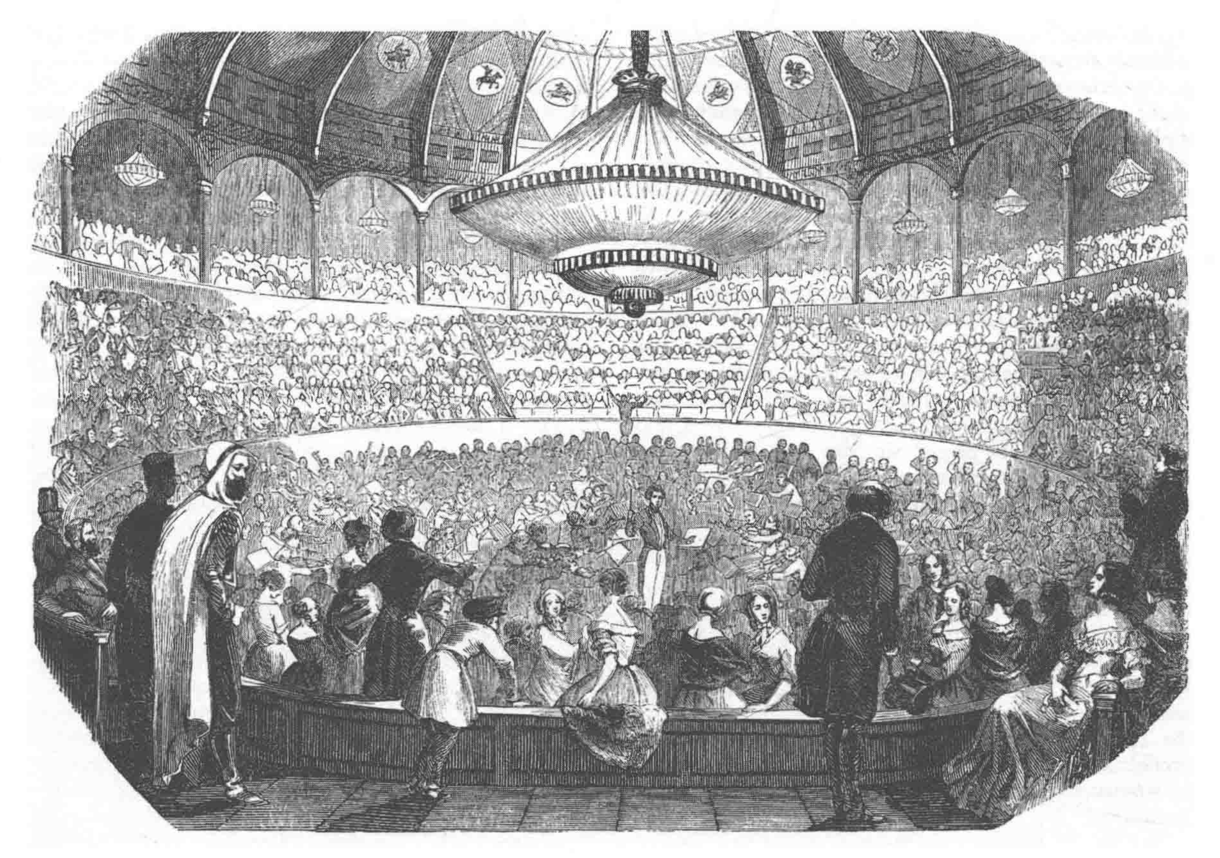
income; concert series were organized in most European cities, with multiple series in the larger ones. Orchestral repertory became increasingly distinct from other kinds of music and increasingly standardized; over the course of the 19th century programme planning became dominated by a limited number of canonical or 'classical' works (Weber, 1986). Alongside such classicizing programmes – which often comprised an overture, concerto and symphony – orchestras continued to perform mixed or miscellaneous programmes with large numbers of shorter works, including operatic excerpts and instrumental solos, which were the precursors of 20th-century 'pops' concerts.

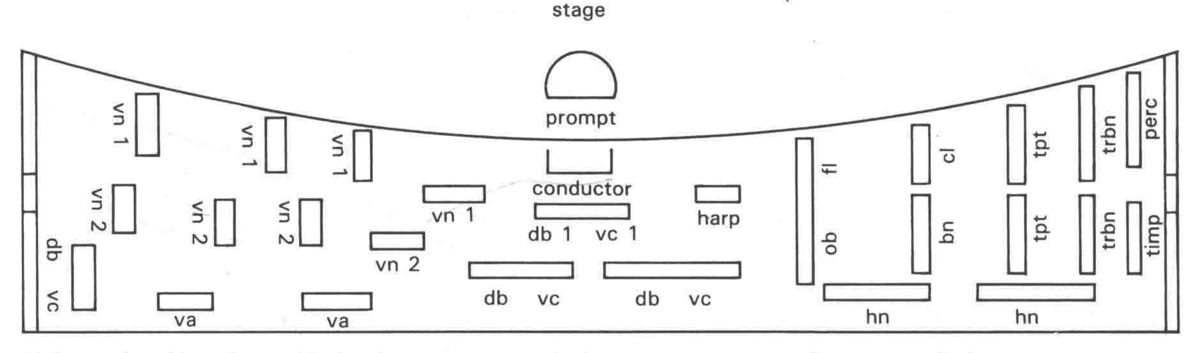
19th-century orchestras divide into two principal types: theatre orchestras and concert orchestras. Theatre orchestras played for both spoken theatre and opera, which often shared the same theatre and the same orchestra. Some theatres (for example those in Vienna, Berlin and St Petersburg) were still appendages of a court; their orchestras were court Kapellen and the players civil servants. More commonly theatres were commercial enterprises, and the orchestra was engaged for one season at a time. However, personnel tended to remain stable year after year. Because of this stability and because the theatre was open several nights a week, employment in a theatre orchestra could form the basis for an instrumentalist's living, indeed for an entire career. Concert series offered only weekly or fortnightly performances, so employment in a concert orchestra could provide only a portion of a musician's living, and concert orchestras shared personnel in most cities with theatre orchestras. As the market for entertainment expanded during the 19th century, other types of orchestra came into being: salon orchestras, café orchestras, dance orchestras, spa orchestras, orchestras in music halls and burlesque houses, and at the beginning of the 20th century in cinemas.

Experimentation and advances in instrument technology during the 19th century led to significant changes in the composition of the orchestra, particularly among the brass. The serpentone, bombardon, ophicleide and cimbasso were added in turn to fortify the lower register of the brass; they were gradually replaced by various forms of tuba, beginning in the 1830s (Meucci, 1996). Even more important was the addition of valves to trumpets and horns, which allowed them to play melodies in their lower and middle registers and to play in various keys. During the first half of the 19th century, valved and natural instruments played side by side in the same orchestras. Wagner, for example, in *Rienzi* (1842, Dresden) calls for two natural trumpets along with two valved cornets, two natural horns along with two valved horns, and both serpent and ophicleide. Woodwind too were redesigned, mainly by adding new keywork, which enabled them to play in any key rapidly and more reliably in tune. Woodwind instruments in new, sometimes extreme registers were added – piccolo, English horn, bass clarinet, double bassoon – but these were usually used only for special effects and played by doublers from the regular wind section. From the 1820s on many orchestras included one or even two harps, often played by women, exceptions in what was otherwise an all-male institution.



Because 19th-century orchestras, especially concert orchestras, continued to play a repertory of symphonies and oratorios from the 18th and early 19th centuries, their structure remained frozen in the pattern of the 'high-Classical' orchestra: five sections of strings, with pairs of wind brass instruments and a small battery of percussion. Keyboard continuo had been eliminated from most orchestras by the second quarter of the 19th century, and opera recitative was accompanied now by the full orchestra or by a solo cello. In the larger opera houses the string sections were expanded for greater volume and the wind were often doubled, with a principal and an assistant on each part; percussion instruments such as cymbals and castanets were added for local colour and special effects. Instrumentalists sometimes appeared on stage in costume as a band (*banda sul palco*, *musique de scène*), usually made up of military instruments like clarinets, cornets, and keyed bugles, with players sometimes borrowed from the local garrison. By using shifting combinations of instruments, opera composers achieved a myriad of orchestral colours and effects. In Wagner's later operas the large orchestra functions as a central element in the drama, setting the scene, hinting at the thoughts and emotions of the characters and commenting on the action through a system of leitmotifs. By the late 19th century the Wagnerian orchestra and Wagnerian techniques of orchestration had made their way into symphonic and concert repertory, for example in the tone poems of Richard Strauss or the symphonies of Bruckner and Mahler.

The biggest structural innovation in 19th-century orchestras was the baton conductor, first in France, where the Opéra and the Concert Spirituel had been directed by time beaters as early as the 18th century, then in Germany, beginning in the 1780s with Reichardt in Berlin and becoming common in German orchestras by the 1820s. English orchestras resisted baton conducting until the 1830s, and some Italian orchestras were still directed by the first violinist as late as the 1860s. Whereas the violin director had led by example, the baton conductor led by directive, communicating with the players through words and gestures rather than through music, although ex-violinists like Habeneck at the Paris Conservatoire kept an instrument handy to illustrate what was wanted. Conductors of the first half of the century did not generally interpret or express the music with the baton but limited themselves in performance to keeping the beat, giving cues and presiding over the ensemble. Soon, however, conductors began to think of themselves (and the public began to think of them) as performers and interpreters, with the entire orchestra as their instrument. 'The members of an orchestra', said Berlioz, 'are like strings, pipes, soundboxes and soundboards of wood or metal – intelligent machines that the conductor plays like an immense piano' (Berlioz, 1843). Wagner, with his controversial and highly influential interpretations of Beethoven's symphonies, introduced into orchestral practice the flexible beat, fluctuating tempos and gradations of dynamics that characterized the playing of such 19th-century instrumental virtuosos as Paganini and Liszt.



Because orchestras functioned in so many different venues and contexts during the 19th century, it is hard to make useful generalizations about their size. Where the same orchestra can be traced over several decades, the impression is often one of growth. The orchestra at La Scala, the court orchestra in Dresden and the London Philharmonic all grew from about 60 players in the 1820s to over 90 in the 1890s; on the other hand, the Paris

Opéra and the court orchestra at Munich remained about the same size over the same period (Koury, 1986; Mahling, 1971; Ehrlich, 1995). Personnel records do not provide a reliable guide to the size of orchestras, because orchestras normally engaged supernumeraries to meet the requirements of whatever piece they were playing. For festival performances 'monster' orchestras were assembled, a tradition that had already begun in the 18th century with the Handel Commemoration of 1784 at Westminster Abbey, which advertised 'at least Four Hundred Performers, a more numerous Band than was ever known to be collected in any country, or on any occasion whatever' (Burney, 1785). Not to be outdone, the Viennese mounted a Handel performance in 1812 with an orchestra of 300. Berlioz, in Paris, organized and conducted several mega-concerts during the 1840s: 450 singers and instrumentalists at the Opéra in 1840 for a programme of music by himself, Handel and (more surprisingly) Gluck and Palestrina; over 1000 performers at the Palais de l'Industrie in 1844 at a concert in which five chorus masters and an assistant conducted simultaneously with Berlioz; 350 for a series of four concerts at the Cirque Olympique in 1844 (again with a second conductor, fig.13). The Handel festivals at the Crystal Palace, London, in 1857 and 1859 featured orchestras of almost 500 instrumentalists accompanying choirs of over 2000 singers (*see* LONDON (i), fig.36). Instead of projecting the wealth and power of the royal court or an aristocratic patron, these monster orchestras were civic and patriotic displays. In their size and in their coordination of diverse elements, they represented the wealth and the capacities of civil society – the musical and social harmony that people could achieve when they set their minds on a common goal.

The seating arrangements of 19th-century orchestras have been studied in detail (Koury, 1986). During the first quarter of the century opera orchestras abandoned the pattern of long parallel rows (figs.5 and 8) and began to sit in pairs facing the centre and reading from stands rather than desks (fig.14). The 18th-century system of arranging instruments according to musical function was replaced by a system of seating in sections by type of instrument. Typical arrangements from the first half of the century placed strings on one side, wind on the other; later it became common to split the first violins from the seconds and the woodwind from the brass. Double basses were sometimes dispersed around the orchestra, in an attempt to make the bass line audible to all players, or they were placed in a row either at the back or at the front of the orchestra, a practice about which Verdi complained, saying that it destroyed the sonority of the basses as a section (Harwood, 1986–7). Concert orchestras displayed no widely accepted seating arrangements, varying according to venue, acoustics, repertory and local traditions. Orchestral seating was a subject of great interest to musicians in the first half of the 19th century, and treatises often published diagrams of famous orchestras. They almost always show the violins at the front of the orchestra, facing one another on opposite sides. The wind were often placed on risers, sometimes quite steep, in the

rear, with the brass at the very back. Violas, cellos and basses might be found almost anywhere. When there was a chorus, it was placed in front of the orchestra or at the sides. The conductor of a concert orchestra usually stood in the centre of the orchestra, among the instrumentalists; often he faced the audience.

In the first half of the 19th century, the public concert joined opera as a cornerstone of musical life in most European countries. Concert series were usually organized by a society established exclusively for the purpose – sometimes a group of professional musicians, sometimes an organization of musical amateurs. The society engaged an orchestra and became in effect its management, raising money, leasing or building a hall and contracting soloists. Some concert societies continued the 18th-century tradition of keeping venues small and prices high in order to maintain social exclusivity; the Philharmonic Society in London and the Société des Concerts du Conservatoire in Paris provide examples of such a policy. Others, like Musard's outdoor concerts on the Champs Elysées, and Jullien's Promenade concerts in London, brought orchestras and orchestral music to mass audiences in large venues at low prices. Several orchestras that have remained in existence until the present day originated as concert series in the 19th century. The London Philharmonic was founded in 1813 as a society of professional orchestra musicians, most of them from the London theatre orchestras. The Vienna Philharmonic began in 1842, also as a self-governing association of professionals, many of whom played at the court opera. The Budapest Philharmonic (1853), the Zürich Tonhalle Orchestra (1868), the Berlin Philharmonic (1887; fig.15), the Concertgebouw Orchestra of Amsterdam (1888) and the Munich Philharmonic (1893) were all founded as concert societies. Other orchestras were established by conductors, acting as musical promoters and entrepreneurs. The most successful and the most notorious was Louis Jullien, who assembled the best players in London during the 1840s for promenade concerts of both modern and 'classical' music, which the public could attend for a modest price (fig.16). Charles Hallé founded the orchestra that still bears his name in Manchester in 1857 to give concerts in the newly built Free Trade Hall, again for large audiences at relatively low prices. Jules Pasdeloup, in Paris, conducted a Concert Populaire from 1861 to 1884 at the Cirque d'hiver for audiences of up to 5000.

15. Arthur Nikisch and the Berlin Philharmonic Orchestra, c1900

16. Louis Jullien conducting the 'British Army Quadrille' for orchestra and four military bands at Covent Garden Theatre: engraving from the 'Illustrated London News' (7 November 1846)

An observer for the *Revue des deux mondes* commented in 1884 on the broad appeal of the Pasdeloup concerts (quoted in Bernard, 1971):

> All levels of society are represented in this multitude. In the parterre you see an elite of connoisseurs and aesthetes; seats in the main amphitheatre are shared by all classes of people; in the upper galleries students from the Latin quarter rub elbows with working men. This whole great attentive crowd holds its breath, waiting for the orchestra's first downbow as if for a revelation from heaven.

Such audiences heard orchestras in other venues, in theatres, music halls and cafés. But the concerts of Jullien, Hallé and Pasdeloup brought them a repertory of orchestral 'classics' and presented orchestras and orchestral music not just as entertainment and accompaniment but as an aesthetic and moral experience.

The 19th century also saw the expansion of orchestras beyond Europe. In the 18th century, Spanish and Portuguese missionaries and colonists had assembled orchestras, sometimes composed of Amerindian instrumentalists, to play in church. By the end of the century there were orchestras in theatres and occasionally in concert settings. In the North American colonies, theatres in New York, Philadelphia and Charleston had small orchestras by the 1750s. Immigration, urbanization and the accumulation of wealth in the 19th century created many more opportunities for orchestras. Theatres in Havana, Rio de Janeiro, Mexico City, Buenos Aires, Lima and other cities established permanent orchestras for performances of spoken drama, zarzuela and Italian opera. In the USA too, almost every city had one or more theatres, and almost every theatre had an orchestra, which played for spoken theatre as well as for opera (*see* NEW YORK, fig.1). Beginning around the middle of the century concert societies were formed, like the Philharmonic Society and the Euterpean Club in New York, the Handel and Haydn Society in Boston and the Germania Music Society in Baltimore, for the purpose of playing the 'classics' of choral and orchestral music. The New York Philharmonic began in 1842 as a cooperative society of professional musicians. The Boston Symphony was founded in 1881, the Chicago Symphony in 1891, the Cincinnati Symphony in 1894, the Philadelphia Orchestra in 1900. During most of the 19th century American orchestras were composed principally of European emigrants, first English and French, then Germans and Italians.

The foremost promoter-conductor of 19th-century America was Theodore Thomas, a German-born violinist who had played in Jullien's orchestra in London, then emigrated to the USA and formed the Theodore Thomas Orchestra in 1862. For almost 30 years Thomas toured with his orchestra, bringing orchestral music to masses of people throughout the country. By the end of the 19th

century orchestras in the USA occupied much the same place in public musical life as they did in Europe.

8. THE MODERN ORCHESTRA. Beginning in the late 19th century and increasingly during the first half of the 20th, concert life became dominated by the music of earlier times (see Grotjahn, 1995). One consequence of this development was that modern orchestras retained the instrumentation and the performing practices of 19th-century orchestras. The technical and social changes that have revolutionized other areas of musical life – electric instruments, electronic amplification, computer sound processing, and the integrated packaging and marketing of video, audio, computer and live media – have, for the most part, passed the orchestra by. At the same time the venues and the roles available to orchestras have been greatly reduced. In theatres, in cafés and at dances orchestras have been replaced by other sorts of ensemble or by recorded sound (Kraft, 1994). Studio orchestras that up until the 1970s recorded background music for films, radio and television have been replaced by electronics. On the other hand, the number of concert orchestras has increased during the course of the 20th century, and the audience these orchestras reaches has increased even more, thanks to tours, radio and television broadcasts and especially to LP and CD recordings. To a great extent the modern orchestra has become a museum, an isolated, self-contained institution dedicated to the preservation and the dissemination of culturally valued artefacts (see Burkholder, 1986).

Of the many new musical instruments that were invented during the late 19th century and the 20th, almost none has found a regular place in the modern orchestra. Saxophones, cornets, flugelhorns and Wagner tubas made brief appearances, then vanished largely. Electronic instruments like the theremin, the ondes martenot, the Moog synthesizer and the electric guitar have been used, sparingly, usually as novelties or for special effects. Tape recorders and computer-generated and/or altered sounds have not moved beyond the status of experiments. The only true expansion of the instrumentarium of the modern orchestra has come in the percussion section, where a large battery accumulated during the 20th century, with many of the instruments borrowed from non-European cultures, for example temple blocks, gongs, maracas, guiro etc. (fig.18). The piano was reintroduced into the orchestra, more or less as a member of the percussion section rather than as a harmonic or a continuo instrument.

Although instrumentation remained more or less static during the 20th century, changes in instrument construction and performing practices make modern orchestras sound somewhat different from their predecessors. In the 19th century and the first half of the 20th the necks of string instruments were lengthened, bass bars were reinforced, and the strings were tightened to higher tension. By the middle of the 20th century steel E strings had replaced gut as the norm for orchestral violins. Gut-core lower strings on violins, as well as on violas and cellos, were displaced by strings with steel and later synthetic cores, overwound with metal. These changes increased the volume and brilliance of the string section. In the first quarter of the 20th century orchestral violinists began increasingly to use continuous vibrato, and by the 1930s vibrato had become a normal part of tone quality for string sections. Woodwind players took up vibrato, beginning with French, Russian and American players, followed by the middle of the century by English, Italians and Germans. The fluctuating tempos of the Wagnerian conducting tradition were replaced by the more regular

17. 'Orchestra' by Max Oppenheimer, 1921–3 (private collection); note the conductor's features are reminiscent of Mahler

18. London Philharmonic Orchestra performing Messiaen's 'Turangalîla-symphonie' at the Royal Festival Hall, London, 21 March 1998, with Mark Elder (conductor), Peter Donohoe (piano) and Cynthia Millar (ondes martenot); note the large percussion section with 8 players to the back and left of the orchestra

beat of Toscanini and other 'modern' conductors; loose ensemble was replaced by mechanical precision. These changes in orchestral sound and performing practice are documented in recordings from the first half of the 20th century (Philip, 1992). In the second half of the 20th century the orchestral palette was enlarged with 'extended' techniques of instrumental playing: harmonics, microtones, *sul ponticello*, *col legno* etc. in the strings; multiphonics, hypervibrato, flutter tonguing, glissando etc. in the wind.

A minor rebellion against the tradition of the orchestra as it was inherited from the 19th century occurred after World War I with the idea of the 'chamber orchestra', a considerably smaller ensemble, with only a few strings on each part and only selected woodwind and brass. Chamber orchestras represented in part a response to the cost of large orchestras, in part a modernist reaction to what had come to be seen in some circles as the overblown rhetoric of the late Romantic repertory. Chamber orchestras tend to play a bifurcated repertory, comprising old music, much of it from the 18th century, plus specially commissioned works by such composers as Stravinsky, Bartók, Hindemith, Milhaud, Honegger and Britten. A few chamber orchestras maintain themselves as independent ensembles, for example the Basle Chamber Orchestra (founded in 1926), the English Chamber Orchestra (1948), I Musici (1952), the Moscow Chamber Orchestra (1955) and the St Paul Chamber Orchestra (1959). Some chamber orchestras returned to the 18th-century practice of performing without a baton conductor, either out of historicizing motives (I Musici) or for political reasons (Moscow 'Persimfans', 1922–33).

Beginning in the 1970s, a new kind of chamber orchestra made its appearance: the 'early music' or 'period-instrument' orchestra (fig.19). These orchestras attempt to revive the instruments, the playing techniques and the repertories of the 17th and 18th centuries. Since they use different instruments from most modern orchestras ('Baroque' violins and bows, two-key clarinets, one-key wooden flutes, harpsichords etc.) as well as different playing techniques (no or very little vibrato, keyboard or violin direction, improvised ornamentation etc.), period-instrument orchestras tend not to share personnel with symphony orchestras, but instead to operate in a separate world of early music specialists. Many early music orchestras are ad hoc ensembles, assembled for a recording session or a concert series. However a few, like the Concentus Musicus (Vienna), the Philharmonia Baroque Orchestra (San Francisco) or Tafelmusik (Toronto) have achieved a more stable institutional existence.

Modern symphony orchestras perpetuate the organizational and institutional structures established in the second half of the 19th century. Two basic patterns obtain, one descended from the court orchestra, the other from the concert series. In the first, the orchestra is owned and managed by the state, the municipality or another public entity. Often the sponsor is a state-owned radio station, as for example with the BBC Symphony Orchestra (London) or the Norddeutscher Rundfunk Sinfonieorchester (Hamburg). The musicians have civil service jobs; managers are government or civic functionaries; the instrumentalists often exercise a considerable degree of self-governance. This pattern is typical of continental Europe, Latin America and to some extent Great Britain. The second type of organization prevails in the USA and to a lesser extent in Great Britain. Here the orchestra is an independent, non-profit corporation, run by a lay board of directors and by professional managers who are responsible for day-to-day operations. Under this system government agencies often provide modest subsidies. Orchestras may also be subsidized by private, non-profit foundations, like the Ford Foundation, which between 1966 and 1976 distributed over $80 million to 61 American orchestras (Hart, 1973). A few orchestras are organized as cooperatives, for example, the Vienna Philharmonic, the London Philharmonic, the London Symphony and the Israel Philharmonic. Here the orchestra is owned and administered by the musicians themselves, though often with a state subsidy and considerable input from professional managers. Under all three systems labour unions play an important role; in almost every major professional orchestra in Europe and North America the musicians are members of a union. The union represents the players in negotiations over wages, hiring practices, job security and working conditions. Rehearsal and concert schedules, recording sessions, seating order,

19. Orchestra of the Age of Enlightenment performing in the Royal Concert Hall, Glasgow, 1990

travel arrangements, the hiring of supernumeraries or substitutes, audition protocols and the prerogatives of the conductor are all governed by the provisions of the union regulations or contract.

Most modern orchestra musicians are trained at music conservatories, usually specializing on a primary instrument by their teen years. Upon graduation young instrumentalists may work for a while as freelancers or hold a series of positions in smaller orchestras, attempting with each job change to move up either to a better orchestra or a better position in the section (Faulkner, 1973). However, they tend to settle down at a relatively early age compared with other professions and to play in the same orchestra for the remainder of a career that can last until the age of 70 or older. Although a career as an orchestra musician is not dangerous or physically taxing, surveys of orchestra musicians often find them to be dissatisfied with their profession, their jobs and their careers. This dissatisfaction has been attributed to a variety of factors, including stress of performance, limited scope for individual expression, frustration of soloistic ambitions and hostile relations between players, conductors and management (Schulz, 1981; Faulkner, 1973).

One of the most important developments in the second half of the 20th century has been the entry of women into orchestras. Before that time, although many women were trained as instrumentalists, the only opportunity they had to play in symphony orchestras (except for harpists) was in all-woman orchestras (Neuls-Bates, 1986). During World War II women players in the USA took the places of absent men, and after the war some of them remained, particularly in the string sections and in less famous, less well-paid orchestras. The numbers of women in American and British orchestras increased slowly during the 1950s and 60s, more rapidly in the last quarter of the century. Women entered later into continental orchestras and encountered even more obstacles. Most major German orchestras did not accept women until the 1980s, the Vienna Philharmonic not until the late 1990s. In the mid-1990s, the median proportion of women in major USA orchestras was 36%, in Great Britain and France 30% and in Germany 16% (Dupuis, 1993; Allmendinger and Hackman, 1995). Given the number of women instrumentalists in conservatories and the increasing numbers of women in the workforce, these percentages can be expected to increase.

Another important development since the mid-20th century has been the expansion of orchestras and orchestral culture to East Asia. Already in the late 19th century the European community in Hong Kong sponsored concerts by an amateur orchestra, and Shanghai maintained a Municipal Orchestra, staffed exclusively by European instrumentalists. Orchestral music was introduced to Japan as part of the westernizing programme of

the Meiji Restoration. The first orchestra concert is said to have been a performance of Beethoven's First Symphony at the School of Music in Tokyo in 1887 (Obata, 1987). The New Symphony Orchestra (today the NHK Symphony Orchestra) was founded in Tokyo in 1926. Korean musicians, trained in Japan on Western instruments, gave a few orchestral concerts in Seoul during the 1920s, and in the 1930s an orchestra of Chinese musicians gave concerts in Shanghai. The great period of growth, however, came after World War II, encouraged by Asian musicians studying at European and American conservatories, tours of Western orchestras in Asia and especially by broadcasts and recordings of Western orchestras. By the 1970s there were at least eight professional symphony orchestras in Tokyo, some of them owned by the government, others by private entities, like the Japan Broadcasting Company (NHK) or the Yomiuri Nippon publishing group. The Seoul Philharmonic was founded in 1957; the Taibei City Symphony in 1969; the Hong Kong Philharmonic in 1973; the Singapore Symphony in 1979. In mainland China the Shanghai Philharmonic was reorganized with Chinese personnel, and the Central Philharmonic (Beijing) was founded in 1956. Orchestras were also established at several music conservatories. Although their artistic and social goals were the subject of intense debate and conflict, and although Western works were banned from their repertory during the Cultural Revolution (1966–76), Chinese orchestras survived as institutions. By the 1990s there were Western-style orchestras in most of the major cities of China, with multiple orchestras in Beijing, Shanghai and Hong Kong. In 1987 the Central Philharmonic toured the USA with a programme that included works by Berlioz, Dvořák, Ravel and Shostakovich, as well as works by Chinese composers. In Japan, Korea, Taiwan and even mainland China the orchestral repertory is dominated by the same 'classics' that European and American orchestras play, enriched with a smattering of works by modern Asian composers. A few of these introduce traditional instruments, such as *shakuhaci* (flute), *biwa* (lute), *pipa* (lute) and *erhu* (fiddle) into the orchestra, usually in a solo role rather than as orchestral instruments. It does not seem likely that the expansion into Asia will fundamentally alter the instrumentation or the performing practices of the orchestra. Many Asian instrumentalists, however, have joined European and American orchestras, particularly from the 1960s on and particularly in the string sections.

Contemplation of the future and the fate of the orchestra as an institution has generated a good deal of anguish in the last quarter of the 20th century. The disappearance of orchestras from many venues and contexts where they once played, the concentration of the repertory on a limited number of works composed long ago, the aging of concert audiences, the dependence of orchestras on support from the state or from foundations: all these have led critics to proclaim that the orchestra is dying. On the other hand, the health and vitality of chamber orchestras and period-instrument orchestras, the expansion of orchestras into Asian countries, and the power of recordings to expand the audience and the market for orchestral music all suggest that the orchestra may have a few more years left in it as an institution, perhaps a few more centuries.

JOHN SPITZER, NEAL ZASLAW

Orchestral. A prefix denoting an ORGAN STOP of particularly imitative tone, found in many early 20th-century organs.

Orchestral chimes. *See* TUBULAR BELLS.

Orchestra of St John's, Smith Square. London orchestra founded in 1967 and known as the Camden Chamber Orchestra until 1973. *See* LONDON, §VII, 3.

Orchestra of the Age of Enlightenment. British orchestra. Established in 1986, it has made a reputation as one of the world's leading period-instrument ensembles, with a repertory ranging from Purcell, Bach and Handel, through the Viennese classics to Brahms and Wagner. The OAE has performed and recorded frequently under such conductors as Frans Brüggen, Ton Koopman, Sigiswald

Kuijken and Gustav Leonhardt. In 1992 Brüggen and Simon Rattle were appointed principal guest conductors, and the same year the OAE was invited to become associate orchestra at the South Bank Centre in London. It has appeared regularly with Rattle and William Christie at the Glyndebourne Festival since 1989, made its début at the Salzburg Festival in 1991, its Covent Garden début, in Verdi's *Alzira* under Mark Elder, in 1996, and its US début at the Mostly Mozart Festival in 1998. The orchestra opened its 1999–2000 season with a Beethoven cycle in London and Birmingham under five different conductors. Its many recordings include Bach's major orchestral works, Haydn's 'Paris' symphonies, Mozart's *Don Giovanni* and *Così fan tutte*, and a series of Schubert masses.

RICHARD WIGMORE

Orchestra of the Eighteenth Century [Orkest van de Achttiende Eeuw]. Period-instrument orchestra, founded in 1981 by FRANS BRÜGGEN. Its members, numbering up to about 45, are drawn from many different countries. Specializing in late Baroque and Classical repertory, it performs almost invariably with Brüggen, its artistic director and conductor. The orchestra, based in Amsterdam, tours internationally and has appeared at many of the leading European festivals. Its recordings include orchestral suites from Rameau's operas and symphonies by Haydn, Mozart and Beethoven.

NICHOLAS ANDERSON

Orchestration. *See under* INSTRUMENTATION AND ORCHESTRATION.

Orchestre de Chambre de la Société Radio-Canada. Orchestra active in QUEBEC, 1954–88.

Orchestre de la Suisse Romande. Orchestra founded in GENEVA in 1918 by Ernest Ansermet.

Orchestrelle. The trade name of a full-sized reed-playing PLAYER ORGAN made by the Aeolian Company of New York in the early 20th century.

Orchestre Philharmonique des Pays de la Loire. Orchestra founded in France in 1971, based in ANGERS and NANTES.

Orchestre Révolutionnaire et Romantique. British period instrument orchestra. Established in 1990, it has extended the concept of period-instrument performance to the 19th and early 20th centuries. Its founder, JOHN ELIOT GARDINER, stresses its Romantic emphasis on colour and 'the pervasive differences in the overall palate of sounds which composers such as Weber, Berlioz and Schumann were committed to reveal'. The orchestra's many recordings include Berlioz's *Symphonie fantastique* and an acclaimed Beethoven symphony cycle.

GEORGE PRATT

Orchestrion. (1) The name given by Georg Joseph Vogler to a large, and, for its time, somewhat revolutionary organ that was first completed in Rotterdam in 1790 and first heard in public in Amsterdam on 24–6 November 1790. The organ, embodying the principles of his SIMPLIFICATION SYSTEM, had four manuals, pedals and 63 stops, all fitted into a case 9′ square. Some of the stops in this organ were free reeds, and these were under variable wind pressure. This, combined with the fact that the entire instrument was enclosed in a swell-box, gave the organ an unusually wide range of expression, possibly its most notable feature.

(2) A term, originally of German origin, widely used in the 19th and 20th centuries to denote a complex MECHANICAL INSTRUMENT played by pinned barrels or perforated cards or paper rolls. Orchestrions are differentiated from the related street and fairground organs by the fact that they were intended only for indoor use, and for the performance of classical music and dances from the orchestral repertory. They were thus more sophisticated in their voicing, capabilities and design than their outdoor counterparts, and required lower wind pressures: otherwise they used similar technology.

An early example of the orchestrion was Maelzel's PANHARMONICON; another instrument of the orchestrion type was Winkel's COMPONIUM. Martin Blessing (1774–1847), a maker of barrel organs in the Black Forest, is said to have been the father of the orchestrion industry in Germany. Among those trained in his workshop were Michael Welte (1807–80) of Freiburg, perhaps the most notable manufacturer of orchestrions, and the pair that went on to found their own business as Imhof & Mukle in 1850. A mechanical concert organ made by the Black Forest maker Georg Strasser in St Petersburg was bought by I.P. Tchaikovsky, father of the composer, and placed in the family home. Other makers included the Kaufmann family of Dresden, who toured England with their instruments in 1851, and such makers of barrel, street and fairground organs as Gavioli and Limonaire in Paris, Bruder and Ruth in Germany, Mortier in the Netherlands and Chiappa in London.

Orchestrions became increasingly popular in the mid-19th century as domestic entertainment for the wealthy and as a substitute for salon orchestras in hotels, restaurants and dance halls, reaching the peak of their popularity in the period between 1860 and 1880. The application of water or electrical power increased their practicality in the 1880s and 90s, and Emil Welte's invention of pneumatic action in 1887 made possible greater mechanical complexity and a wider variety of effects. In addition to various types of imitative organ pipes and percussion devices, some large models also contained piano actions or chimes. Some instruments reversed this arrangement: known as piano orchestrions, they were self-playing pianos with organ pipes and other devices added. Early orchestrions were operated by pinned barrels (*see* BARREL ORGAN, esp. fig.1), but by the end of the 19th century virtually all makers were using punched cards, which were hinged together and transferred from one folded stack to another as they passed through the playing mechanism; this resulted in easier changing, the playing of longer works and economy of space. For a fuller description of the playing mechanism, *see* FAIRGROUND ORGAN.

At the height of its popularity and development, the orchestrion was capable of producing convincing performances of orchestral music, as proved by surviving examples in such collections as the Nationaal Museum van Speelklok tot Pierement in Utrecht. By the early 20th century the punched-card book was replaced by the perforated-paper roll pneumatic system that was developed for the fairground organ and the player piano. The piano orchestrion found a special niche in the cinema, where it was used to accompany silent films. Special types generally known as Photoplayers (a proprietary name

that became a generic term), which combined piano, organ pipes, tubular bells and other percussion effects in a machine that could be played either with a keyboard or automatically using a music roll, were mainly an American innovation, but were also made by Hupfeld in Leipzig (*see* SOUND EFFECTS, §1).

In the early 20th century smaller instruments gave way to less costly player pianos, which developed out of the same technology; the invention of electro-pneumatic organ action made possible full-scale self-playing residence organs which could reach considerable size. The orchestrion could not compete with these, and after the effects of World War I on the German musical instrument industry (particularly Welte) orchestrions were no longer made.

BARBARA OWEN, ARTHUR W.J.G. ORD-HUME

Ord, Boris [Bernhard] (*b* Clifton, Bristol, 9 July 1897; *d* Cambridge, 30 Dec 1961). English organist and conductor. His mother, Johanna Anthes, came of a German family that numbered many musicians. Bernhard (he was later universally known as Boris), the youngest son, went to Cambridge in 1920 as organ scholar of Corpus Christi College. In 1923 King's College recognized his contribution to university life, in particular the foundation of the Cambridge University Madrigal Society, by electing him to a fellowship. A year on the staff of the Cologne Opera broadened his experience and in 1928 he returned to Cambridge to conduct a remarkable performance of Stravinsky's *The Soldier's Tale* with Lydia Lopakhova, Dennis Arundell and Michael Redgrave. Succeeding C.B. Rootham in 1936, he extended the repertory of the Cambridge University Musical Society and conducted many outstanding stage performances, especially Handel's *Saul* (1937) and *Solomon* (1948), and Vaughan Williams's *The Pilgrim's Progress* (1954). Ord's greatest achievement, however, was with the choir of King's College, which became internationally famous through its Christmas Eve broadcasts, European tours and recordings. From 1929 until his resignation in 1957 (except for four years in the Royal Air Force) he maintained a standard of excellence; he demanded of the choir the highest professionalism in matters of intonation, attack and sensitivity to styles ranging from Dunstaple to contemporary composers. The work of former organ and choral scholars such as David Willcocks, John Alldis, Louis Halsey and others shows his influence.

As a keyboard player Ord was much more progressive than many of his contemporaries, and in the early years of the Baroque revival in England he was an imaginative and resourceful harpsichordist. His annual performances from open score of Bach's *Art of Fugue* on the King's College organ were a tour de force. He published one carol, *Adam lay y-bounden* (London, 1957). He was made an honorary MusD of Durham University in 1955 and of Cambridge in 1960; in 1958 he was made a CBE.

HUGH J. McLEAN

Ordinal (from Lat. *ordinarius*, *ordinale*). A liturgical book of the Western Church that describes the ritual practices of a specific cathedral, collegiate church, or monastery throughout the liturgical year. The medieval ordinal adapted Roman use to local customs. *See* LITURGY AND LITURGICAL BOOKS, §II, 4.

Ordinary chants (from Lat. *Ordinarium* [*missae et officii*]). Chants whose texts remain constant from day to day in the services of the Western Church, as distinct from those whose texts vary (PROPER CHANTS). Strictly the term applies to chants from both Mass and Office, but it is chiefly used to refer to the Kyrie, Gloria, Credo, Sanctus and Agnus Dei, the parts of the Mass Ordinary most frequently set polyphonically by composers from the second half of the 14th century onwards. The *Ite missa est* at the close of Mass, with choral response 'Deo gratias', has also been included in a few such settings (e.g. by Machaut). Although the texts of the chants do not vary, they have been influenced by the principle of variation for reasons of liturgical propriety, in that they are recommended, though not prescribed, to be sung to a small corpus of different melodies, each one for use on different occasions (double feasts, single feasts, feasts of the BVM etc.). In the Middle Ages, Ordinary chants for important feasts had trope texts which rendered them Proper in the liturgical sense.

For the transmission of Ordinary chants from the Middle Ages, *see* KYRIALE, the name given to a collection of the chants. *See also* MASS, §I, 2, and separate articles on the chants mentioned above.

□

Ordines romani (Lat., sing. *Ordo romanus*). Liturgical manuals of the 8th century or earlier that describe liturgical practices (Mass, readings for the night Office, Holy Week, ordination etc.) of the city of Rome. Most often the texts, which transmit Roman and papal practice, have been adapted for/to Frankish use. *See* LITURGY AND LITURGICAL BOOKS, §II, 4.

Ordo (Lat.). *See* MEDIEVAL DRAMA.

Ordo cantus missae. The Latin chants appointed to be sung with the Roman Missal of 1970. The foundations for a general revision of the Roman Missal of 1570 were laid by the Second Vatican Council in its Constitution *De sacra liturgia* (22 November 1963). Paul VI promulgated the new missal in an Apostolic Constitution, *Missale romanum*, of 3 April 1969; three days later the new order of Mass was published by the Sacred Congregation *Pro cultu divino*, together with a first draft of the introduction to the new missal, the *Institutio generalis missalis romani*. The new missal itself was published in 1970 and necessitated some considerable revision of the gradual: the *Ordo cantus missae* (1972) was the result. The *Ordo* was followed in 1974 by a new edition of the *Graduale romanum*. All this work was achieved under the *Consilium*, a body made up of several hundred specialists divided into 30 study groups. The group chiefly responsible for the *Ordo* was no.XXV, 'De libris cantus liturgici revisendis et edendis', but the other groups also influenced the final draft.

The *Ordo* followed the revised rubrics and calendar and made provision for a daily sung liturgy in Latin. It appointed chants for the Proper of the Time and of the Saints, and many additional Mass chants for optional use. The Common chants were reorganized to include Masses for new categories of saints, such as religious, teachers, those who exercised works of mercy, and public leaders. A whole section was devoted to ritual Masses, another to Masses for special necessities, and a third to the customary votive Masses. Most of the chants in the new schemes were borrowed from existing Masses. The Ordinary chants include settings of the new or revised portions of the Mass, such as the introductory rites and the acclamations after the readings and after the consecration. Three tones are provided for the Lord's Prayer, one being the so-called Mozarabic, stripped of its interjected Amens.

In their choice and redistribution of Proper chants, the editors aimed wherever possible to retain the most authentic pieces of the oldest layers of the chant. Some inferior compositions of more recent date were discarded. 20 additional pieces of authentic Gregorian chant were introduced and printed in full in the *Ordo*, such as the introit *Memento nostri Domine* (p.29) and the gradual *Posuisti Domine* (p.78); the texts of 11 of them are contained in the *Antiphonale missarum sextuplex* (Brussels, 1935/*R*), a comparative edition by R.-J. Herbert of six manuscripts dating from the 8th century to the 10th, and thus belong to an early layer of the chant. Most of the alleluias, such as the one with the verse *Benedictus qui venit* (p.34), are early adaptations or slightly later compositions.

The principles underlying the provision of musical settings for new or revised texts may be summarized as follows. If a new text already had a musical setting, this was automatically adopted. If no musical setting existed, the new text was adapted to a simple pre-existing tone, such as a collect tone or the *Te Deum*. Occasionally, following an ancient technique of chant composition, a new text was adapted to the music of another text that it closely resembled and that already had a musical setting. 'Mortem tuam annuntiamus Domine et tuam resurrectionem', for example, was cast into the same mould as 'Crucem tuam adoramus Domine et sanctam resurrectionem tuam' from the Good Friday liturgy; and the ending 'donec venias' was modelled on 'donec veniam' from the antiphon *Hic est discipulus meus* for St John the Evangelist (*AM*, p.256), following another time-honoured principle, that of centonization.

MARY BERRY

Ordonez [Ordenitz, Ordoneez, Ordonetz, Ordonitz], **(Johann) Karl (Rochus) von** [Carlo d'] (*b* Vienna, bap. 16 Aug 1734; *d* Vienna, 6 Sept 1786). Austrian composer and violinist. Although an entry in Count Karl von Zinzendorf's diary (23 April 1775) describes him as the 'fils naturel de M. de Buquoy', the baptismal and other archival records describe him as the son of Johann Baptist Christoph von Ordonez – an infantry lieutenant and former owner of property in Neuschloss (now Nové Zámky), Moravia – and his wife Anna Maria Theresa. Ordonez spent the whole of his life in Vienna and, like his contemporary Karl Kohaut, served a dual career as civil servant and musician. His career with the Lower Austrian administration began in 1758 with appointment as an unpaid assistant in the regional court and culminated in 1780 with appointment as *Registrant* with a salary of 1000 gulden. As a violinist Ordonez took part in chamber music performances in the salons of the aristocracy (see Burney and Zinzendorf), and he was also connected with the court chamber music (described by Hiller), although salaried appointment to that body, at 250 gulden per year, did not come until 1779 when he succeeded Karl Huber. In 1784 he led the second violins in a revival of Haydn's *Il ritorno di Tobia* by the Tonkünstler-Societät, which he had joined in 1771. Ordonez's last three years were spent in sickness and poverty: illness forced his retirement on half salary from both his administrative and performing positions in 1783, at which time he had sole responsibility for his two children as his wife had died three years earlier from the disease which was to claim his own life, tuberculosis.

With composers such as F.L. Gassmann, Leopold Hofmann and G.C. Wagenseil, Ordonez helped to define the Viennese Classical style during the period from the 1750s to the 70s. His largest group of compositions consists of over 70 symphonies, most of which are in three movements (fast, slow, fast or minuet-style); less than a dozen are in the more 'modern' four-movement scheme with minuet and trio, and only three have slow introductions. A few may have been designed for liturgical use, including the seven-movement *Sinfonia solenna* (Brown D5) and an antiphonal work with two pairs of trumpets and drums (Brown C10). The most impressive features of the symphonies are their sonorities, textures and rhythms. The composer's lifelong interest in concertante writing and energetic rhythms which propel the music forward recalls Haydn; imaginative thematic links between movements are also a feature; and several symphonies (notably Brown D5 and G7) end with contrapuntal movements which form climaxes to the works as a whole. Less impressive are the modulatory procedures, which are rarely imaginative and occasionally deficient. Of Ordonez's 27 string quartets, the six published as op.1 by Guera of Lyons in 1777 were the most widely distributed. All begin with a slow movement, in the *sonata da chiesa* manner, and contain fugal procedures in either the second or the fourth and final movement, thereby linking them with works by Gassmann and Wagenseil which were designed to appeal to the conservative taste of Joseph II. Ordonez's interest in thematic unity between movements is nowhere more apparent than here. The marionette opera *Alceste*, which was modelled on Gluck, was performed, and probably conducted by Ordonez, at Eszterháza in 1775, and achieved great popularity, as evidenced by the repeat performances at Eszterháza and Vienna (the last as late as 1795); Haydn thought sufficiently highly of it to borrow a minuet for the revised version (?1776) of his marionette opera *Philemon und Baucis*. Ordonez's only other opera, the Singspiel *Diesmal hat der Mann der Willen!* (1778),

was composed for Joseph II's newly formed Nationaltheater but achieved a run of only seven performances.

DAVID YOUNG (text, bibliography), A. PETER BROWN (work-list, bibliography)

Ordóñez, Pedro (*b* Plasencia, *c*1510; *d* Palencia, 5 May 1585). Spanish singer and composer. He was a younger brother of Alonso Ordóñez (*maestro de capilla* of Santiago de Compostela Cathedral for six years and of Palencia Cathedral from 3 April 1536), and took orders in the diocese of Palencia. On 29 April 1539 he was admitted to the papal choir as a bass, remaining there until at least 1550. He was soon chosen to represent the Spanish papal singers in their business affairs, and on 11 January 1545 was elected *abbas* of the papal choir for one year. Ordóñez probably joined the Council of Trent soon after 27 January 1546, and in any case on 11 March 1548 was at Bologna (where the council was then in session) with four other papal singers. Suffering from sciatica, he was allowed sick leave from Bologna on 30 May 1549 to visit the baths at Padua, and on 17 November he returned from Bologna to Rome.

On 24 June 1551 he succeeded his brother Alonso as *maestro di capilla* at Palencia Cathedral, and on 4 December 1552 he competed unsuccessfully against three other candidates for the post of *maestro de capilla* at Toledo Cathedral; the Palencia cathedral authorities ordered him to give daily music lessons to all cathedral personnel and citizens who wanted to study music in November 1554. On 7 June 1577 the Palencia chapter urged him to care for the choirboys no less zealously than had his brother, and on 30 August 1577 named him a diocesan examiner in 'ecclesiastical music' of all the Palencia clergy. Two months later the chapter decided to engage an assistant, Tomé Cabeza, 'on account of his age and infirmity'. Because of his 'merits and his many years of service, as well as his age and sickness' he was dismissed from his post as *maestro* and awarded a cathedral prebend on 9 April 1578.

Ordóñez's only known works are two *sonetos* printed in Esteban Daza's collection of vihuela music, *El Parnasso* (Valladolid, 1576): *Ay mudo soy hablar non puedo* and *Ay fortuna cruel – Lebantaron muy alto*. The first of these is a lover's lament, the second reproaches Fortune and Cupid.

ROBERT STEVENSON

Ordre (Fr.). A term used by François Couperin (1713–30), François Dagincourt (1733), Philippe Veras (1740) and Coelestin Harst (1745) for a group of pieces in the same key. It is possible that for Couperin *ordre* meant something larger than a suite. In the preface to *Les nations* (1726), a collection of ensemble music, he explained that the *sonades* served as introductions to the suites; the whole complex was called an *ordre*. Four of the *ordres* of his first harpsichord book begin with suites of the late 17th-century type and continue with more up-to-date character-pieces. The later *ordres*, however, do not exhibit this dichotomy, and Couperin's imitators used the term as a synonym for 'suite'. Brossard's dictionary definition of *ordine*, or *ordre*, makes no mention of sets of pieces; however, each suite in G.B. Brevi's *Bizzarie armoniche* (1693) is called an *ordine*.

DAVID FULLER

Ore, Cecilie (*b* Oslo, 19 July 1954). Norwegian composer. A piano student at the Norwegian State Academy of Music and in Paris (1974–81), Ore subsequently turned to composition studies at the Institute of Sonology in Utrecht and with Ton de Leeuw at the Sweelinck Conservatory in Amsterdam (1981–6). In the 1980s Ore won international recognition for several of her electro-acoustic works, receiving an honourable mention at the Concours International de Musique Electro-Acoustique Bourges 1985 for *Im-Mobile*, and both first and second prizes at the International Rostrum for Electro-Acoustic Music 1988 for *Etapper* ('Stages'). In the same year she also received the Norwegian Society of Composers' 'Composition of the Year' award for *Porphyre*, as well as the Norwegian State Guarantee Income for Artists. Towards the end of the decade Ore became increasingly involved with the problem of time in music, an involvement which resulted in the tetralogy *Codex temporis* (*Praesens subitus*, *Erat erit est*, *Futurum exactum*, *Lex temporis*). Another significant landmark is the orchestral work *Nunc et nunc* (1994), commissioned by the BBC SO. Ore frequently uses the computer as a compositional tool, and her music has a distinctly modernistic flavour due to its strict constructivism and austere sonorous universe.

HALLGJERD AKSNES

Orefice [Arefece, Orefici], **Antonio** (*fl* 1708–34). Italian composer. According to most sources he was trained as a lawyer, but his success as a composer suggests he also received expert instruction in music. His opera *Patrò Calienno de la Costa* was the first comic opera in Neapolitan dialect performed on a public stage, at the Fiorentini, Naples, on 1 October 1709. Its popularity led the Fiorentini management to promote further operas of this type, some of which were set by Orefice, and the success of these in turn made dialect comic opera as a genre the established form of popular entertainment at the Fiorentini and some other small theatres in Naples. Only one of Orefice's comic operas, *Il gemino amore* (1718), is without roles in dialect. On 15 October 1724 his *Lo Simmele* was the first opera to be performed at the newly opened Teatro Nuovo in Naples.

Given Orefice's reputation, which can be gauged from the number of operas he wrote, it is surprising that so little of his music remains. His largest surviving work is the first half of *Engelberta*, performed at the Neapolitan royal palace just 34 days after the première of *Patrò Calienno de la Costa*; the closeness of the dates may explain why Orefice did not compose the whole work but only the first half of it (the manuscript score attributes the remainder of the music to Francesco Mancini). Orefice's music in *Engelberta* seems to be modelled on that of leading contemporary Neapolitans, including Alessandro Scarlatti. It compares well with Mancini's contribution from the point of view of technical competence and expressive quality, though Orefice's style is a little less forceful than Mancini's. The other remaining operatic music by Orefice is a group of seven arias from his *Le fente zingare*, the earliest surviving music from any comic opera in Neapolitan dialect (one aria has recently been transcribed and published by Pastore) and an invaluable guide to the development of the musical style adopted by the Neapolitans Vinci and Leo in their dialect operas of the 1720s.

According to Prota-Giurleo and Paduano, Anastasio Orefice, perhaps a son or brother of Antonio, had his own opera *La Limpia* performed in the Teatro Nuovo, Naples, at Carnival 1727; during the same season he was responsible for a revival of Vinci's *Lo cecato fauzo* in the Teatro dei Fiorentini. *La Limpia* was revived as *La zingara* at the Teatro Fiorentini during Carnival 1728. Anastasio also (according to *LaMusicaD*) wrote a comic opera *La Milla o puro Chi è la primmo vence*, performed in Naples in 1726.

MICHAEL F. ROBINSON (with PAOLOGIOVANNI MAIONE)

Orefice, Giacomo (*b* Vicenza, 27 Aug 1865; *d* Milan, 22 Dec 1922). Italian composer and critic. He studied composition with Mancinelli and the piano with Busi at the Liceo Musicale in Bologna, graduating in 1885, presenting the short opera *L'oasi* as his final exercise. He was at first active as a pianist, mostly as a performer of his own works, but from the late 1890s he turned increasingly to opera. In 1896 he was placed third in the Steiner competition in Vienna with the one-act *Il gladiatore*, and in 1898 his *Sinfonia del bosco* was awarded a prize at the Turin Exhibition, where it was conducted by Toscanini. In 1901 his next opera, *Chopin*, loosely based on Chopin's life and through-composed with quotations from his works, met with the audience's approval at the Teatro Lirico in Milan, despite the conflicting opinions of critics; it was revived in Warsaw (1904) and Paris (1905). In 1905 his most highly regarded opera, *Mosè*, was performed successfully in Genoa, and in 1908 his ballet *La soubrette* was awarded a prize of the Société Musicale in Paris.

From 1909 until his death Orefice taught composition at the Milan Conservatory, where Nino Rota, Victor de Sabata and Lodovico Rocca were among his pupils. Meanwhile he was active as a lecturer and as a music critic, mostly for the *Rivista musicale italiana* and from 1920 for *Il secolo* (Milan). In this capacity, and as president of the Società degli Amici della Musica, which he founded in Milan in 1902, he played an active part in the city's musical life. A cultured musician of broad interests, he emphasized in his writings the necessity of introducing greater historical awareness into technical and practical studies in the conservatory, and of bringing music to a wider public. He criticized certain provincial attitudes of Italy's musical life at the time, inviting composers to go beyond mere imitation of foreigners and to rediscover the deeper roots of their own musical tradition. In this respect his transcriptions of Monteverdi's *Orfeo* (Milan, 1909) and Rameau's *Platée*, though philologically inaccurate, are of interest.

As an opera composer Orefice was stylistically eclectic: the strength of his dramatic technique, though rather static and conventional, lies in its effective orchestral images and the expressive qualities of the vocal lines, deliberately simple and sometimes archaic (as in *Mosè*). His choice of subjects was influenced by the veristic and historicizing tendencies of late 19th-century Italian theatre and literature (manifested in his vivid historical settings of the dramas of Pietro Cossa); later, in his most mature and refined works, *Il pane altrui* and *Radda*, he turned to the social realism of Turgenev and Gorky. His most famous opera, *Chopin*, was a case apart whose subject was inspired on the one hand by the cliché of the 'artist's life' popular with the Italian Scapigliatura, and on the other by Orefice's personal ideas about the importance of native and folk roots in musical inspiration.

His symphonic works present a skilful but rather light descriptivism (*Sinfonia del bosco*, *Laudi francescane*). His chamber compositions are more interesting, characterized by an austere sense of form and a noble and refined musical invention (for example, the piano quintet *Riflessi ed ombre*). In the series of short piano pieces (in particular in *Quadri di Boecklin*, *Miraggi* and *Preludi del mare*) his taste for arabesque, his colouristic use of harmony and his search for new sonorities is close to Impressionism.

ANDREA LANZA

Orejón y Aparicio, José de (*b* Huacho, 1706; *d* Lima, between 7 and 21 May 1765). Peruvian composer and organist. The son of Esteban de Orejón and Victoria de Aparicio y Velasco, he showed such precocity that at the

age of nine he was considered suitable to succeed an adult singer at Lima Cathedral who had died. On 2 December 1715 the Archbishop of Lima fixed his yearly salary until he 'lost his voice' at 100 pesos. In 1724 Orejón was still on the cathedral payroll, but as a 'contraalto' instead of a 'tiple'. Probably Orejón studied with Tomás de Torrejón y Velasco, the Spanish-born director of music at Lima Cathedral, who was in office until 1728; he studied the organ with Juan de Peralta, the Lima Cathedral chief organist who died in 1725. But for his youth, Orejón might have been Peralta's successor; he served briefly as 'interim' organist, but the assistant organist Joseph de la Madre de Dios was appointed.

In 1728 Roque Ceruti, a native of Milan who had spent two decades in Peru, became *maestro de capilla* at Lima; an admirer of Corelli and contemporary Italians, Ceruti freshened the cathedral repertory with his brilliant violinistic music and imposed Italian taste on the younger cathedral personnel. In 1730 Orejón applied for an appointment outside Lima Cathedral, as *sacristán mayor* of the church at nearby Pisco, for which he was now eligible as he had just been ordained to the priesthood; but he was unsuccessful. However, the post of chief organist at Lima fell vacant in 1742 and no one ventured to compete with Orejón 'because of his known superior ability'; the chapter tested him alone and on 9 October declared him elected. In response to his applications for salary increases, his starting salary of 500 pesos was raised to 550 in 1745 and to 630 'with the archbishop's consent' in 1754. The cathedral canons particularly praised him for 'his punctuality and for the great amount of work' involved in playing cathedral services twice daily, morning and evening. In that same year his name appears for the first time prefaced with *licenciado*, indicating that he had received the licentiate degree from the University of S Marcos at Lima.

On Ceruti's death, Orejón was nominated *maestro de capilla* on 8 December 1760, while continuing as organist; shortage of funds because of rebuilding after the 1746 earthquake delayed his titular appointment (involving higher salary) until 9 April 1764. He did not live long to enjoy the fruits: he dictated his will on 24 September 1764 from the infirmary of the S Francisco monastery, but was unable to sign it 'because of the severity of his accident'. The organist position was declared vacant 'on account of the death of the licentiate Don Joseph de Aparicio' on 21 May 1765.

His unprecedented talent gained him acclaim in print as early as 1736 (in P.J. Bermúdez de la Torre's *Triunfos del Santo Oficio*) and such favour from an archbishop as no previous cathedral organist had enjoyed; and after his death praise continued to be lavished on him. The *Mercurio peruano* of 16 February 1792 contained Toribio del Campo y Pando's tribute:

> My beloved Aparicio came back to the path from which Ceruti had strayed when he again emphasized melodic line. He exceeded all others, particularly in church music. Several of his hymns are still sung, various masses, psalms, and a canticle to the Sacrament beginning, 'I adore Thee, Mystery Incomprehensible'. Until we heard the works of Terradellas and the immortal Pergolesi, none could compare with Aparicio.

That judgment can be verified by the study of his surviving works in the Lima archiepiscopal archive (subject to depredations in the late 1900s). The most ambitious is a Good Friday Passion composed for triple chorus with orchestra in 1750 (arranged for double chorus in 1810 by Melchor Tapia, cathedral organist). Among the other 18 extant items is a tenderly elegiac solo cantata 'al SS Sacramento' in E minor which, though not beginning with the same words as the *cántico* mentioned in the *Mercurio peruano* eulogy, displays as rare a melodic gift as any item in the Latin American colonial repertory. In the normal Baroque manner, it begins with a recitative accompanied by continuo, but then follows a grand da capo aria during which two violins weave in as moving a discourse against the solo voice as the violins in the 'Et misericordia' of Bach's *Magnificat*. Such works as this, or as his Copacabana duo *A del dia*, or his sacrament duos *Enigma divino* and *Gilguerillo sonoro*, bespeak the unique gifts that kept his music in the repertory for a half-century after his death.

Though in his lifetime his music seems not to have circulated in Spain, it was known and sung at least as far away as Sucre (Bolivia): in the archive of La Plata Cathedral (music now transferred to Archivo Nacional at Sucre) there survived as late as 1966 several concerted pieces showing how frequently his poignant bittersweet, mostly minor-key, music was in demand during the twilight years of the colonial regime.

WORKS

ROBERT STEVENSON

Orel, Alfred (*b* Vienna, 3 July 1889; *d* Vienna, 11 April 1967). Austrian musicologist. After receiving a degree in law at the University of Vienna in 1912 he worked in the Austrian Finance Ministry until 1918. He began studying musicology with Adler in Vienna in 1917 and earned the doctorate in 1919 with a dissertation on the *Salve regina* settings in the Trent manuscripts. From 1918 and 1938 he oversaw the music collection in the Vienna Stadtbibliothek and simultaneously continued to work at the University of Vienna until 1945, completing the *Habilitation* in 1922 with a work on rhythm in 15th-century polyphony; he was named reader in 1929 and supernumerary professor in 1939. Orel was also interim director

of the Staatliche Akademie für Musik und Darstellende Kunst in 1938, and from 1940 to 1945 he was special consultant on Viennese music research for the Vienna office of cultural affairs. After the war he was barred from the university because of his membership in the Nazi party. Orel organized numerous exhibits on music in the 1920s and 30s and received medals of honour from the state in 1928 and 1959 for his services to the city of Vienna. He was also one of the founders and served on the board of directors of the Zentralinstitut für Mozart-Forschung in Salzburg.

Orel's chief interest was Austrian music, particularly Bruckner; his *Anton Bruckner: das Werk, der Künstler, die Zeit* (1925) remains a standard work. He was responsible for the first complete edition of Bruckner's Ninth Symphony, in which he not only restored the cuts omitted in Löwe's 1903 edition and the original orchestration, but also included sketches for the finale. Orel's other important work was on 15th-century polyphony and on composers associated with Vienna, particularly Mozart.

M. ELIZABETH C. BARTLET/PAMELA M. POTTER

Orel, Dobroslav (*b* Ronov, Bohemia, 15 Dec 1870; *d* Prague, 18 Feb 1942). Czech musicologist. A Roman Catholic priest, he taught singing in a seminary in Hradec Králové and contributed to the practical reform of church music with his manual on plainchant (1899) and his numerous articles in *Cyril*, of which he later became editor (1909–19). While in Prague (1907–19) he became a lecturer in liturgical music at the conservatory and at the same time completed his own musical studies under Novák, Hostinský and Bezecný (palaeography) and later with Adler in Vienna, where he obtained the doctorate in 1914 with a dissertation on the *Speciálník* codex of Hradec Králové: publication of an edition (in DTÖ) was prevented by World War I.

In 1919 Orel was appointed to the proposed theological faculty of Bratislava University but when it failed to come into existence he took the chair of musicology instead (1921). Until his retirement in 1938 he held a number of high offices in the university, including that of rector (1931–2). In the new music faculty he trained the first generation of Slovak musicologists and stimulated musical interest in the region: he organized and conducted choral societies; he directed the collection and publication of folk music; he led the search for manuscripts and other musical sources in Slovakia. His own interests broadened to include Slovak music. He is however best remembered for his pioneering work on early Czech polyphony and hymnology, such as his book on the St Wenceslas tradition

in music, which clarified the sources and development of the earliest Czech sacred songs. He also edited several hymnbooks, including *Český kancionál* [A Czech hymnbook] (Prague, 1921, 5/1936).

JOHN TYRRELL

Orellana Castro, Andrés Gilberto (*b* Santa Ana, 12 Dec 1938). Salvadoran composer and violinist. He began his musical studies with his father, the composer Gilberto Orellana, then studied at the National Conservatory and with John Donald Robb at the University of New Mexico, where he received an MA in composition. He was a violinist in the Salvadoran national orchestra (1960–66) and later was its conductor (1974–85); he has also been appointed conductor of the San Salvador National Youth Orchestra. He has won several competitions in the United States, Argentina and El Salvador. In his extensive output he has experimented with a variety of compositional approaches: free harmony in the violin and piano duet *Cartas de mis padres* (1971), serial technique in the String Trio (1962), and prepared piano in *Mobile perpetuum* (1973). His works are composed in various formats and include the electronic *Variaciones sobre el tema de 'Fantasía en el bosque'* (1970), *Salmo 150* (1975) for mixed chorus and orchestra, and *Amatepec* (1977) which accompanies dance. His one symphony, *Sinfonía Pipil* (1980), draws on imagined pre-Columbian musical practices and is one of the few works that strive for a nationalist style. Beginning with *Cristo la respuesta* (1982), he has concentrated on religious compositions.

T.M. SCRUGGS

Orellana, I(gnatius) A(ntonio) de (*b* St Helier, Jersey, *c*1860; *d* London, 19 March 1931). British conductor and orchestrator. He conducted and orchestrated many musical theatre scores of the Edwardian era, most particularly *Miss Hook of Holland* and other scores of Paul A. Rubens at the Prince of Wales Theatre. Eric Coates, who performed under him as a deputy, described his 'remarkable sense of theatre' and orchestrations 'delicately finished and always in good taste ... never [interfering] with a composer's harmonic progressions'. His later work included orchestrations for Porter's *Wake Up and Dream* (1929), Coward's *Bitter Sweet* (1929) and Berners's *Luna Park* (1930), and he was also musical director for Fraser-Simson's *Toad of Toad Hall* (1929).

ANDREW LAMB

Orellana M., Joaquín (*b* 5 Nov 1933). Guatemalan composer. He studied at the National Conservatory of Music and was violinist in the National SO for many years. He distinguished himself as an important new composer early in his career. In 1958 *El jardín encantado* was awarded first prize in the annual Central American Science, Letters and Fine Arts Competition. In 1965 his String Trio was commissioned by the Third Inter-American Music Festival and first performed there in Washington, DC. These earlier works were essentially tonal, the String Trio using pan-diatonicism. In the 1970s he began experimenting with *flujos sonoro-sociales*, recombinations on tape of ambient sound peculiar to the sonorous landscape of Guatemala. Two of his first and most successful compositions using this approach are *Electroacústica* and *Imposible a la X: historia en redondo* (1976), both presented in several international forums. An aleatory approach characterizes *Híbrido a presión* (1982) for two flutes, several specially created instruments and magnetic tape. He also investigated the sonorous possibilities of the Guatemalan marimba, considered the national instrument, by constructing new instruments from fragments of the *marimba grande*. These original instruments, which carry such names as *ciclo-im*, *rastra-son* and *pandemarimbas*, reproduce and expand certain aspects of the marimba's timbre, especially its percussive attack. *Tzulumanachí* (1974) features one of these, a *sonarimba*. Especially notable among these works is *Evocación profunda y traslaciones de una marimba* (1984), scored for marimba, narrator, mixed chorus, magnetic tape and several original marimba-derived instruments.

Oresme, Nicole (*b* Normandy, *c*1320; *d* Lisieux, 1382). French philosopher and mathematician. He is recognized as the leading mathematician of his day. He studied at the University of Paris and took the MA in 1356. He served as Grand Master of the College of Navarre in Paris (1356–62) and held a series of ecclesiastical posts leading to his appointment as Bishop of Lisieux in 1377, a post he held until his death. He wrote on a wide range of topics, including theology, physics, magic and economics, frequently drawing from writers such as Plato, Aristotle, Boethius and Cassiodorus.

Nicole Oresme's grid pattern of 'harmonic numbers'

Oresme's observations on music arose from his studies of mathematics and physics. Along with the mathematician GERSONIDES, Oresme expanded Plato's series of 'harmonic numbers' (*Timaeus*, 35ff) to include two endless series of numbers based on multiples of two or three. He developed Gersonides's theory, proposing that all proportions between the two series are 'harmonic ratios', although he acknowledged that only four proportions produce consonant intervals. In his commentary on Aristotle's *De caelo*, written at the request of Charles V of France, Oresme arranged these numbers in a grid pattern (see illustration) and stated that 'this figure is full of very great mysteries and from it we can draw extremely attractive and marvelous conclusions, for it contains virtually the whole formation of speculative music' (*Le livre du ciel et du monde*, ii.18; Menut and Denomy, 478–81). He commented on harmonic numbers in several treatises, including his study of motion *Tractatus de configurationibus qualitatum et motuum* (ii.17) and his *Algorismus proportionum* (iii). Oresme wrote on other philosophical issues related to music, such as whether the movements of heavenly bodies produce sounds (*Le livre du ciel et du monde*, ii.18) and the relationship between sound and magic (*Tractatus de configurationibus*, ii.25). In his commentary on Aristotle's *Politics* (viii.6–14) he set out his ideas of harmonic numbers and expounded on Aristotle's views with quotations from the scriptures, Pythagoras, Boethius and other sources. The term 'harmonic number' is also found in Johannes Boen's *Musica*. Oresme was in contact with the leading musical theorists and mathematicians of his day: he dedicated his *Algorismus proportionum* to Philippe de Vitry and discussed mathematical issues that were also of interest to Johannes de Muris.

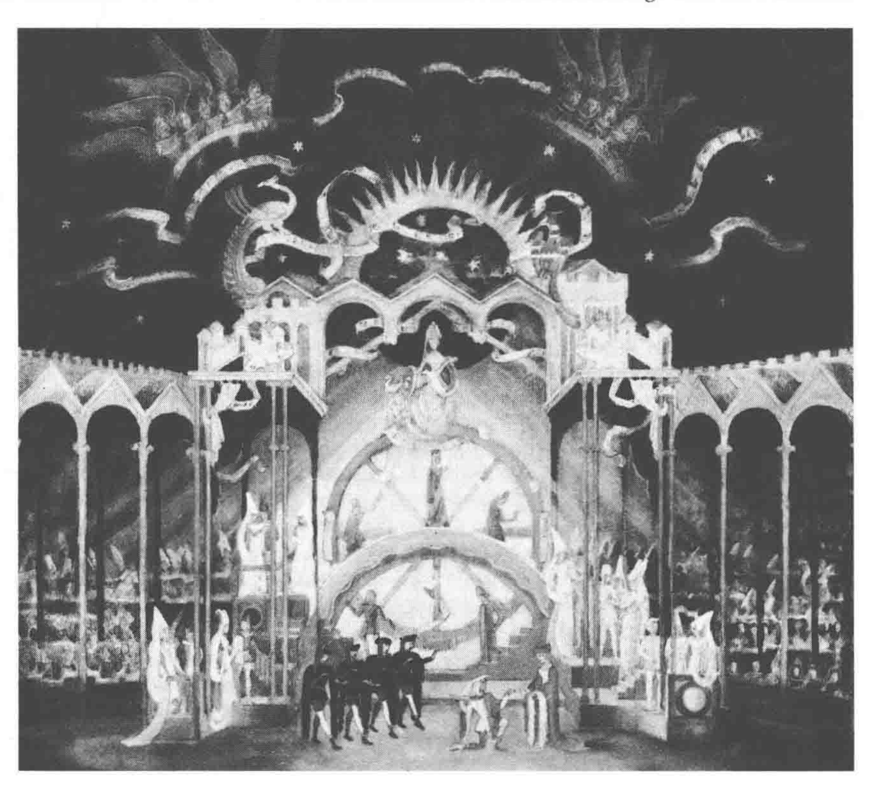
C. MATTHEW BALENSUELA

Orff, Carl (*b* Munich, 10 July 1895; *d* Munich, 29 March 1982). German composer and music educator. Drawing on ancient Greek tragedy and employing models of Baroque *theatrum emblematicum*, he established a musical theatre of impressive force permeated at times by Bavarian peasant life and Christian mystery.

1. Life. 2. Works. 3. *Schulwerk*.

1. LIFE. Orff was born into a family of army officers given to scientific and historical studies, whose members were also great music lovers. He began to study the piano, the organ and the cello at the age of five. In Munich he attended the Ludwigsgymnasium (1905–7) and later the Wittelsbacher Gymnasium (1907–12). Dissatisfied with the teaching of Beer-Walbrunn at the Akademie der Tonkunst (1912–14), he discovered for himself not only the sound world of Debussy, a fascination that is readily apparent in the music drama *Gisei, das Opfer* (1913), but also the musical language of Schoenberg. His activity as Kapellmeister at the Munich Kammerspiele (1917), where he was introduced by his piano teacher Hermann Zilcher, was decisive for his musical development. There he collaborated with the director Otto Falckenberg. The first version of Orff's stage music to *Ein Sommernachtstraum* dates from that year, although the music was never performed. Drafted into the army in 1917, he was wounded at the front, and having been declared unfit for active service, he saw out the rest of the war first at the Nationaltheater in Mannheim and then at the Hoftheater in Darmstadt. On his return to Munich in 1919, he devoted himself to studying the music of the 16th and 17th centuries, especially Monteverdi, to whom Curt Sachs had drawn his attention. Between 1920 and 1921 he continued his studies with Heinrich Kaminski. In 1924 he founded, along with Dorothee Günther, the Güntherschule in Munich, an educational centre for gymnastics, rhythmic movement, music and dance; it was within these surroundings that he developed his concept of *elementare Musik*, a synthesis of gesture, poetic language and music that was later to fertilize his personal musical style and from which his *Schulwerk* would eventually evolve. The first edition of *Orff-Schulwerk: elementare Musikübung*, published in collaboration with Gunild Keetman and Hans Bergese, appeared during the period 1932–5.



Orff's realizations of a number of Monteverdi scores, beginning with *Orpheus* (first version, 1923–4, to a German text by Dorothee Günther), were of pioneering

significance. Between 1932 and 1933, he directed the Munich Bachverein, a concert society for which he staged Schütz's *Auferstehungshistoria* (1933) and conducted several concerts. With the advent of National Socialism, he resigned from his post as director of the Bachverein. His first success as a composer, albeit not an unqualified one, came with the première of *Carmina Burana* in Frankfurt on 8 June 1937. After the war Orff, along with his publisher, was accused of having exerted too great an effort in promoting his works under Hitler's dictatorship. Particularly controversial was the first performance in Frankfurt (1939) of the third version of the incidental music to *Ein Sommernachtstraum*. Against the background of the racial discrimination exercised by the Nazis towards Mendelssohn's works, the composer may indeed have 'overestimate[d] the scope of musical autonomy in a state committed to a particular Weltanschauung' (Maier, 9). However, Orff was not a member of the party at any time and entertained towards it no feelings of ideological sympathy. Nor were there among his closest friends any supporters of the Nazi regime's ideology. The fact that *Carmina Burana* had been torn to shreds by Herbert Gerigk, the influential critic of the *Völkischer Beobachter*, who referred to the 'incomprehensibility of the language' coloured by a 'jazzy atmosphere', caused many of Germany's opera Intendanten to fear staging the work after its première.

From 1950 to 1960 Orff held a chair of composition at the Hochschule für Musik in Munich. In 1956 he became a member of the order *Pour le mérite* for science and art; he received an honorary doctorate from the University of Tübingen in 1959, and in 1972 a second from the University of Munich; that year he was also awarded the Grosses Verdienstkreuz der Bundesrepublik Deutschland, while in 1974 the Katholische Akademie of Bavaria bestowed on him the Guardini Prize. During the period 1972–81 he was occupied with his eight-volume publication *Carl Orff und sein Werk: Dokumentation* (Tutzing, 1975–83).

2. WORKS. The first significant compositions by the young Orff were settings for voice and piano of texts by, among others, Friedrich Hölderlin, Heinrich Heine, Ludwig Uhland, Nikolaus Lenau, Richard Beer-Hofmann, Friedrich Nietzsche and Karl Stieler. But his first music to be published was the cycle *Eliland, ein Sang vom Chiemsee* (1911). Around the beginning of the 1980s Orff selected 14 of the early songs, including seven Werfel poems dating from 1920–21, for a collection that appeared as *Frühe Lieder*. This song sequence shows the composer distancing himself from late Romanticism and the Straussian tradition as well as the almost seductive language of Debussy, both of which had informed the orchestral tone poem *Tanzende Faune* (1914) and the *Treibhauslieder* (to texts by Maeterlinck). In the Werfel settings and the cantata *Des Turmes Auferstehung* (1920, rev. 1921, also to a Werfel text), some of the traits that were to characterize his mature style are already evident: a diatonic and linear approach, tectonic construction, and employment of drones and ostinatos, as well as the central role of the word, the fundamental element in that matrix of musical gestures which subsequently found expression in an order of theatricality freed from the subjectivity of late Romanticism.

Orff's development in the 1920s took two main paths: his experience gathered at the Güntherschule (see §3 below), and his exploration of Renaissance and Baroque music. His interest in antiquity and classical languages did not arise out of the contemporary penchant for neoclassicism: this hypothesis, still maintained by some, has created numerous misunderstandings that have affected

1. Design by Ludwig Sievert for the first performance of Orff's 'Carmina Burana', Frankfurt, 1937 (Institut für Theaterwissenschaft, University of Cologne)

the historical reception of Orff's works. It should be recognized that Orff's return to ancient sources, his 'Abstieg zu den Müttern' as he described it, was imbued with humanistic fervour and an untainted fascination with the word as both the vehicle of and the key to all theatrical experience. Such a recognition relativizes the difficulties encountered when considering his revitalization of musical language as an 'absolute' means of expression.

The most notable product of Orff's free transcriptions is his *Orpheus*, *Klage der Ariadne* and *Tanz der Spröden*, reworked Monteverdi scores which in 1958 he grouped into the triptych *Lamenti*, and the *Entrata* after Byrd (1928, rev. 1940). It was this artistic activity that enabled him to broaden his search for a personal theatrical mode of expression. Also of great relevance in this respect were his dramatic realizations of Baroque oratorios. Along with Schütz's *Auferstehungshistoria*, Orff staged the *Lukaspassion*, a work formerly attributed to J.S. Bach (BWV246), for the Vereinigung für zeitgenössische Musik in 1932. That performance was accompanied by slide projections of 15th-century Tyrolean woodcuts, creating an imaginative expansion of both visual and musical space, and anticipating the 'imagines magicae' that were to accompany *Carmina Burana*. By exploiting his compositional experience accumulated thus far, Orff managed to write two cycles of choral pieces accompanied by piano and percussion. For the first cycle he drew once again on seven Werfel Lieder, as well as other texts; the second cycle is to words by Brecht. Here, Orff was able to experiment with pointillist effects by combining percussion instruments, and to further perfect a compositional technique based on stratified diatonic modes supported by drones and ostinatos.

His discovery during this period of the Latin language and poems by Catullus marked a caesura in his output. For Orff this was the beginning of an exploration of classical antiquity that subsequently led him back to the very roots of European culture. The graceful suppleness of the melodic lines in the two unaccompanied cycles *Catulli Carmina* I and II (1930–31) is the most tangible result of this experience. The way was paved to the theatrical genre and those *Carmina Burana* songs that Orff considered the point of departure for his mature dramatic and musical style. The 23 poems, in part chosen by Orff under the philological tutelage of Michel Hofmann from the late medieval goliardic repertory in the famous Benediktbeuern manuscript, bring to life a number of allegorical tableaux; their static quality relates back, as Werner Thomas has argued (1990, pp.113–35) to a late Renaissance and Baroque conception that has its correlate in the stasis of the musical structures, which are based on strophic form, the ostinato and the drone. The harmonic idiom used by Orff just manages to elude pure tonality by suspending its gravitational pull through the use of a proto-harmonic language tinged with modal procedures. With its concise style and rhythmic pregnancy, the music liberates the latent power of the texts to create their own images and comment on the *imagines magicae* being staged under the unsettling aegis of the goddess Fortuna. Orff's own research into the area of Bavarian folksong, carried out with Kurt Huber, manifests itself in the form of alternating duple and triple dance rhythms modelled on the *Zwiefacher* and finds a place not only in this work but also in *Der Mond*.

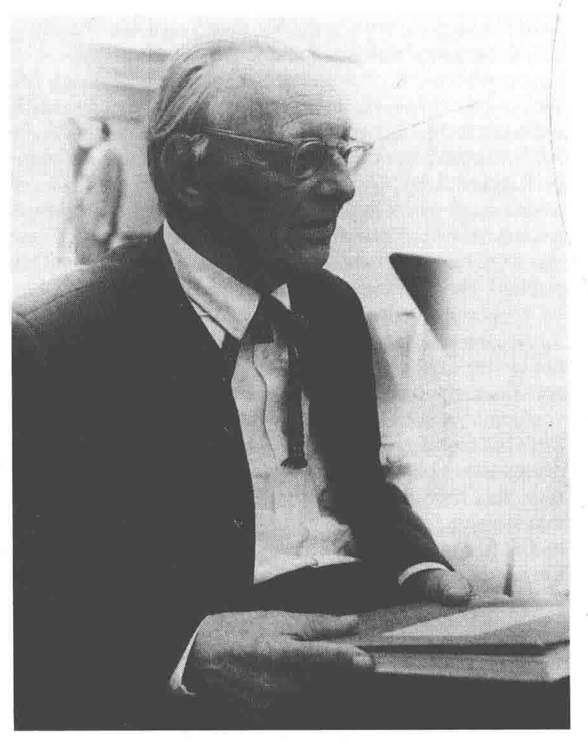
In 1953 Orff grouped *Carmina Burana*, *Catulli Carmina* (1941–3) and *Trionfo di Afrodite* (1949–51) into the triptych *Trionfi*. In *Catulli Carmina* he lends 11 poems by Catullus (including six earlier *a cappella* choruses) a musical and dramatic dimension. This unfolds within a scene which, in its reliance on a *Rahmenspiel* used to frame the action and devised by Orff himself to his own words, and the use of various groups of people acting the part of spectators, acquires in performance those emblematic qualities that had already characterized *Carmina Burana*. The work is a parable of the power of Eros; above is the stage on which the dancers move, whereas the choir and the solo singers are placed in the orchestra pit. The actual songs of the *Catulli Carmina* are performed *a cappella*, as if they were a *commedia madrigalesca* or some sort of play within a play. Furthermore, this *Rahmenspiel* is scored for percussion instruments and four pianos, heralding future explorations of the timbral possibilities of percussion instruments that would lead Orff to abandon the traditional orchestra.

In the *Trionfo di Afrodite*, the last panel of the triptych, the ecstatic and melismatic parts of the bride and bridegroom already exhibit signs of the style employed in *Antigonae*. Here, Orff makes use of the ancient Greek language for the first time. To texts by Sappho and Catullus (*Epithalamia* lxi and lxii) he evokes the atmosphere of an archaic wedding ceremony that culminates with the appearance of Aphrodite (verses 1268–81 of *Hippolytus* by Euripides). Such a manifestation of divinity is achieved by a chromatic filling out of the musical space, a procedure that marks the most complete distancing from the diatonic background and which Orff later adopted in the chordal agglomerates of the Tiresias episode in *Oedipus* (Zillig, 207).

With *Der Mond* and *Die Kluge* Orff made a most original contribution to the genre of fairy tale opera. In *Der Mond* (1936–8), designated 'ein kleines Welttheater', the reference to the enormous multi-dimensionality of the Baroque theatre is evident. The story unravels on three levels: the level of human action, that of the underworld, and that of the heavens. It is out of this final plane that Petrus, the guardian of the night and the heavens, descends at the end of the work to restore the moon to its properly assigned place above the earth. This subject, which originates in the mythical interpretation of the phenomenon of the phases of the moon, is based on the fable of the same name by the Grimm brothers. Orff traces this story back to its pre-Christian origins, wholly evident in the finale. Petrus is no longer the St Peter of the Grimms, but rather a wise, good-natured custodian of order in the world. In Orff's setting the story unfolds through the voice of a narrator, and the scene acquires epic and evocative characteristics. Orff's allusion to the Evangelist of the Baroque oratorio is clear: the formal structure is that of a Singspiel, its music bestowing occasionally a knowing wink at 19th-century operatic convention and exhibiting the immediacy of popular songs and dance tunes (as, for example, in the 'Totenbacchanal' scene). Orff considered the orchestra of *Der Mond* as his 'last Romantic orchestra', perhaps because of the magical tonal colours of the finale. It is not only the transparency of the score but also the fairy tale stylization of the characters that are novel, placing the work firmly in the domain of 20th century sensibility.

For his second fairy tale opera, *Die Kluge: die Geschichte von dem König und der klugen Frau* (1941–2), Orff drew on a fable common to countless cultures of East and West, taking as his starting point a version by the Cabila people as recorded by Leo Frobenius (*Atlantis*, 1921–8). The tale centres on the wisdom of a peasant girl who is married to the King after solving three riddles, then helps her husband achieve a fuller understanding of himself and the world. The multi-dimensionality evinced in Orff's 'Welttheater', that of *Der Mond*, here contrasts with the centrality of humankind and its role in fable. The action takes place on two planes. The decision to introduce a subplot acted out by three mechanicals to accompany the main story is evidence of a Shakespearean influence in a theatrical sense, these *Strolche* ('vagabonds') wholly characteristic of Orff's own idea of theatre. The treatment of the orchestra is characterized by an indulgence in harsh tonal colours far removed from any Romantic sound ideal. In terms of compositional techniques, here as elsewhere, the repetition of rhythmically incisive, brief melodic cells in increasingly abbreviated forms is significant, exemplified in the peasant lament with which the work opens.

From the 1940s onwards Orff delved increasingly into classical antiquity. The trilogy that he began with *Antigonae* (1941–9) resulted both in means and intention in his most radical contribution to modern music theatre, a salient moment in the 20th century's attempts to harness ancient Attic tragedy. *Antigonae* itself marks a second turning point in Orff's development, for it coincides with the implementation of an idea that had flashed through his mind in 1914. While listening to Strauss's *Elektra* in a performance conducted by the composer, Orff became aware that this opera marked the end of a musical era and of a particular way of dealing with antiquity. In Hölderlin's version of *Antigonae* he recognized a basis that could be used to restore to theatre a cultic status and would make it possible to reclaim the tragedies of Sophocles for the music theatre of his own times. As Stefan Kunze wrote (1985–90, p.201), according to Orff 'the Antique is not a means to devise new forms of musical expression', to 'serve the composition', but rather one by which 'to appropriate antique tragedy as a real theatrical event'. To this corresponds the development of a singing style that takes as its starting point recitative in the manner of psalmody, the use of brittle, incisive instrumental sounds entrusted to six pianos, and a large battery of percussion, as well as choirs of wind instruments and nine double basses.



Hölderlin's 'Hesperic' translation acts as a mediator, allowing us to glimpse the sacral nature of the Sophocles text: the 'Sphinx-like rigidity' of the ancient Greek is transformed into the 'glowing magma' that is 'Western language' (Georgiades, 192). This is counterbalanced by a strict musical stylization in which recitative on the *recto tono* builds up to the high pathos of Creon's melismas and to ecstatic levels in the chromatic declamation of Tiresias. At the end of a long development, Orff's style still admits a harmonic idiom that Wilhelm Keller (p.43) calls 'personantisch', by which he means 'the simultaneous sounding of different elements within a clearly defined tonal field of reference'. In *Antigonae*, and in later tragedies too, the spoken word plays a central role. Out of the word are generated the rhythmic pulse and melodic line, while the orchestra sustains the declamation of the singers and, in erecting large, static blocks of sound, mirrors the architectonics of the tragedy. In his next work, *Oedipus der Tyrann* (1951–8), also based on a Hölderlin text, the word again becomes the pivot around which the musical drama is constructed, given the dialectic nature of a drama in which, according to Hölderlin, 'the spoken word set against the spoken word is everything'. A highly graduated range of expressive nuances combines in various ways with the percussion instruments to produce new timbres. The central role of the Oedipus figure corresponds musically to a strictly uniform distribution of tonal areas.

In *Prometheus desmotes* (1963–7) it is the scene of the tragedy that becomes the world itself. And if in the 'Osterspiel' and 'Weihnachtsspiel' (i.e. the diptych *Comoedia de Christi resurrectione* and the *Ludus de nato Infante mirificus* which, together with *Die Bernauerin* and *Astutuli*, make up the 'Bairisches Welttheater') Orff had already attached to ancient Greek a weighty symbolic significance, the decision to resort to the original language in the case of *Prometheus* was fraught with problems. Orff applied to the quantitative scanning of the verse the same 'musico-gestural speech ductus' (*Dokumentation*, viii, 1985, p.10) that he had used in the previous tragedies, opting for a free declamatory rhythm. Orff's theatre rejects any historicizing approach. It is the intention of the composer that the eloquence of the images and the preponderance of the visible – characteristics that *Prometheus* makes its own – compensate for the loss of a semantic dimension. By demanding an exotic array of percussion that calls for 15 to 18 players, the orchestra ensures that many world cultures are represented. And by incorporating cluster techniques and magnetic tape (Orff approaching, in this regard at least, the avant garde) the composer manages to evoke the archaic and cultic significance of this ancient myth.

In the four works comprising the 'Bairisches Welttheater' the entire theatrical experience relies once again on the spoken word. A tragic dimension seeps through *Die Bernauerin* (1944–6). It tells the story of a young Augsburg girl who, in 1432, is secretly married to the Duke, Albrecht III, before falling victim to a political conspiracy instigated by Albrecht's father. By distancing himself from the work of the same name by Hebbel and following the example of Schmeller's *Bayerisches Wörterbuch* (1827–37) and the 15th-century *Liederbuch der Clara Hätzlerin*, Orff pointed up the musicality of even the most recondite forms of the ancient Bavarian language. Brief passages of music are inserted and frame the spoken parts. Earthly events are driven by higher powers of which the witches constitute the demonic aspect. And it is only in the finale – where the action, thanks to the intervention of these invisible forces, receives a cathartic urge that pushes the drama into the sphere of tragedy and of mystery plays – that the orchestra supports the declamation without interruption. In *Astutuli* (1946–8), the satyr-like sibling of *Die Bernauerin*, Orff retraces his steps to the origins of European theatre, treading the bare boards on which the Roman comedian, or *joculator*, used to perform. The action is punctuated only by percussion instruments; the Bavarian language brims with images and mimetic power; and the only musical number in the traditional sense is the final 'Dreher' of the unrepentant and gullible fools, who were cheated and robbed by the *Gagler*, or itinerant confidence tricksters: 'mundus vult decipi'.

The gestation of *De temporum fine comoedia*, which is the epitome of Orff's theatrical work, began while he was working on *Prometheus*. The score to this 'Spiel vom Ende der Zeiten' was completed between 1970 and 1971, with texts taken from the *Oracula sibyllina*, an Orphic Hymn to Oneiros, and also from the *Carmina Burana* collection. Orff lends to a theological idea a theatrical form that was already present in *Des Turmes Auferstehung*: Origene's 'apokatástasis pánton', namely the idea that the world returns to God with the consequence that all guilt is temporally finite. The vastness of this eschatological scenario feeds the visionary quality of this modern mystery play. And in the vision invoked by the Anachoretes one participates in the repentance of Lucifer, announced symbolically in the music by open 5ths to a blare of trumpets. There follows a transfiguring dematerialization of all musical parameters, then a canon for four viols. This symbolic mandala representing 'Tà pánta Noûs' ('Everything is Spirit') and closing with a reference to Anaxagoras, signifies both the end of the *comoedia* and of Orff's creative career.

3. 'SCHULWERK'. The birth of the Güntherschule must be viewed against the historical backdrop of the *Neue Tanzbewegung* of the first few decades of the 20th century. This anti-academic movement was personified in Germany by Rudolf von Laban and Mary Wigman, both exponents of the so-called 'Ausdruckstanz', or expressive dance. In *Über das Geistige in der Kunst* (1912), Wassily Kandinsky had already written that future dance forms would arise whose expression would rely on the internalization of movement. Indeed, the very notion of the *elementare* (elemental), as applied by Orff to music and to verbal and bodily expression, evokes the kind of dissection of the figurative universe into its primary elements that Kandinsky had already theorized. Orff and Dorothee Günther intended to obviate the absence of adequate elemental music in the dance schools of, among others, Dalcroze and Bode by searching for a music that 'begins in movement'. Of decisive importance was the work of Maja Lex at the Güntherschule from 1925 onwards. She managed to devise an elemental dance style that was free from the influence of Wigman's expressionism. Starting in 1930, Maja Lex guided the dance group of the Güntherschule to national and international success. Only after 1948, as the *Schulwerk* spread through broadcasts by Bavarian Radio, was full attention also paid to the relationship between sound and word, whereby rhythm remained the fundamental kinetic element behind the improvisation process. The first volume of *Musik für Kinder* (1950–54, 5 vols.) takes as its starting point the simplest possible poetic material, such as children's rhymes and singing games, all rich in mimetic and gestural elements. The 20 editions of the *Schulwerk*, issued from the 1950s onwards, include editions in many different languages, including African languages and Japanese, each of which draws for inspiration on the musical and literary cultural heritage of the culture in question.

2. *Carl Orff*

In creating a body of suitable instruments, especially percussion and recorders, a vital role was played by Gunild Keetman (1904–90), Orff's *alter ego* where his experimentation with new teaching methods was concerned. The highly differentiated and novel use of percussion instruments – true of course for all of Orff's work – must be considered within the historical perspective of their emancipation during the 20th century. Also noteworthy in this respect was the contribution made by two instrument makers: Karl Maendler before World War II, and after 1945, Klaus Becker, the founder of Studio 49. It was in 1949 that the *Schulwerk* arrived at the Mozarteum, where, in 1961, the Orff-Institut was inaugurated. From the 1950s onwards the approach began to spread around the world.

Improvisation techniques represent the essence of all experimentation; they were the pivotal idea of the *Schulwerk* during the very early years, and before the introduction of the now obselete ideological constructs with which theoreticians in the 1930s sought to underpin the activities of the Güntherschule. Alien to all rigid methodology, the *Schulwerk* aims to support creativity in the child. This is effected by the assimilation, always on the basis of elemental, easily grasped structures, of the traditional musical forms that have arisen throughout history. Theoretical debate over the last few decades has pointed up the difficulties of arriving at a satisfactory definition of the elemental, while simultaneously demonstrating the term's precarious and ephemeral philosophical quality. The concept of the elemental preserves a certain utility if one recognizes the historical origin of the models and the cultural preconditions of 'elementare Musik', irrespective of the traditions to which it refers. It is necessary to identify in the elemental structures not an original essence, but rather the expression of a 'second-order naturalness', one filtered by historical experience. Indeed, as Orff and Keetman worked on the progressive enlargement of the melodic range of the models and the internal ordering of the five volumes of *Musik für Kinder*, which cover all the major modes (books 2 and 3) and all minor ones (books 4 and 5) in the sequence *Bordun–Stufen–Dominanten*, he studiously avoided an evolutionary portrayal of the history of music.

The efficacy of the concept of elemental music presupposes a dimension of craftsmanship which has aesthetic autonomy and requires no simplification of complex artistic means of expression. Nonetheless, at the time the first edition appeared the models used in the *Schulwerk* were already being misunderstood as musical 'texts' rather than cues for improvisation. The difficulty of applying in a creative manner the methodological suggestions of Orff and his colleagues has not prevented the *Schulwerk* from demonstrating its incredible vitality and powers of regeneration within ever-changing social and cultural environments, a vigour that is also confirmed by the application of this approach with handicapped children and in the field of music therapy.

WORKS

STAGE

Gisei, das Opfer (music drama, after Jap. drama: *Terakoya*, trans. K. Florenz), 1913
Ein Sommernachtstraum (after W. Shakespeare, trans. A.W. Schlegel), 1917–62, final version, Stuttgart, 12 March 1964
Klage der Ariadne (after O. Rinuccini, Ger. trans. Orff), Mannheim, 16 April 1925, rev. Gera, 30 Nov 1940 [after C. Monteverdi]
Orpheus (3, after A. Striggio, Ger. trans. D. Günther), 1923–4, Mannheim, 17 April 1925; rev. Munich, 13 Oct 1929; rev. Dresden, 4 Oct 1940 [after Monteverdi]
Tanz der Spröden (Rinuccini, Ger. trans. Günther), Karlsruhe, 28 Dec 1925, rev. Gera, 30 Nov 1940 [after Monteverdi]
Carmina Burana (cantiones profanae, 3 scenes, medieval Lat.), 1936, Frankfurt, 8 June 1937
Der Mond (kleines Welttheater, 1, Orff, after J.L. and W.C. Grimm), 1936–8, Munich, 5 Feb 1939, rev. 1970
Antigonae (Trauerspiel, 5, Sophocles, trans. F. Hölderlin), 1941–9, Salzburg, 9 Aug 1949
Catulli Carmina (ludi scaenici, 3 acts and Exordium, Orff, after Catullus), 1941–3, Leipzig, 6 Nov 1943
Die Kluge: die Geschichte von dem König und der klugen Frau (12 scenes, Orff, after J.L. and W.C. Grimm), 1941–2, Frankfurt, 20 Feb 1943
Die Bernauerin (bairisches Stück, 7 scenes, Orff), 1944–6, Stuttgart, 15 June 1947
Astutuli (bairische Komödie, 1, Orff), 1946–8, Munich, 20 Oct 1953
Trionfo di Afrodite (concerto scenico, 7 scenes, Catullus, Sappho and Euripides), 1949–51, Milan, 13 Feb 1953
Oedipus der Tyrann (Trauerspiel, Sophocles, trans. Hölderlin), 1951–8, Stuttgart, 11 Dec 1959
Trionfi (trittico teatrale), Milan, 13 Feb 1953 [consisting of Carmina burana, Catulli carmina, Trionfo di Afrodite]
Comoedia de Christi resurrectione (Osterspiel, Orff), 1955, TV perf., Bayerischer Rundfunk, Munich, 31 March 1956, staged, Stuttgart, 21 April 1957
Lamenti (trittico teatrale), Schwetzingen, 15 May 1958 [consisting of Klage der Ariadne, Orpheus, Tanz der Spröden]
Ludus de nato Infante mirificus (Weihnachtsspiel, Orff), 1960, Stuttgart, 11 Dec 1960
Prometheus desmotes (1, Orff, after Aeschylus), 1963–7, Stuttgart, 24 March 1968
De temporum fine comoedia (Bühnenspiel, 3 pts, Orff), 1970–71, Salzburg, 20 Aug 1973, rev. 1979, final version, 1981, Ulm, 15 May 1994

OTHER WORKS

Vocal: Lieder (various), 1v, pf, 1911–21; Zarathustra, Bar, male vv, orch, 1911–12; 3 Lieder (R. Dehmel), T, orch, 1918–19; Des Turmes Auferstehung (cant., F. Werfel), 2 Bar, orch, org, 1920 [rev. male vv, orch, org, 1921]; Cantata (Werkbuch I) (Werfel), chorus, pf, perc, 1930–32, rev. 1968; Cantata (Werkbuch II) (B. Brecht), chorus, pf, perc, 1930–31, rev. 1968–73; Catulli Carmina I, 1930; Catulli Carmina II, 1931; Concento di voci, chorus, 1931–56: Sirmio; Laudes creatorum; Sunt lacrimae rerum; Cantus-Firmus Sätze, 2–4vv, opt. insts, 1932, rev. 1954 [from *Orff-Schulwerk*]; Dithyrambi (F. Schiller), chorus, insts, 1955–6, rev. 1981; Stücke, speaking chorus, 1969; Rota, chorus, insts, 1972 [after Sumer is icumen in]; Sprechstücke, spkr, speaking chorus, perc, 1976
Inst: Tanzende Faune, orch, 1914; Leonce und Lena (incid music, G. Büchner), orch, 1919; Kleines Konzert, wind, hpd, perc, 1927, rev. orch, 1937 [based on 16th-century themes]; Entrata, orch, org, 1928, rev. 1940 [after Byrd: The Bells]
Collections: Orff-Schulwerk: elementare Musikübung (Mainz, 1931–4), collab. G. Keetman; Musik für Kinder, 5 vols. (Mainz, 1950–54), collab. Keetman

Principal publisher: Schott

ALBERTO FASSONE

Orford Quartet. Canadian string quartet. It was formed in 1965 at the summer school of Les Jeunesses Musicales de Québec at Mount Orford by Andrew Dawes (*b* High River, AB, 7 Feb 1940), Kenneth Perkins, Terence Helmer and Marcel St-Cyr. The four were coached by Lorand Fenyves of the University of Toronto, former leader of

the Orchestre de la Suisse Romande, with whom Dawes and Perkins had studied in Geneva. In 1968 the ensemble was given a residency at the university. Regarded as the leading quartet in Canada, it toured extensively in Europe and North America, playing the Classical and Romantic repertory as well as such contemporary works as those of George Crumb and Leon Kirchner. In 1972 it gave the première of Jacques Hetu's Quartet and in November 1974 it shared first prize in the EBU competition in Stockholm. In 1980 Denis Brott took over the cello chair and this formation of the quartet recorded a celebrated Beethoven cycle. Robert Levine became the viola player in 1986, to be succeeded the following year by Sophie Renshaw, and Desmond Hoebig replaced Brott in 1988. The ensemble was dissolved in 1992 but in 1995–6 Dawes made a comeback to fill in as leader of the Tokyo Quartet.

TULLY POTTER

Orgad, Ben-Zion (*b* Gelsenkirchen, 21 Aug 1926). Israeli composer and teacher of German origin. In 1933 he moved to Palestine, where he studied the violin with P. Kimari (1934–42) and R. Bergman (1942–7), and composition with Ben-Haim (1941–6) and Tal, graduating from the Rubin Academy of Music, Jerusalem, in 1947. He went to the USA in 1949 to study with Copland at Tanglewood and to attend Kurt Sachs's lectures at New York University. In 1950 his symphony *Ha-sui Yisra'el* ('The Beauty of Israel') was introduced by the Israel PO under Bernstein, and in 1950 his biblical cantata *Sipur ha-meraglim* ('The Story of the Spies') won him the International Koussevitzky Competition, enabling him to continue his studies at Tanglewood, where the work was first performed in 1952. He also studied under Fine, Shapero and Levi at Brandeis University (1960–61), receiving the MFA in musicology. In Israel he has worked as supervisor (1956–74) and chief supervisor (1975–88) of music education for the Ministry of Education and Culture, besides appearing widely as a lecturer on Israeli and contemporary music. In 1997 Orgad won the Israel Prize in music, the highest national award.

A defining aspect of Orgad's music is its roots in the Hebrew language. Patterns of intonation and metrical values typical of biblical and modern Hebrew are expressed in extended modal tonalities, *maqām* and chromaticism, while the melos and melismas originating from the rich Eastern and Western traditions of chanted biblical tropes are also present. These are discussed in his article 'The Musical Potential of the Hebrew Language and its Manifestation in Art Music' (1978). Personal *maqāmat* are recognizable in early works, such as *Out of the Dust* (1956) and *Monologue* (1957), as well as in the seven *Filigree* works (1989–97). Since *Mizmorim* ('Songs of Thanksgiving and Praise') (1966–8) he has exploited simultaneity as a means of construction, employing diverse sound groupings, different texts in one or more languages, and varied spatial dispositions. His passion *Ha-gzerot ha-yeshanot* ('The Old Decrees') (1970) and the orchestral *Ballade* (1971) are further examples, while tonal gesture has become an additional element since *Reshuyot* in 1978. Orgad has used the term 'tonescapes' to indicate an intentional relation to 'spiritual sites', with Jerusalem the most common, from *Ḥazon Yesha'yahu* ('Isaiah's Vision') (1953) to *Shtay Petikhot* ('Two Openings') (1995), as well as Galilee in the seven *Filigree* works and Terezin in *Makom Ishi* ('A Personal Place') (1995). In *Makom Ishi*, *Hityaḥadut shniyah* [Individuations no.2] (1990) and *Ha-gzerot ha-yeshanot*, the use of German and Yiddish songs merges the 'site' into the simultaneous texture. Orgad has stressed the significance of collaboration with performers and how they are latent partners in his creative process. Many of his musical characteristics are also expressed in his three books of poetry, his translation of 40 of Paul Celan's late poems (1987) and his prose works.

WORKS
(*selective list*)

VOCAL

Choral and orch: Sipur ha-meraglim [The Story of the Spies] (Bible: *Numbers*), 1951; Ḥazon Yesha'yahu [Isaiah's Vision], 1953; Ha-gzerot ha-yeshanot [The Old Decrees] (Passion MS from Darmstadt, 1096), S, Mez, T, Bar, vv, chbr orch, 1970; Sipuro shel ḥalil [Story of a Pipe] (after S.Y. Agnon), S, Mez, Bar, vv, orch, 1972; Yisurei ge'ulah [Sufferings for Redemption] (S. Ibn Gabirol), Mez, female vv, orch, 1974; And this is the Blessing, 1993

Solo vocal and orch: Tfilah (Prayer), Bar, chbr orch, 1948; Ha-sui Yisra'el [The Beauty of Israel] (Bible: *II Samuel*), sym., Bar, orch, 1949; Mizmorim [Songs of Thanksgiving and Praise] (Bible, trad.), S, A, T, B, chbr orch, 1966–8; Shirim ba-boqer ba-boqer [Songs of an Early Morning] (A. Gilboa), (Mez, Bar)/Mez, chbr orch, 1968; Iltam Zumra [A Hymn to the Goddess] (Sumerian, Akkadian texts), Mez, Bar, chbr orch, 1989

Unacc. choral: Eikhah nissa [How Shall We Bear], SATB, 1947; Adonai adoneinu [O Lord, our Lord], motet, male vv, 1952; Nesi'at Kapayim [Blessing of the Priests], cant, 3 SATB, 1976; Songs of the Choshen Valley, 8 songs, SATB, 1981

Solo vocal with insts: Min he-'afar [Out of the Dust] (E. Ur), Mez, fl, bn, va, vc, 1956; Death Came to the Wooden Horse Michael (N. Zach), 2 S/Mez, 9 insts, 1968, rev. 1977; Sha'ar sha'ar [Gate], v, vn, va, vc, pf, 1977; Maqom Ishi [A Personal Place], Mez, fl, cl, bn, hn, tpt, perc, 2 vn, va, db, 1995

INSTRUMENTAL

Orch: Mar'ot [6 Movts], 1947; Choreographic Sketches, 1953; Bamot bonim la-melekh [Building a King's Stage], 1957; Music, hn, orch, 1959; Kaleidoscope, 1961; Ashmoret rishonah [First Watch], str qt, str, 1969; Ballade, 1971; Ashmoret shniya [Second Watch], chbr orch, 1973, arr. sym. orch, 1982; Dialogues on the First Scroll, chbr orch, 1975; Ashmoret shlishit [A Vigil in Jerusalem: Third Watch], 1978; Hallel [Praise], 1978; Hityahadut [Individuations no.1], concertante, cl, chbr orch, 1981; Hityachadut shniyah [Individuations no.2], concertante, vn, vc, chbr orch, 1990; Toccata in a Galilean Maqam, 1994

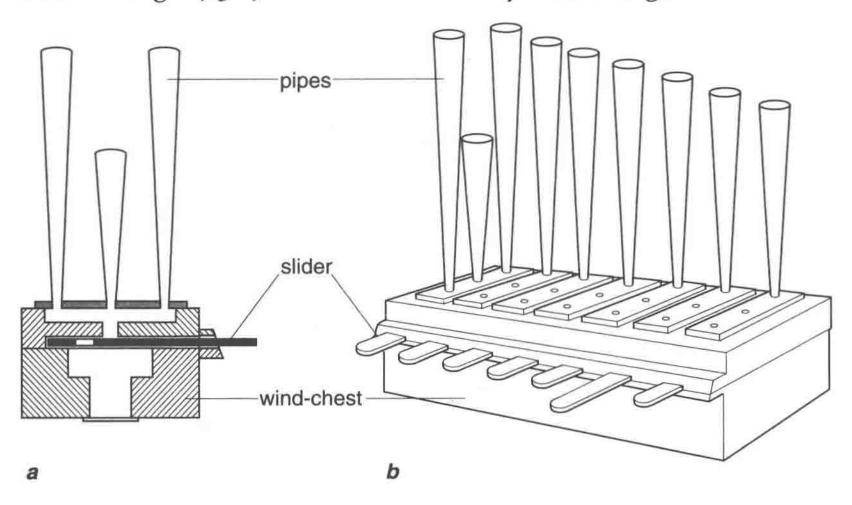
WILLIAM Y. ELIAS/NATHAN MISHORI

Organ (Fr. *orgue, orgues*; Dutch, Ger. *Orgel*; It., Sp. *organo*; Dan. *Orglet*; from Gk. *organon* via Lat. *organum*). A wind instrument consisting of one or more scale-like rows of individual pipes of graded size which are made to sound by air under pressure directed from a wind-raising device and admitted to the pipes by means of valves operated from a keyboard. Although this definition could include such instruments as the REGALS, PORTATIVE, POSITIVE and CLAVIORGAN, this article is concerned with the larger organ proper.

The organ is, together with the clock, the most complex of all mechanical instruments developed before the Industrial Revolution. Among musical instruments its history is the most involved and wide-ranging, and its extant repertory the oldest and largest (*see* KEYBOARD MUSIC, §§I–II; *see also* CONTINUO). Despite its essentially indirect and therefore relatively inflexible production of sound, no other instrument has inspired such avowed respect as the organ, 'that great triumph of human skill ... the most perfect musical instrument' (*Grove1*), 'in my eyes and ears ... the king of instruments' (Mozart, letter to his father, 17–18 October 1777).

I. Word origin

Plato (*Laws*) and Aristotle (*Politics*) both used the term 'organon' to denote a tool or instrument in a general sense: something with which to do a job of work (*ergon*, from root *uerğ-*; cf *Werk*, 'work'). Plato (*Republic*) and later authors also used it to denote any kind or all kinds of musical instrument or contrivance. No Greek author used it to mean 'pipe organ', and even in the term 'hydraulic organ' (1st century CE) used by Hero of Alexandria 'organ' has the sense of tool, so that the whole term properly indicates 'an aulos-like device or instrument, operated by water'. (In this context, moreover, 'aulos' may indicate not the musical wind instrument of that name but 'pipe', 'conduit' etc.; thus 'hydraulic' refers to the water and air conduits.) Classical and patristic Latin show a fairly clear evolution of the terms 'organum', 'organa', 'organis' from a general to a specific sense, and a musical connection is often clear from the context, more consistently so than in Greek. 9th- and 10th-century Arabic had its own versions of the Greek, for example *hedhrula* ('hydraulis') and *urghanon* ('organon'). The use of 'organum' to denote a kind of polyphony is of course post-classical (*see* ORGANUM).



In his commentary on Psalm cl St Augustine correctly explained the Vulgate word 'organum' as derived from 'a Greek term', and thought it unlikely to be correct in this psalm. He defined it as follows (the English translation is by John of Trevisa, 1398): 'Organum is a generall name of all Instrumentes of Musyk: and is nethelesse specyally apropryte to the Instrument that is made of many pipes; and blowen wyth belowes'. In one sentence St Augustine used the singular *organum* and the plural *organa* for the same object, thus foreshadowing late medieval usage of the plural in English and in Old High German (Notker Labeo's *diu organâ* and *orglun*) and present-day usage in Slavonic languages, (*varhany, orgány*: plural). The English derivatives of 'organ' ('organic', 'organize') are mostly post-medieval terms, and are sometimes found first in the musical sense (i.e. 'organic': 'like organs'), sometimes first in the non-musical sense: 'organize', 'to give an orderly structure to', appears in the 17th century, while 'organize', 'to supply one or more sets of organ pipes to' a harpsichord or piano, appears in the 18th century, probably from French usage (e.g. *clavecin organisé*). The plural 'organs' denoting a single object (e.g. *orgues/ogres, Orgenen/Orgeln* in 12th-century French and German verse) belongs to the musical use of the term. In some languages, notably French, the singular *orgue* seems much the later term, but documents are inconsistent (e.g. 'money paied to the organe maker for the orgonis', 14th century). A 'pair of organs' was a phrase used in 17th-century England generally to denote an organ of any size. During the 16th century, particularly in documents prepared by non-musicians, a 'pair of organs or virginals' may perhaps have indicated an instrument with longer than average compass, but more probably meant merely an 'instrument of many pipes or strings' (cf a 'pair of stairs' in 15th-century French and English). By 1613 the new two-manual organ of Worcester Cathedral was called 'Double Organ', and it is this kind of instrument that was normally meant in 17th-century contracts (e.g. those of Durham, Wells and Canterbury, all 1662) and in the voluntaries for Double organ popular from around 1640. The agreement from Canterbury is explicit: 'A Double Organ, viz a great Organ and a Chaire Organ' (*see* DOUBLE ORGAN). Biblical use of 'organ' in English translations is unreliable. Septuagint Greek uses *organon* most often in its general sense of 'tool'; Old Testament Hebrew uses *ûgab* on four occasions, apparently to indicate some kind of wind instrument, perhaps a vertical flute; Vulgate Latin uses *organum* indiscriminately for both.

'Organ', 'orgue' and 'organo' are also used in the sense of *Werk* to denote individual manual or pedal departments of the whole instrument. Before about 1675 such terms applied only to departments built into separate organ cases. In England, Echoes and Swells were not usually called 'Swell Organ' before about 1800, although by about 1850 all departments of an organ were referred to as 'organs'.

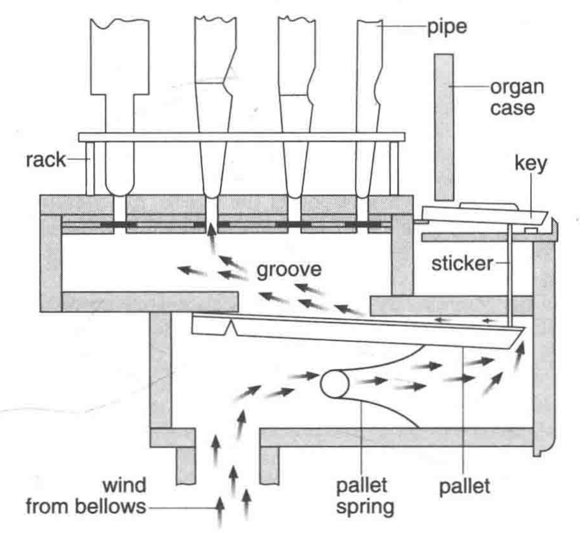
II. Construction

There are three main parts to the construction of an organ: the wind-raising device, the chest with its pipes, and the (keyboard and valve) mechanism admitting wind to the pipes. These three parts are common to any pipe organ; it is in their precise nature that essential differences lie – from the small hydraulic organ of the 3rd century BCE; to the monster electric organ of the 1920s. At different points in history builders have tended to develop different parts of the instrument, while at other times (*c*1400 and *c*1850) all parts saw intense development.

1. HYDRAULIC ORGAN. Said to have been invented by the Alexandrian engineer Ctesibius, this most primitive

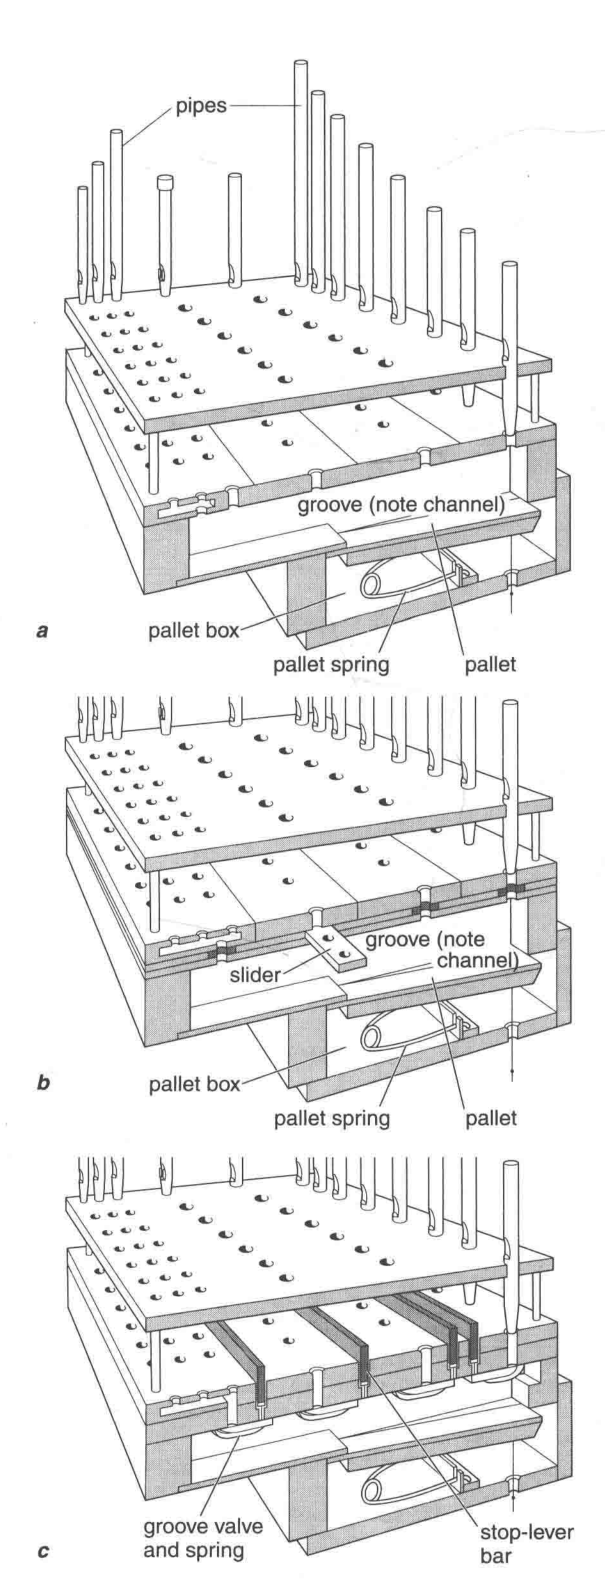
1. Chest of Theophilus's organ: (a) cross-section; (b) perspective view

form of organ, which was known from Greco-Roman times through numerous descriptions and iconography, differed from later versions in that the wind supply to the pipes was regulated by water-pressure rather than by weighted bellows. The number of pipes and compass of keys were small, and it was frequently used outdoors, and in various secular ceremonial functions. For a full discussion and illustrations of its construction, *see* HYDRAULIS and see also §IV, 1 below. It is not to be confused with the later WATER ORGAN, a normal pneumatic organ in which the bellows were operated by water power.



2. A MEDIEVAL CHEST. Fig.1 shows how in Theophilus's organ (11th century) the wind, raised by two or more bellows operated by the blowers' body-weight, is admitted to the several ranks of pipes when a perforated hand-slider is pulled out until its hole is aligned with the vertical channel between the wind-chest and the pipe-foot; to obtain a 'clean' sound, the slider must be operated as quickly as possible. To stop the sound, the slider is pushed back. The whole chest could be made of wood or moulded metal.

Other medieval chests differed significantly. According to the description in the Berne Codex (11th century), the wind did not pass to the two ranks of pipes from one duct but each pipe had its own duct from the wind-chamber below; thus the hand-slider required as many holes to be aligned as there were ranks. Also the 'key' was (like that of the hydraulis) a pivoted square which, when depressed, would push the slider into sounding position, while a spring pulled it back afterwards to its blocking position. Early medieval positives and portatives probably worked by one or other of such systems, which do not of themselves presuppose any particular size.



3. A POSITIVE (OR CHAMBER) ORGAN ACTION. In the 'pin action' portrayed in fig.2, wind accumulated in the lower chamber or pallet box is admitted to each upper chamber or groove when the corresponding key depresses the hinged pallet. The new, crucial device in this system is the pallet and its groove or channel, both of unknown origin, although well established by the 14th century. The effectiveness and versatility of the resulting chest construction promoted the development of the Renaissance organ. In theory and (many organists and builders believe) in practice, the grooved or 'barred' chest facilitates tonal blend between the several pipes belonging to each key. Later medieval positives probably had a similar action, in most cases to fewer (and often sliderless) ranks of pipes; later medieval portatives also probably worked from a similar (though simpler and more compact) pin action, whatever the shape and size of the keys.

4. DETAILS OF MEDIEVAL AND RENAISSANCE CHESTS. Fig.3*a* shows a medieval block-chest (or BLOCKWERK): the opened pallet admits wind to all the pipes on one groove or channel (i.e. all those belonging to one key) and the player is unable to separate the ranks of pipes. To obtain variety of sound some organs had grooves divided into two parts, each with its own pallet; each resulting 'half-chest' could have its wind blocked off with a valve somewhere between bellows and pallet box, though in practice the front half-chest (whose pipes were those of the case front or Open and perhaps Stopped Diapasons) played all the time. Each key in such a double chest operated two pallets. The reliability and wind-saving virtues of this system gave it some popularity in the Netherlands during the 15th century.

In the slider-chest (? late 15th century) shown in fig.3*b*, the opened pallet admits wind to each single or multi-rank 'stop' by means of a perforated slip of wood ('slider')

2. Pin action in a Renaissance or Baroque chamber organ

3. Medieval and Renaissance chests: (a) medieval block-chest; (b) ?late 15th-century slider-chest; (c) early 16th-century spring-chest

running longitudinally in the board between the pipe-foot and the groove on the upper level of the chest. The slider can be aligned either to allow wind to pass through ('stop drawn') or to prevent it passing through ('stop pushed in'). By means of rods, trundles and levers, the sliders can also be operated by a 'stop-knob' near the player (below and in front of the chest itself). Sliders were known first in small organs, perhaps as early as 1400, but were not much used in larger ones (or the larger departments of two-manual organs) until the 16th century.

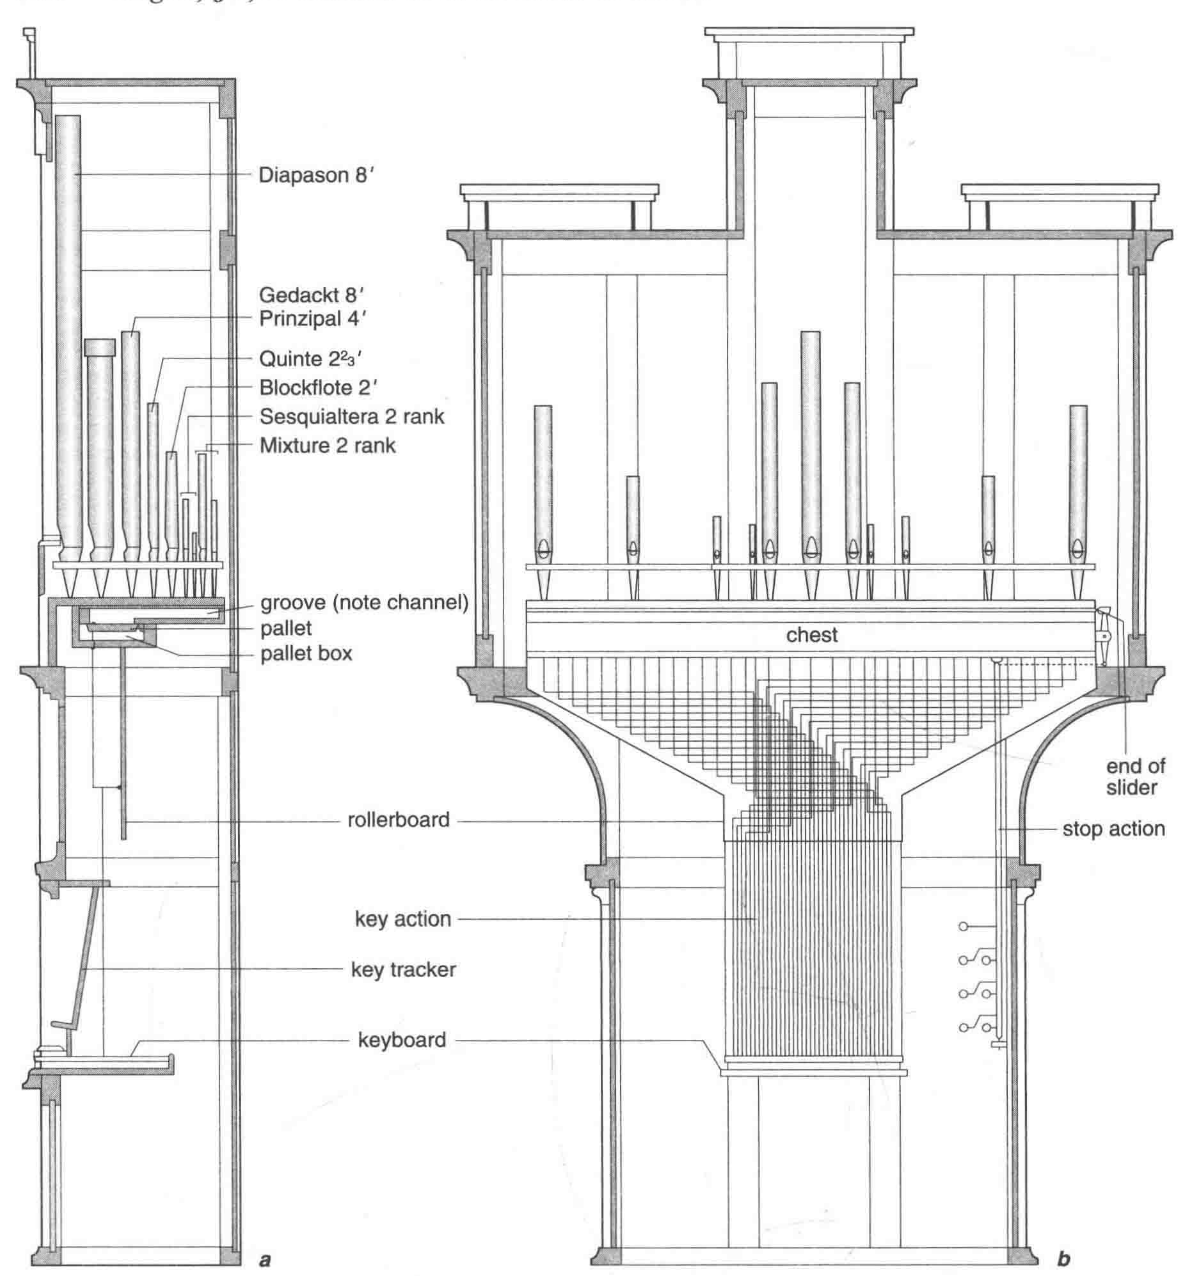


Fig.3*c* shows a spring-chest (early 16th century) in which the opened pallet admits wind to each single or multi-rank stop by means of a secondary pallet or 'groove-valve' for each, which is operated by the stop-lever bar. The spring acting on the secondary pallet also causes the bar to spring back to the 'off' position unless prevented (i.e. unless the player notches the stop-lever at the keyboard into the 'on' position).

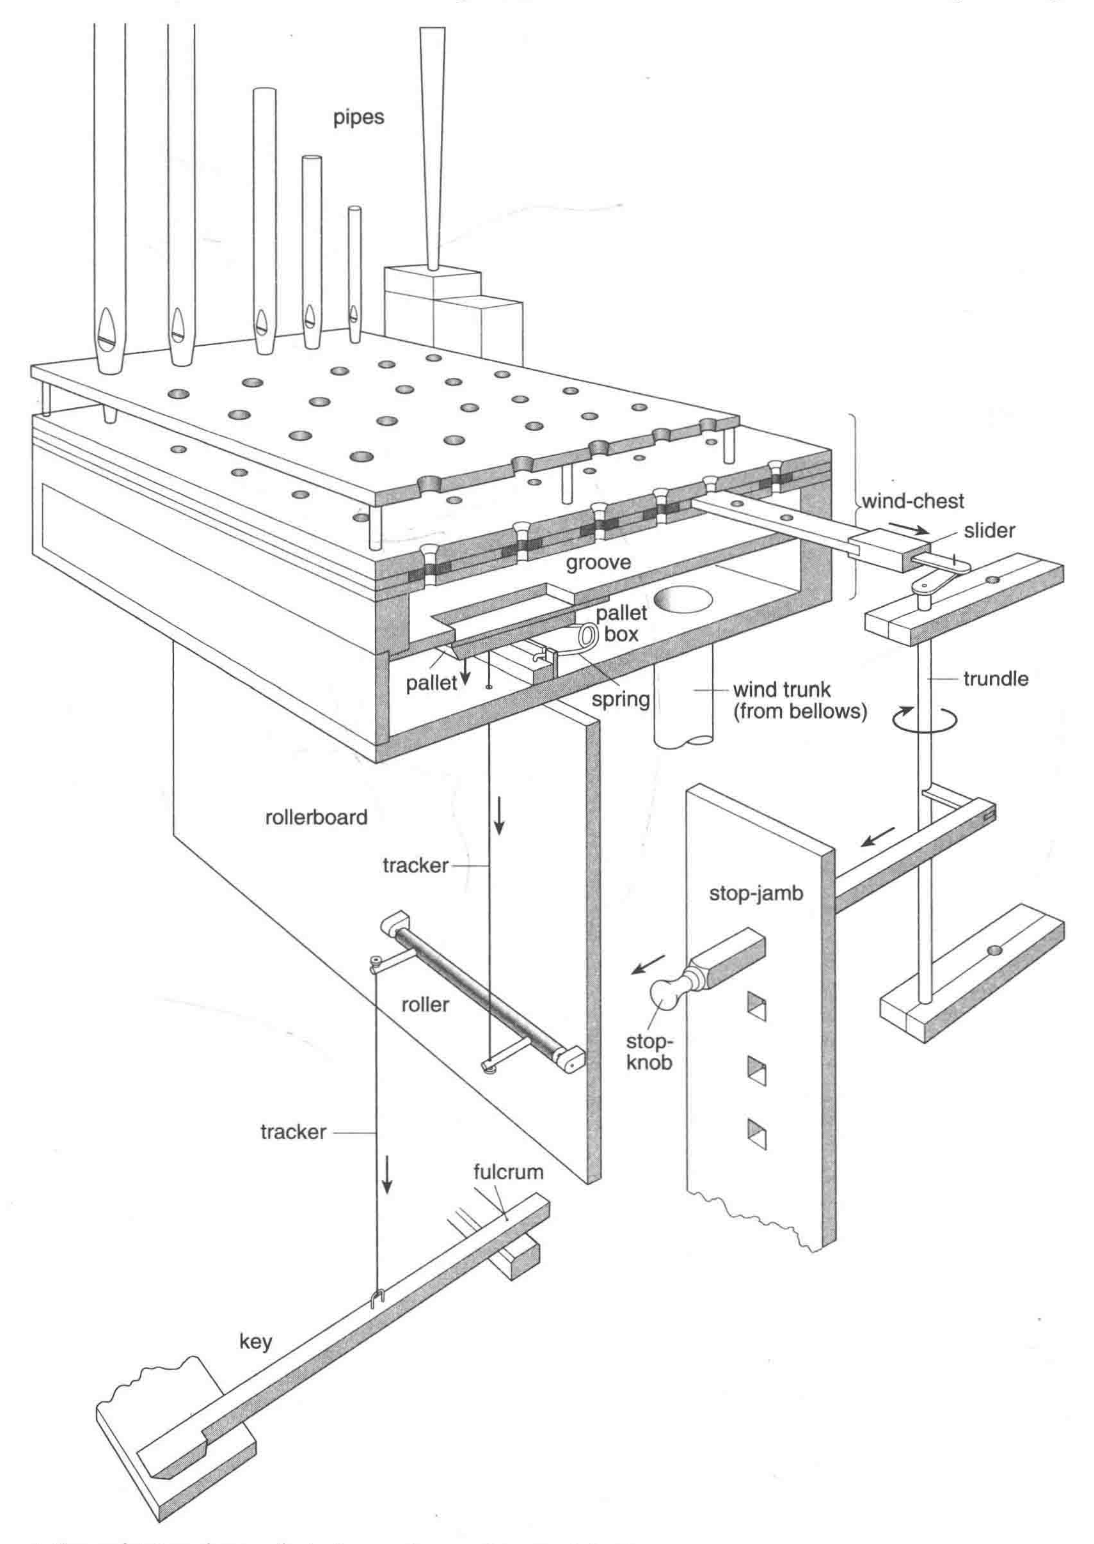
Other spring-chests differed significantly. Many of the Italian examples from the late 15th century onwards had their secondary pallets placed vertically rather than horizontally, with the result that the bar moved horizontally. Because brass springs lose their flexibility in time, some builders in 16th-century Italy and 17th-century Germany designed the chest so that all the secondary pallets belonging to one groove could on occasion be pulled out in one strip (looking like a long, narrow drawer) and the faulty spring replaced without dismantling the pallet box.

The spring-chest is troublesome to make, as 17th-century theorists such as Mersenne and Werckmeister noted; it also takes up more room than a slider-chest. But it is said that spring-chests last longer, and (although no results of controlled experiments have been published) cause the pipes to speak better. Since there could be no loss of wind through shrinking or warping of sliders, spring-chests probably contributed to greater stability of tuning, although their complexity would be likely to make them more sensitive to the extremes of humidity and dryness found in modern, centrally heated churches. While the spaciousness of the chests dictated by the spatial requirements of the 'groove-valves' makes pipes and action more accessible for tuning and repair, it also requires that the main key pallets be made larger, making the touch heavier and less sensitive than that of slider-chest organs. This may be why the spring-chest was abandoned in the north, where higher wind pressures complicated this situation.

5. Mechanical action. Fig.4 depicts the side and front elevation of a single-manual organ with suspended action. Organs of this simple construction have been built since at least the 15th century; larger and more sophisticated instruments of this type were being built in Spain, Italy and Central America as late as the 19th century, and there was a revival in the use of this action during the late 20th century.

In this action, shown in exploded detail in fig.5, all motion is in the same (downward) direction. A tracker attached to the centre of a key which is hinged at the back end descends when the key is depressed. As the width of the chest is greater than that of the keyboard, the action is intercepted by a roller, which transfers the motion horizontally to another tracker, which in turn pulls down the pallet in the chest, admitting wind to the groove under the pipe. Very small or very primitive organs can be found



4. Tracker action mechanism: (a) side view; (b) front view

in which the rollerboard is eliminated and the trackers simply fanned or splayed to correct the discrepancy between key-scale and chest-scale.

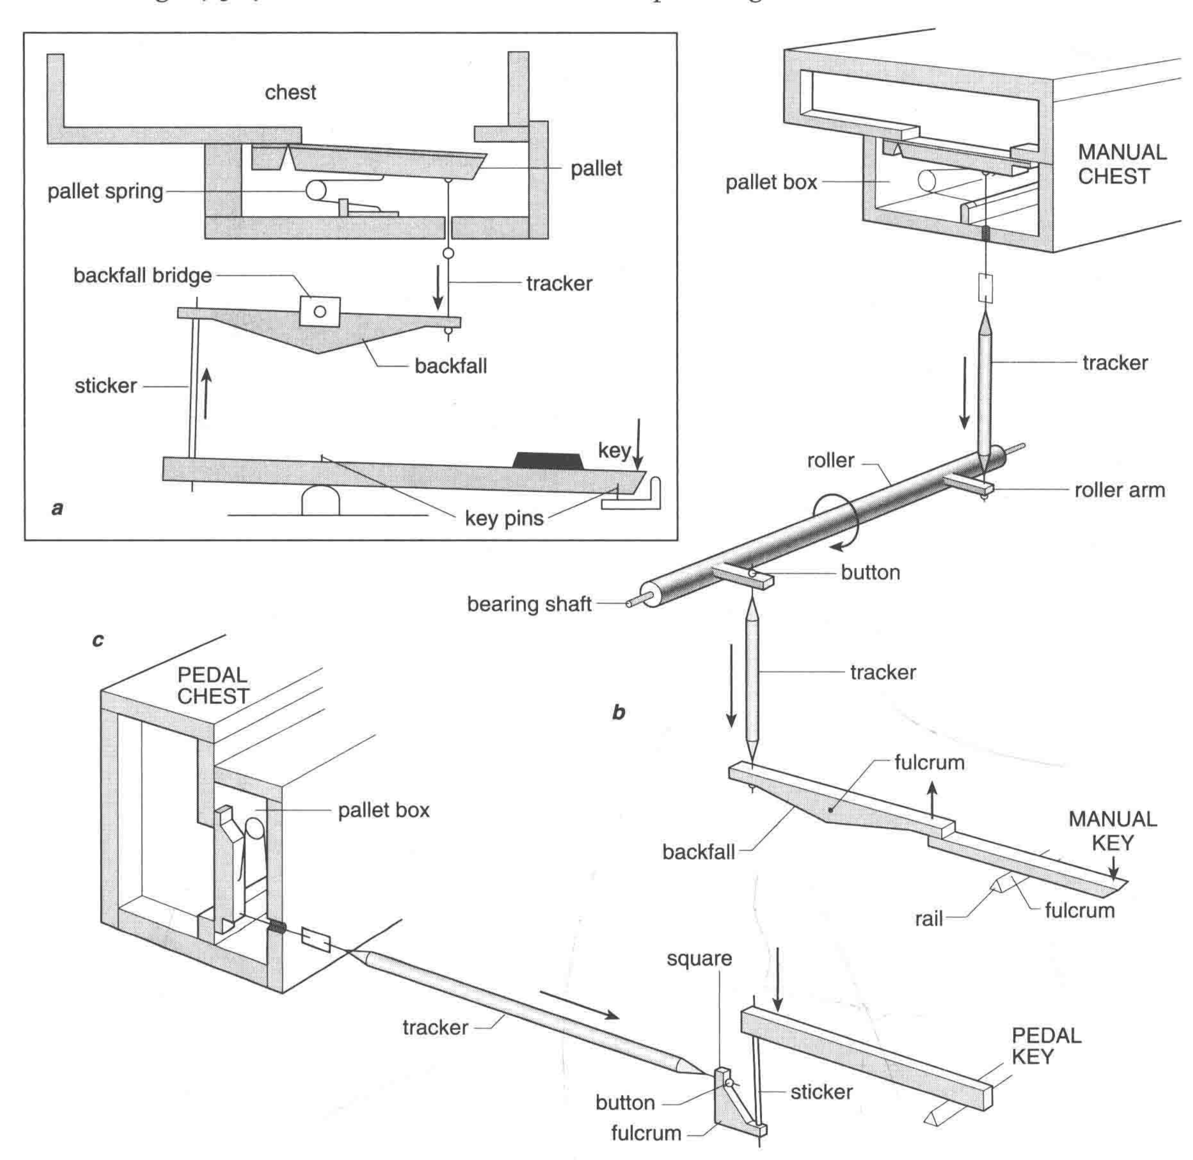


Fig.6 depicts the so-called balanced action which originated in north-western Europe in the 17th century, was adopted in England shortly before the beginning of the 18th century and was widely used in the 19th century. This action, which allows for more flexibility in the location and number of chests, involves a transfer of motion direction. Fig.6*a* illustrates how the key, when depressed, pushes up one end of the balanced backfall, causing the opposite end to descend, pulling down the tracker attached to the pallet; in this simple arrangement the backfalls must be splayed to compensate for the difference between key-scale and chest-scale, but it is also possible for them to remain key-scale and communicate with a rollerboard, as shown in fig.6*b*. Fig.6*c* shows another variant (illustrated here in the pedal department, although the mechanism may also be applied to the manuals) in which motion is transferred by means of a rocking square.

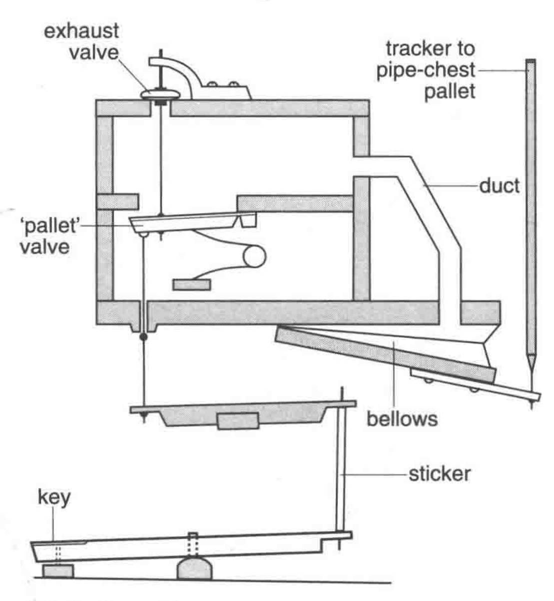
Regardless of the type of key action (suspended or balanced), the stop action usually operates in the manner depicted in fig.5. The stop-knob is attached to a rod which is attached either to a rotating trundle (as shown), or, by means of squares, to a rocking arm, which in turn draws or retires the slider associated with a particular rank of pipes on the chest.

5. Key- and stop-mechanism of a single-manual organ with suspended action

6. A NORTH EUROPEAN ORGAN. Fig.7 shows a four-manual instrument in cross-section; only a selection of pipe-ranks is indicated. In this design, the pedal-chests may be to the left and right of the main case or (with less immediacy of sound) behind it. The space between bench and Chair Organ was often enlarged in churches in Roman Catholic countries to accommodate a choir and orchestra; special stops (cornet), chests (echo chests), and toy stops could be conducted off the main wind-trunks; one or more departments could be enclosed in a Swell



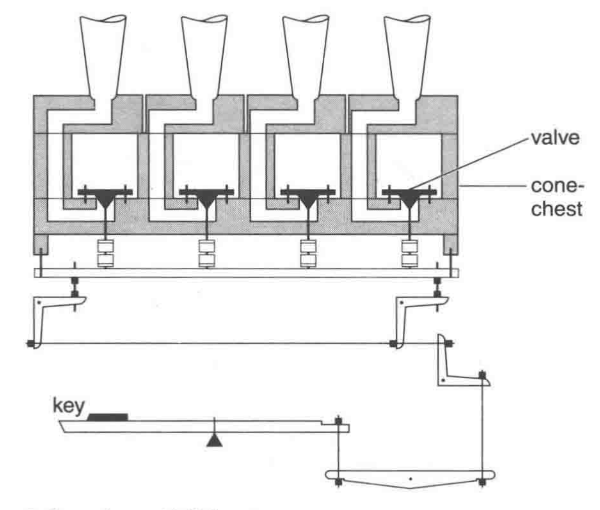
6. Key-mechanism of a single-manual organ with balanced action

box; Tremulants could be fixed in the main trunk, a subsidiary department trunk, or the trunk of an isolated stop (*see* TREMULANT).

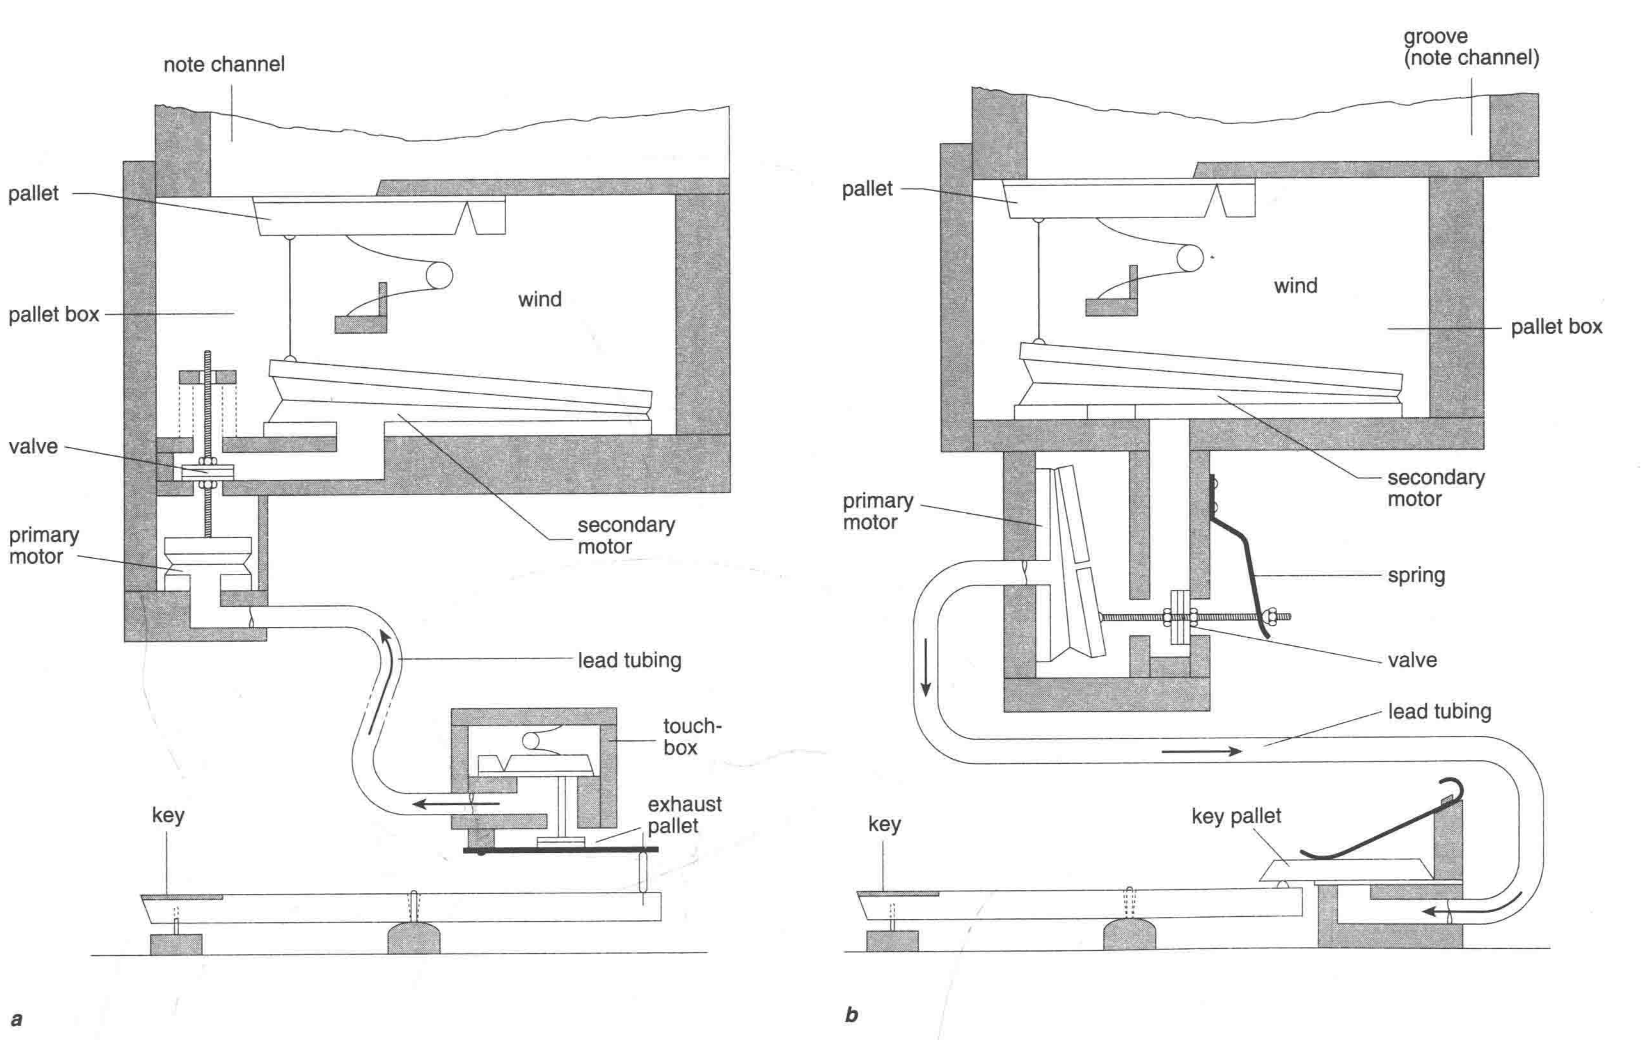
7. BARKER-LEVER ACTION. Fig.8 illustrates the principles of a mechanism invented in the mid-19th century by CHARLES SPACKMAN BARKER and constantly redesigned and patented by countless other builders. When a key is depressed, air under pressure from the main bellows is admitted through a pallet-like valve to inflate small bellows (one for each key) which, in moving, travel sufficiently to pull a tracker connected with the pipe-chest pallet. On release the exhaust valve at the top allows the small bellows to deflate immediately. In this way, average light finger pressure on the key brings into play a wind-power sufficient to operate pallets at some distance from the player, especially those of large-scale pipes and on chests working under high wind pressure (e.g. Solo organ). The pneumatic unit, or 'Barker lever', is placed inside the organ, near the keyboard, at a point where the tracker rises vertically from the keys and merely intercepts an otherwise traditional mechanical action. Perhaps one of its most important applications is to inter-manual couplers, allowing additional manuals to be coupled to the main manual without significantly increasing key resistance. This type of assisted action was used extensively in France during the second half of the 19th century, and generally used for larger organs in the USA and Britain during the same period.

8. CONE-CHEST (*Kegellade*). The cone-chest, or ventil-chest with cone-shaped valves, is found particularly in 19th-century German organs (fig.9 shows a mid-century example) and was one of several chests developed between 1775 and 1875 in the interests of mechanical reliability. Though bulky, the cone-chest avoided some of the faults to which a working slider-chest was subject, but was more inclined to be affected by extremes of humidity. In the cone-chest all the pipes belonging to a rank are mounted on one channel running the length of the chest;

7. Four-manual north European organ in cross-section



8. Barker-lever action



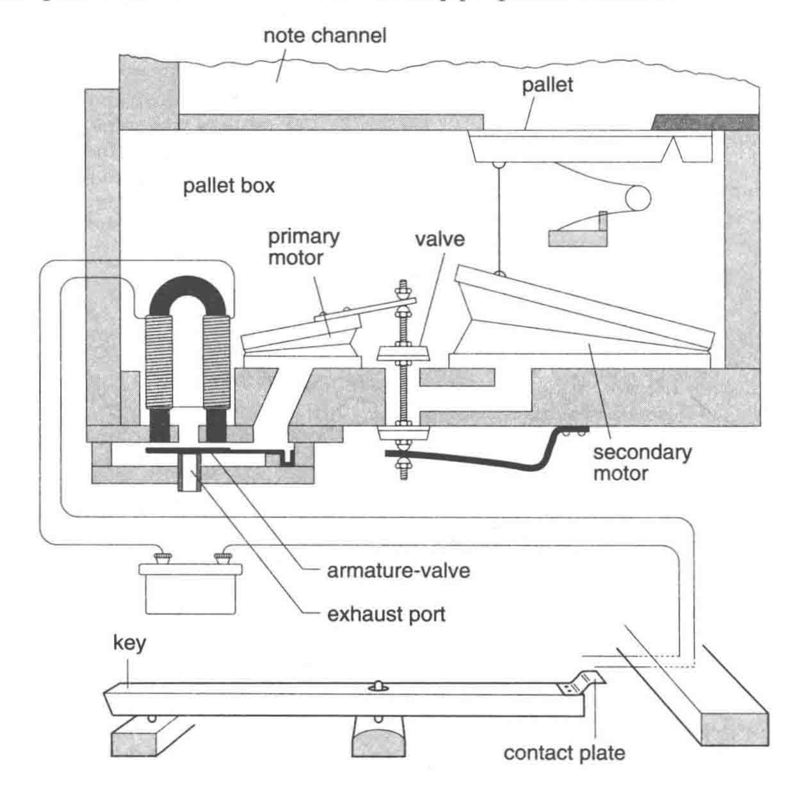
to the whole of this channel wind is admitted when the stop-knob is drawn.

There are no lateral key-channels or grooves in such 'barless chests'. Each key activates a series of cone-shaped valves, one for each pipe; thus although only one stop may be required by the organist, all the other valves move. The valves need not be cone-shaped; they may even be replaced by little discs operated by small bellows-like pneumatic motors.

9. Tubular-pneumatic action. This type of action, shown in fig.10, was developed in the late 19th century, and could be applied either to slider-chests or to the newer individual pipe-valve chests. Two forms of tubular-pneumatic action are illustrated here: in fig.10*a*, when a key is depressed, air under pressure in the touch-box above the key is admitted along the lead or copper tubing to the bellows-like 'primary' pneumatic motor which opens, forcing a valve to rise (hence the name 'pressure-pneumatic action'). This in turn releases air from the

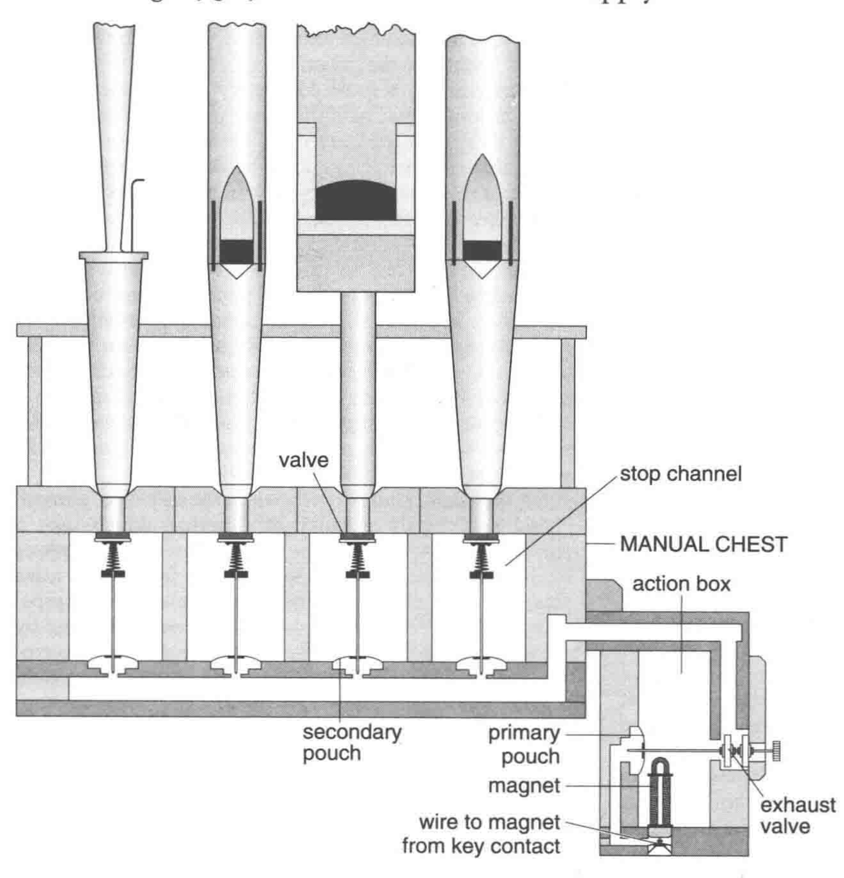
9. Cone-chest, mid-19th century

10. Tubular-pneumatic actions as applied to a slider-chest: (a) pressure-pneumatic; (b) exhaust-pneumatic



pallet box that was held under a secondary motor. The secondary motor collapses under pressure from the wind in the pallet box, pulling open the pallet. 'Exhaust-pneumatic action' (shown in fig.10*b*) is that in which the air under pressure is contained in a box underneath the pipe-chest pallet box, pushing the pallet shut via the secondary motor when at rest; when depressed, the key opens a valve that allows this wind to escape along the lead tubing away from the pallet, collapsing the primary and secondary motors, thus pulling open the pallet. Pressure-pneumatic action never became popular in France, and in England and North America many builders preferred exhaust-pneumatic, believing it to be more prompt, silent and durable. Tubular-pneumatic action continued to be extensively used by builders in Australia and New Zealand until the 1940s.

10. ELECTRIC ACTIONS. From the final years of the 19th century to the middle of the 20th century, electricity was used in a variety of ways by different organ builders and in different countries. The basic premise is that the key (or stop control) closes a switch which sends a low-voltage impulse to a mechanism in the chest. One of the simplest forms, utilizing the traditional slider-chest, is shown in fig.11.

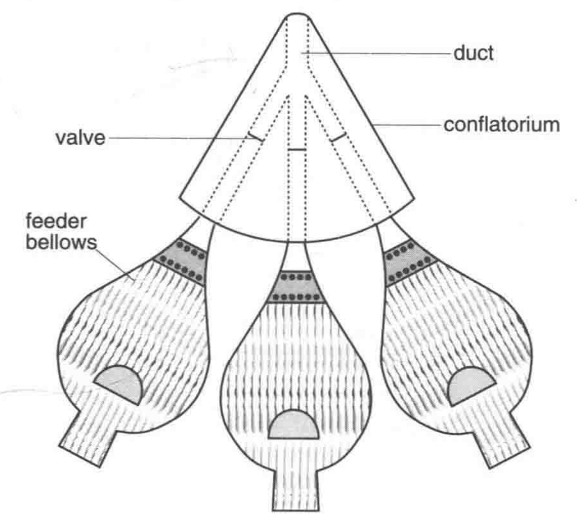


An electro-magnet is activated when the key is depressed and its circuit completed. The armature acts as a valve, rising to the magnet and thus allowing the wind to escape from the primary pneumatic motor (previously filled with wind from the pallet box) which in turn collapses, opening the port below the secondary pneumatic motor and thus allowing its wind to escape. On collapsing, the secondary motor pulls down the pallet. On the release of the key, the circuit is broken, the magnet drops the armature valve and wind is restored to the small pneumatic motor, while the external spring closes the port under the main pneumatic motor which inflates and, assisted by the pallet spring, pushes up the pallet.

Electric action is most commonly used in conjunction with various types of 'individual pipe-valve' chests, in which there is a separate valve for each pipe. An early type, also used in conjunction with tubular-pneumatic action, is the ventil chest (fig.12). In this chest, also called a 'membrane chest', channels isolate the stops, and a stop is activated by releasing wind into its channel. Felt and leather discs attched to thin leather pneumatic pouches replace the larger wedge-shaped pneumatic motors, since less effort is required to open a small pipe-valve. The electro-magnet is activated by an impulse from the key, exhausting a small channel to the primary pouch. This is pushed in by pressure in the action-box, pulling open a larger exhaust port; this in turn causes the valves under the pipes for a given note to be pulled open, admitting wind from the stop-channels into the pipes.

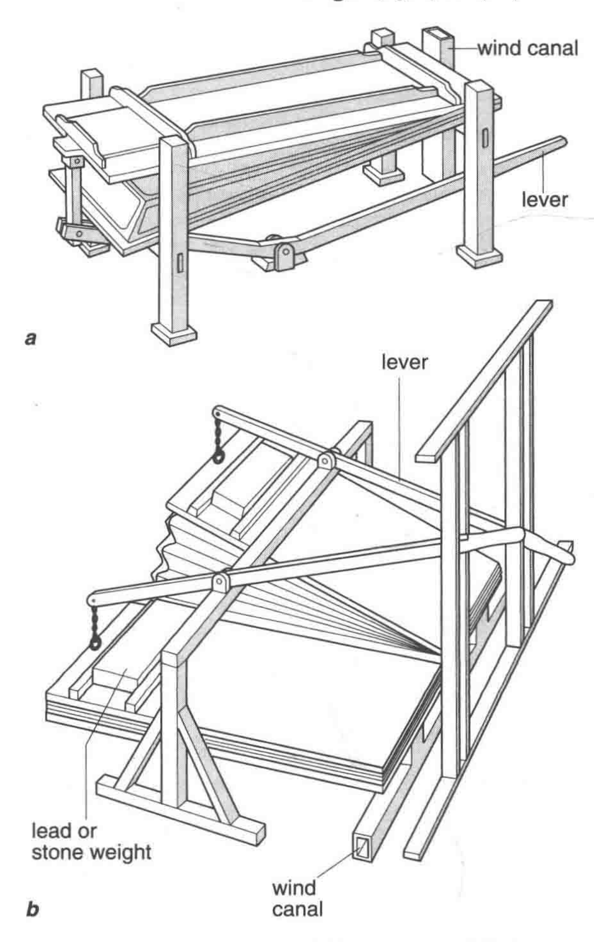
More complex but very efficient is the so-called 'pitman' chest, particularly popular in America, which uses a similar principle to open the pipe-valves. Other kinds of electric action include the Austin type, in which a trace attached to a single pneumatic motor opens all pipe-valves of a given note that have not been disengaged by the stop mechanism, and the 'direct electric' or 'electro-mechanical' type, in which each pipe-valve has its own magnet, directly energized by the key contact, and stop-control is by means of switching mechanisms. For detailed diagrams and descriptions of various chest actions and other electrical mechanisms, see Audsley (B1905), W. and T. Lewis (B1911), Whitworth (B1930) or W.H. Barnes (D(xxxv)1930). Electric actions allow divisions of the organ to be separated and the console to be placed at a distance from the pipes if required. Since electricity takes the place of a direct mechanical connection, however, control over pipe-speech is sacrificed.

11. Electro-pneumatic action as applied to a slider-chest



12. *Simple type of ventil chest, with individual pipe-valves*

11. Wind supply.

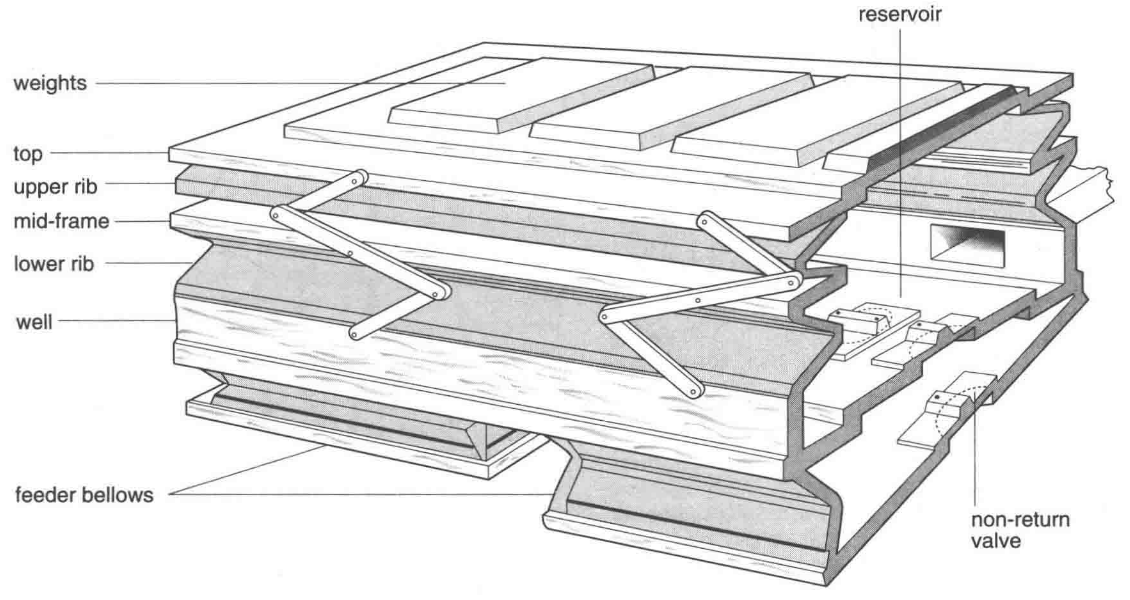


(i) A medieval bellows. In fig.13, derived from Theophilus's organ, air is fed in turn by three 'feeder bellows' through channels meeting inside the *conflatorium* to make one central duct (the inner construction is shown with dotted lines); before the channels meet, the wind passes through a copper valve which opens as the bellows send out air and closes as soon as they are emptied. The collected wind is then directed along a trunk curving up to the pipe-chest. There may be more than one *conflatorium*, and the bellows can be in pairs or larger sets.

(ii) Wedge-bellows. The late medieval bellows (Ger. *Spanbalg*) was wedge-shaped, consisting of upper (movable) and lower (fixed) boards hinged at one end, and wooden ribs hinged with leather. They could be of any size, depending on the size of the organ. They could be single-fold (fig.14*a*) or multifold (14*b*); during the 17th and 18th centuries the former was favoured in northern European countries, and the latter in France and southern European countries. The number of bellows in an organ varied with the size, from the small single-bellows portative to large cathedral organs with eight or more; church organs usually had two to four. Methods of operation varied, but all were based on the principle of mechanically raising the weighted upper board of the bellows and allowing it to 'rest on the wind'; by the time one bellows had been exhausted, another would have been filled, thus assuring a continuous supply. A system of one-way check-valves allowed only the filled bellows to deliver wind to the wind-chests of the organ.

The commonest means of filling the bellows were either by treading (hence the German term *Balgetreter*) on one end of a lever which pushed up the upper board (fig.14*a*), or by pulling down on a lever which pulled up the upper board (fig.14*b*). In some instances, especially if the bellows were located above the organ, a system of ropes and pulleys was employed, but in all cases the motive power was the organ-blower's body weight and muscle. Small or medium-sized instruments could be blown by a single person, but larger ones often required several.

13. *Bellows of Theophilus's organ*



14. Late medieval Spanbalg (wedge-bellows): (a) single-fold; (b) multifold

(iii) Reservoir and feeder-bellows. The wedge-bellows system was universally in use until the 18th century. Although effective, it was bulky, because a minimum of two bellows was needed to provide an uninterrupted supply of wind to the chests of the organ, and even in quite small organs a separate person was required to operate them. Early in 18th-century England a more compact arrangement appeared, perhaps orginally devised for chamber organs, in which a single wedge-bellows affixed to the underside of a board fed wind into a second, weighted wedge-bellows above, which in turn delivered it to the wind-chest. Continuous operation of the lower (feeder) bellows assured that the upper (reservoir) bellows would always contain sufficient wind. In chamber organs, this allowed the player to provide the wind by operating a foot-lever connected to the feeder-bellows; when applied to larger organs, the feeder would still have to be operated by a second person.

An improvement on this system was the replacement, in the late 18th century, of the upper wedge (reservoir) with a horizontal reservoir having usually two sets of ribs with a floating-frame between, expandable on all four sides, which afforded greater capacity within the same space and allowed the entire wind-supply system to be located in the base of the organ-case (fig.15). This reservoir is continuously supplied with wind by two wedge-feeders below it, operated by a rocking lever which opened one while it closed the other. By this means a single person could supply adequate wind to a fairly large instrument, although as larger organs were built in the early 19th century, more than one reservoir (and thus more than one organ-blower) was required.

By the 19th century this system was in universal use in England and America, and was soon adopted in France and elsewhere. Early in the 19th century the English builder Benjamin Flight, noting that a slight pressure-rise occurred as the typical double-fold reservoir collapsed, reversed the fold of the upper set of ribs to help equalize the pressure (fig.15). This system was widely used in England thereafter, although not adopted in America

15. Reservoir and feeder-bellows

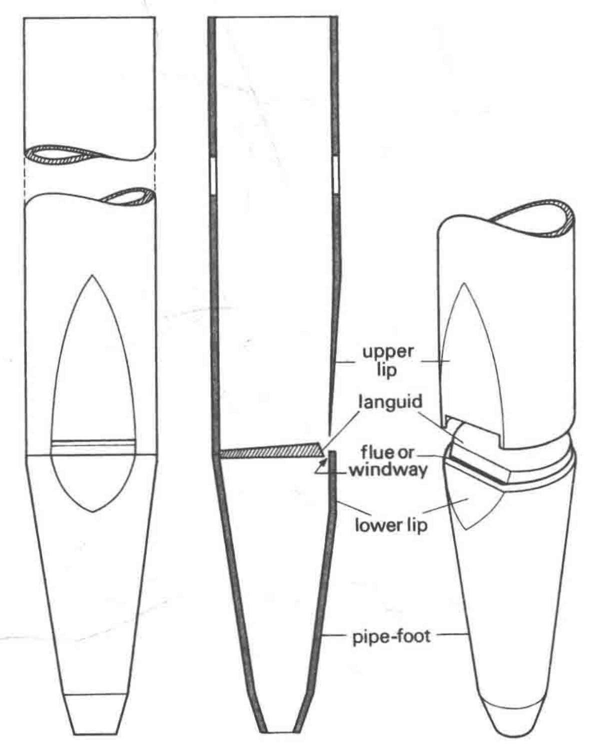
until the 1880s and rarely employed on the Continent save by the French who, following Cavaillé-Coll, devised complex wind systems involving multiple reservoirs of this type, often supplying differing wind pressures. In the 20th century, with the advent of the electric fan-blower, builders elsewhere often adopted this kind of multiple-reservoir, multiple wind-pressure system.

In the mid-20th century, some builders replaced the smaller regulating reservoirs with a spring-loaded 'floating' plate, attached by a rubber-cloth membrane to the bottom of the wind-box of the soundboard. While useful in saving space in small organs, these devices (called 'Schwimmer' by the German builders, a term also adopted by many English-speaking builders) often produced undesirable wind characteristics such as oscillation and pressure-drop unless carefully designed and adjusted.

(iv) Other types of bellows. During the 17th century a type of square, multifold bellows appeared in France, called *soufflets à lanterne* because of their resemblance to multifold paper or parchment ('Chinese') lanterns. The weighted top board was raised by a rope and pulley and allowed to collapse, sending wind to the organ; as with the wedge-bellows, more than one was needed for a continuous supply. In 19th-century Germany, the box-bellows (*Kastenbalg*) appeared. It operated on the same principle as a gasometer, in that a weighted smaller box, fitting snugly into a larger one, was raised by a pulley and allowed to drop, forcing wind into the organ. Neither became widely accepted, probably because the former was more fragile than its wedge-shaped counterpart, and the latter, being made of wood, was liable to get out of order owing to atmospheric changes.

(v) Organ blowing. Until the middle of the 19th century, manpower was the only means of operating the feeders, even in large organs, although in these one sometimes found alternative systems such as a crank-and-flywheel operating three feeders from a camshaft. During the second half of the 19th century, while manpower still sufficed for most smaller church organs, advancing technology offered alternatives for the larger ones. English builders such as Hill and Willis favoured steam power, by which steam-driven pistons supplied the wind in place of the feeders; such a system was employed in the Royal Albert Hall, London, from 1871 to 1920. In America, water power from the mains was preferred, especially by city churches, which were exempt from water taxes. These water motors were quite simple, the principle being a reciprocating piston which was attached to the lever operating the feeders. At the turn of the century, the electrically operated centrifugal fan blower came into use, eliminating the necessity of feeders, and is now almost universally employed.

With the advent of the unlimited mechanical wind supply brought by the fan blower and by the use of multiple small reservoirs, a fashion for 'rock-steady' wind supply emerged, particularly in connection with the 'monster' organs of the early 20th century. Study of the wind characteristics of pre-20th-century organs during the 1970s and 80s began to cast doubt on the musical efficacy of an inflexible wind system. Although this inevitably caused some controversy among both players and builders, by the end of the 20th century many had accepted that a wind system with a carefully calculated amount of natural 'give' is of musical value, especially in organs designed to emulate historical tonal principles. Many of these eschew modern wind systems for reproductions of older types, sometimes with both electric and manual blowing options.



III. Pipework

There are several classes of organ pipes, the two oldest and most integral to the development of the organ being flue pipes and reed pipes. More common by far, though not necessarily more varied, are flue pipes. Both types operate on the coupled-air system of sound production common to flutes, recorders, oboes, clarinets etc.

1. Flue pipes. 2. Reed pipes. 3. Free reeds. 4. Diaphones (valvular reeds).

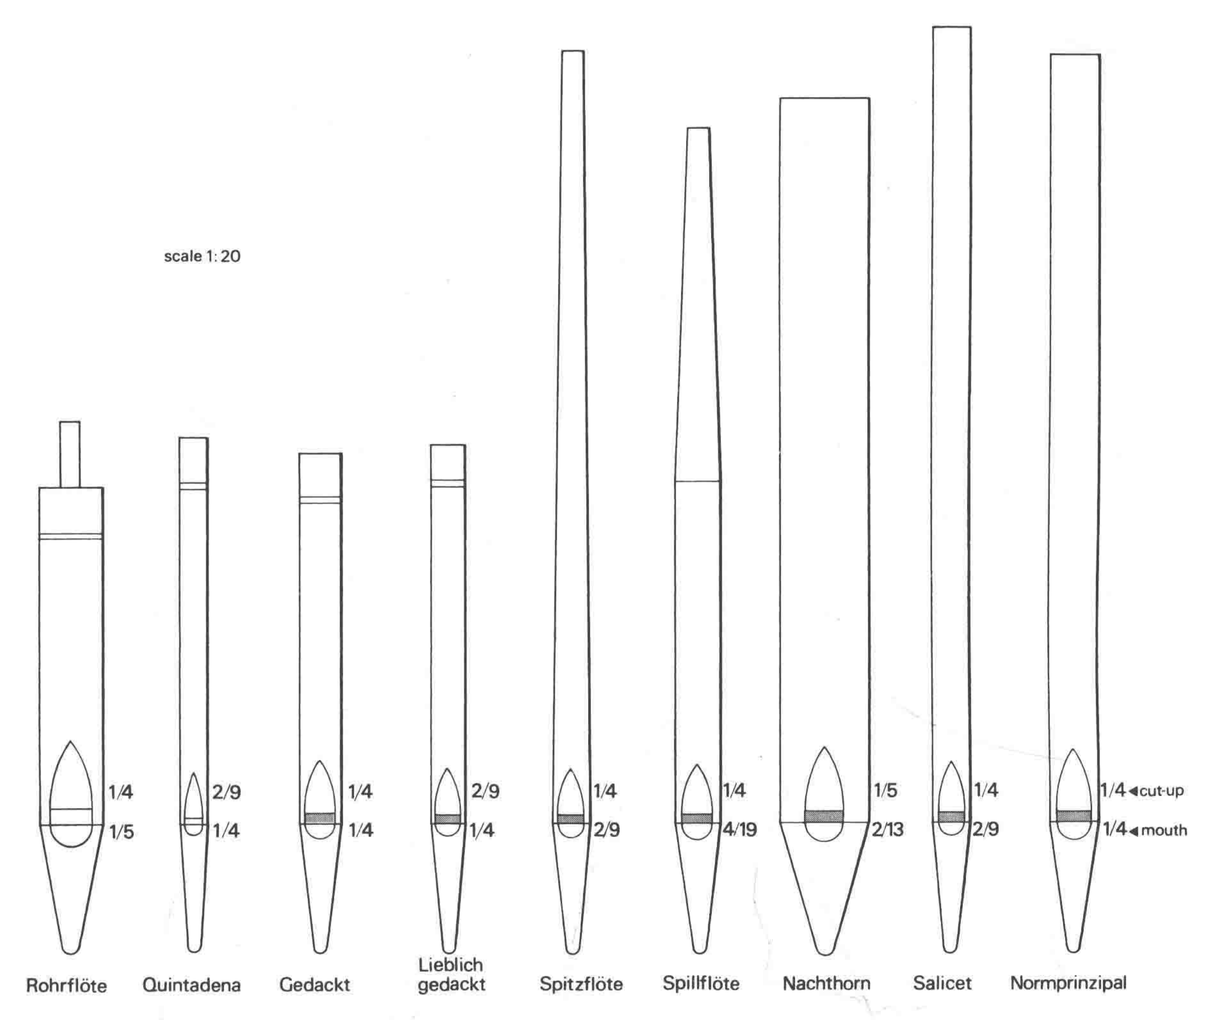
1. FLUE PIPES. Air under pressure from the chest passes through the foot-hole (bore) at the base of the pipe-foot (fig.16) and so through the flue or windway, to issue in a flat sheet of wind striking the edge of the upper lip; the refracted wind causes eddies to form at the mouth, first on one side of the upper lip, then on the other. The natural frequency of the pipe's body is coupled to the note of the 'edge tones' produced at the upper lip and gives to the eddies a rate of production that becomes the frequency of the note produced. Thus the effective length of the pipe is the principal factor in the pitch of the note.

Pitch and timbre are affected by several other factors, few of which, however, are variable outside narrow limits. A narrow pipe, to produce a certain pitch, must be longer than a wide one; a conical one must likewise be longer if it narrows towards the top, but shorter if it tapers outwards. Such variations in shape, however, are generally more important for their effect on a pipe's timbre than on its pitch. A cylindrical pipe stopped at the end will sound approximately an octave lower than if it were open; for a

16. Foot of a metal flue pipe from the front, in cross-section and in perspective

conical pipe the difference is not quite so great. A half-stopped cylindrical pipe (i.e. with its cap pierced and usually a tube passing through the hole) speaks at a somewhat higher pitch than a stopped pipe.

The narrower the mouth or the smaller the flue, then the smaller the volume of air (at any given pressure) striking the upper lip and the softer the sound; the higher the mouth in relation to its width (i.e. the greater the 'cut-up'), then the rounder, duller or more flute-like the tone (hence the designation 'flute stops'); the narrower the pipe as a whole, the richer the harmonic spectrum and the more string-like the tone (hence 'string stops'). It was said at one time that the harder the metal, the richer the harmonic spectrum; or the more lead contained in the pipe-alloy, the 'duller' the sound. But Backus and Hundley (C1966) established from theoretical and experimental evidence that 'the steady tone of a pipe does not depend on the material of the pipewall. The belief that the use of tin in constructing pipes gives a better tone appears to be a myth unsupported by the evidence'. Experienced voicers, however, will aver that the composition of pipe metal does affect tone quality, and that it is impossible to match exactly the tone quality of two otherwise identical pipes made of very different alloys. More to the point, perhaps, is that tin-lead alloys are easy to work and shape, thus allowing the builder a high degree of adjustment at the parts of the pipe crucial to voicing processes.



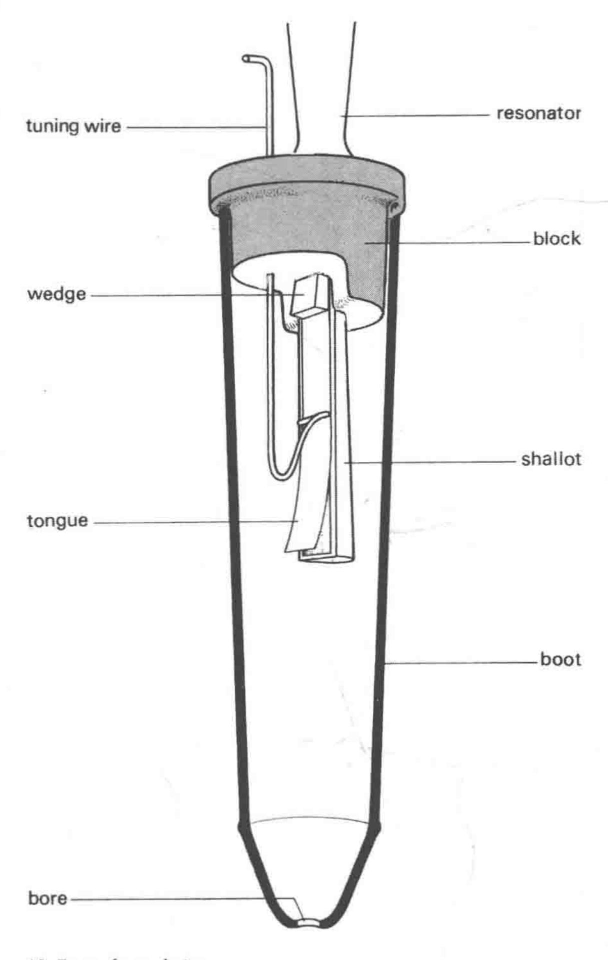
Most of these factors can be used only to a certain degree: a point is soon reached when a pipe will not speak at all, even when other factors are altered, e.g. increasing or decreasing the wind pressure. Consequently the various interrelated factors involved in voicing a pipe require pragmatic expertise in their manipulation.

In addition to its more general usage, the term 'scale' can refer to a pipe's diameter in relation to a norm ('wide' or 'narrow' scale), and the relationship or ratio between one pipe's diameter and that of its octave below in the same rank (3:5 etc.; *see* SCALING). One well-known norm is the *Normprinzipal* suggested at the German Organ Reform (*Orgelbewegung*) conferences in the 1920s; this norm is 'one pipe larger' than the *Normalmensur* promulgated by J.G. Töpfer about 1845 (thus the diameter of Töpfer's C pipe is that of the *Normprinzipal* C♯). G.A. Sorge had been the first to use logarithms to find constant scalings for organ pipes (*c*1760), calculating pipe diameter, pipe length, mouth width and mouth height by this method. Other 17th- and 18th-century theorists (such as Mersenne and Bédos de Celles) suggested scaling-figures by means of tables culled from practical experience and from the empiricism of organ builders themselves. Only two generations after Sorge did Töpfer develop the idea of arithmetical calculation for pipes (with immense influence on builders of his time): he calculated the cross-sectional area of a pipe an octave higher than the given pipe by applying the ratio 1:√8. Thus a pipe with half the diameter of a given pipe is not an octave (12 pipes) above but 16 or 17 pipes above. Such a factor as 1:√8 was itself reasonable, and many older builders had worked more or less to it, though empirically and not rigidly; indeed, Töpfer's formula can be deplored for the encouragement it gave to 19th-century 'organ-factory builders' who applied a constant scale irrespective of the acoustics of the church or indeed any other variable of importance to organ tone. The *Orgelbewegung*'s *Normprinzipal* was similarly abused by some of the less imaginative builders of the neo-Baroque era in the early 20th century.

Fig.17 shows some flue-pipe shapes and is scaled to indicate the relative sizes of different types all producing the same C. (The *Normprinzipal* diameter of the C pipe at a pitch standard of *a'* = 435 is 155·5 mm; at a pitch standard of *a'* = 440, the diameter for C would be reduced to 154·17 mm – a fine point of difference since variations in temperature will change the pitch this much). Most historic types of English Open Diapason, French Montre and Venetian Principale have been wider in scale than the *Normprinzipal*, and for many builders it remains merely one of the possible norms. It must also be remembered that the diagram does not refer to factors other than scaling, such as wind pressure. Mouth widths are usually expressed as proportions of the circumference, and those ordinarily used range from 2:7 down to 1:6, though 1:4 remains common for Principal pipes, and further extremes have been used for special effects. The cut-up is expressed as a fraction of the mouth width, 'quarter cut-up' indicating that the mouth is a quarter as high as it is wide.

Wooden pipes are either stopped (most commonly 8′, then 16′ and 4′) or open (16′, 8′, 4′, 2′); sometimes half-stopped wooden pipes (i.e. with a pierced stopper) of the Rohrflöte (Chimney Flute) type are found, especially in small organs. Metal or wood conical pipes narrowing towards the top have been found in the largest Dutch, German and Spanish organs since about 1540. Metal pipes with 'pavilions' or 'bells' (inverted conical caps) were made especially by French and English builders for about a century from about 1840, both on the flute and string side of tone-colour, as well as in Principals. Overblowing pipes have also been popular in large organs and in special instruments made for colourful secular use; the most common during the period *c*1600–1800 was the narrow-scaled, narrow-mouthed open cylindrical pipe, overblowing to the 2nd partial or 'at the octave' above. Such pipes require to be twice as long as the pitch length (8′ for 4′ pitch). Stopped pipes overblow to the 3rd partial or 'at the 12th' above, and require to be three times as long as the normal stopped length (6′ for 4′ pitch); they are fairly rare. Overblowing flute pipes (Flûte harmonique, etc.) became widely used after the middle of the 19th century, having been developed to a high degree in France. Such pipes are of double length but of the scale of a normal-length open flute, and are pierced at the node (approximately halfway up from the mouth) with one or two small holes. Given full wind, such pipes will overblow, giving a strong, sweet and rather fundamental tone not unlike that of the modern orchestral flute, but are not usually found below 1⅗′ *e′* in pitch, the lower part of the stop consisting of wide-scaled open pipes of normal length. Alternatively, to prevent overblowing in narrow-scaled string-toned pipes, or to aid tuning at the mouth of stopped pipes, 'ears' or 'beards' are often added: these are short metal plates or rods of metal or wood soldered or held to the sides of (and sometimes below) the mouth, protruding from it and helping to direct the vortices of wind on to the edge of the upper lip.

2. REED PIPES. Air under pressure from the chest passes through the bore into the boot and so through the opening in the shallot (fig.18); in so doing the wind sets the thin, flexible brass reed-tongue into vibration against the shallot; this in turn sets the air column in the pipe or resonator into vibration, producing a coupled system.



17. Various flue-pipe shapes scaled to indicate the relative sizes of different pipes all producing the same C

The frequency of the note produced is determined by the length of the air column in the resonator and by the length, mass and stiffness of the reed-tongue.

The pitch and tone of the pipe are affected by many factors; if all the factors are constant, then the longer the reed-tongue and shallot, the lower the pitch. To produce a required pitch in reed pipes with either cylindrical or conical resonators, the resonator must be shorter the longer the tongue. But in practice this property is used within only a small margin, as the tone is more immediately and strikingly affected by a change in the relationship between tongue length and resonator length. Natural 'full-length' ('harmonic-length') cylindrical resonators correspond roughly in length to stopped pipes of the same pitch; for natural 'full-length' conical resonators the 'resonance length' is as little as three-quarters of the pitch length (i.e. 6′ or 7′ for an 8′ Trumpet). A reed pipe will speak (although weakly and without fundamental) without its resonator, whose purpose is to reinforce certain partials, to 'give tone' to the pipe. But in a reed with a resonator a point is soon reached, if the reed-resonator relationship is altered, when the pipe will either fly off its speech or not speak at all. This is particularly true of double-cone reeds such as Oboes and Schalmeys.

The thinner the tongue, the richer the harmonics in the tone it produces; the thicker the tongue, the smoother and more fundamental the tone. Wider resonators produce stronger tone; conical resonators have a 'thicker' partial-content than cylindrical ones. The resonator gives its air column its own natural frequency; when this is greater than that of the tongue (i.e. when the pipe is shorter than the tongue requires for both to respond naturally to the same pitch) the tone becomes brighter, richer in partials. The more open the shallot, the louder and richer the tone; to obtain brilliance from partly closed shallots, higher wind pressure is required; to obtain a rounder, more horn-like tone, 19th-century builders placed the opening higher on the face of the shallot, the curved tongue thus closing the opening before its travel was complete. As in the case of flue pipes, it has been established recently that the hardness of the resonator material (this can be, in order of decreasing hardness, brass, tin, lead or wood) is unlikely to influence the tone – tradition and hearsay notwithstanding. However, the hardness of the tongue material is a definite factor in tone quality. The commonest material used by modern builders is what is known as 'half-hard' brass, but soft brass, hard brass and even (the very hard) phosphor bronze are also used in certain

18. Foot of a reed pipe

instances. The thickness of the tongue likewise has an effect on tone.

Reeds with very short resonators (whatever their shape), and usually of small scale, are called Regal stops and were known from at least about 1475. In practice, most REGALS are either predominantly conical in shape or predominantly cylindrical; they also exhibit an inconstant scale (i.e. relative to the reed-tongues, the resonators in the treble are progressively longer than in the bass). Reed stops with resonators of twice or even four times natural length were sometimes made in the later 19th century, especially by French and English builders, and became equivalent to overblowing flue pipes, although such overlength resonators are generally used only above the pitch of 2′ *c*′. Builders of the 19th century, particularly in those two countries, very often placed their reeds on higher wind pressure than the flue stops (18 cm upwards) by means of divided windboxes and double pallets, in the chest. The desire to supply 'carrying power' by such means, particularly in the treble, had progressively increased in France from about the second third of the 18th century onwards.

Fig.19 shows models of some of the more popular reeds of the early 17th century (*PraetoriusSM*, ii; fig.19*a*) and the late 19th (Audsley, B1905; fig.19*b*). A great deal depends on the use of various shapes and proportions of shallots, and these, like the tube, block and boot, may be made of wood (though this is more often a feature of low-pitched pedal reeds than a general alternative).

3. FREE REEDS. Free reeds were developed in Europe (probably after the Asian *sheng*) towards the end of the 18th century in several areas around the Baltic (*see* FREE REED), and offered the first radically different type of organ pipe since flues and reeds had been perfected. Instead of a shallot with an orifice against which the tongue beats when wind excites it, a thick, oblong plate of brass is perforated with a narrow opening through which vibrates the close-fitting brass tongue (fig.20). It swings freely, hence 'free reed'. The boot needs to be larger than that of a corresponding reed stop to allow copious winding. When made by German builders about 1825 and French builders about 1850, free reeds had resonators of various types and tone-colour, thus being legitimate ranks of organ pipes.

However, some stops, such as the Physharmonika, had instead of individual pipe-resonators one resonating chamber common to all notes of the rank, thus taking less room on the chest. It was such pipeless free reeds that led to the various kinds of harmonium, or REED ORGAN, of the 19th century. Free reeds could be mass-produced more easily than the so-called beating-reed stops, although in itself the workmanship was not inferior. The best builders by no means regarded them as easy alternatives to beating reeds, and the best examples, especially when used at 16′ pitch in the pedal, could sound deceptively like beating reeds.

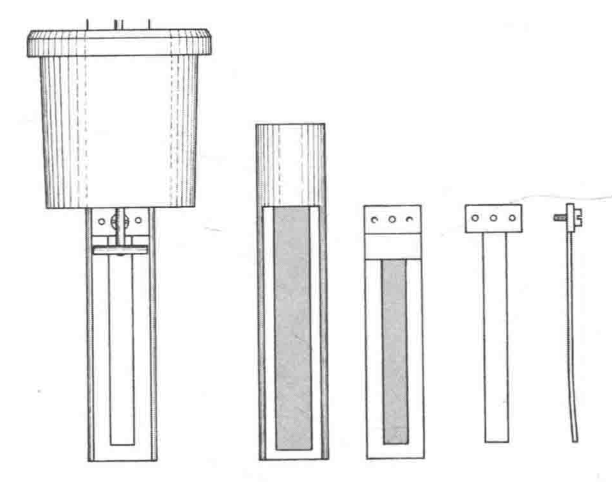
Though less incisive in articulation and weaker in volume than the beating reed, the free reed had a quality highly favoured by its period: it could be made 'expressive'. On admitting more wind to a free reed, the amplitude, but not the frequency, of the swinging tongue is increased; it can thus produce a louder tone without rising in pitch, like a more or less excited tuning-fork but unlike a beating reed. When the free reed was a separate stop in a large organ, however, this property could not easily be exploited. Rarely outside the period 1810–1910, and then most often only in parts of northern France, central Germany and northern Italy, did the free reed achieve much popularity.

4. DIAPHONES (VALVULAR REEDS). In 1894 Robert Hope-Jones took out a patent for a pipe, making use of the fact that any device allowing puffs of compressed air to be projected into a tube or resonating box (i.e. into a chamber holding a column of non-pressurized air) will create a sound if the frequency becomes audible (fig.21). On activation from the keyboard, air under pressure is admitted through the bore and sets the thin 'vibrator' into motion, whereupon the pallet-like disc attached to its free end admits a rapid and regular succession of puffs of air into the resonator (i.e. the pipe standing above). As with the free reed, the tone increases in volume but not in frequency as the wind pressure is increased; but, as is not the case with the free reed, greater wind pressure can make for much power. The tone itself is smooth and powerful, but always 'unblending' and useful only in organs (chiefly cinema organs) conceived on ideals current in a few areas of Europe and the USA between 1900 and 1930. The most enduring application of the diaphone principle has been fog-signalling, and many lighthouse

19. Reed pipes: (a) after Praetorius (2/1619); (b) after Audsley (1905)

diaphones were in regular use in the USA and elsewhere until late in the 20th century.

See also ORGAN STOP and REGISTRATION, §I.



IV. The classical and medieval organ

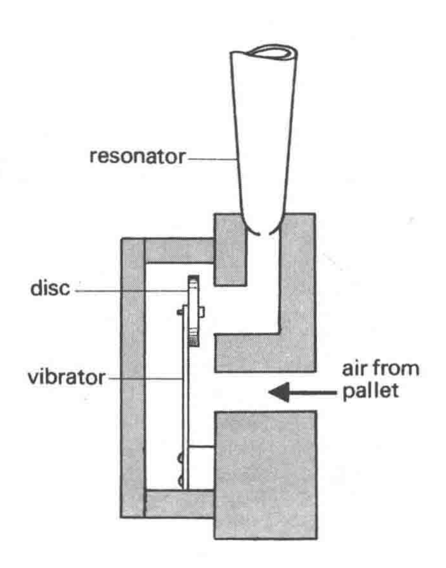
Since the 3rd century BCE it has been possible to regard the organ as an instrument composed of four elements: (i) a wind-raising device operated by lever, pulley or other mechanism, directing air under pressure to (ii) a 'chest' in which the wind is stored until admitted by (iii) a mechanism operated by some kind of keyboard to (iv) one or more rows of pipes (*see* RANK). The absence of any one of these elements prevents an instrument from being properly considered an organ. But other instruments could well have presented models or given ideas to early organ makers, particularly those in east Mediterranean countries. It is unlikely that at any single period the hydraulic organ was so firmly established that builders were indifferent to the influence of such wind instruments as the SYRINX, the MAGREPHA or the BAGPIPE.

The most comprehensive recent surveys of archaeological and documentary evidence relating to classical and medieval organs are the studies by Jean Perrot (D(i)1965), K.-J. Sachs (C1970–80) and Peter Williams (D(i)1993).

1. Greek and Roman antiquity. 2. The Byzantine organ. 3. The organ of the Arabs. 4. Early church organs. 5. Medieval organ theorists. 6. The church organ, 1100–1450. 7. The 15th-century positive and portative.

1. GREEK AND ROMAN ANTIQUITY. No evidence, literary, iconographical, archaeological or even mythological, suggests that the pipe organ existed before the Hellenistic period or originated in any other than the

20. Free reed of an organ pipe



Hellenistic sphere of influence. Later texts such as Athenaeus's *The Sophists at Dinner* (*c*200 CE) and Vitruvius's *De a architectura* (1st century CE) accredit the invention of the HYDRAULIS to one man, Ctesibius, an Alexandrian engineer and practical theoretician of the 3rd century BCE. Curt Sachs's assessment (*SachsH*) of Ctesibius's achievement as uniting a mechanically raised and constant wind supply to a set of panpipes is not a totally unreasonable conjecture; but the surviving accounts of his work (written after his time) make it clear that he had also incorporated a wind-chest and even some kind of keyboard. Thus the hydraulis has the essential features of an organ. That Ctesibius was also said by Vitruvius to have invented a water clock offers an interesting parallel to the makers of organs and clocks in the medieval cathedrals of western Europe: such makers were, in effect, specialists in complex machinery. (*See also* WATER ORGAN.) The principle of the water-pump is shown in HYDRAULIS, fig.2. But forge bellows were known much earlier, and their power potential had already been described in the *Iliad*. Bellows could have provided wind either directly to a regulator-chest under a row of pipes, or indirectly via the cistern of a water organ. But there is no evidence that either of these was done before the 2nd century CE, and it is possible that the organ was indeed born as a kind of engineering model, demonstrating the efficiency of Ctesibius's wind-raising and wind-stabilizing equipment. Hero of Alexandria's account (in *On Pneumatics*) gives no details of the pipes (whether flue or reed, open or stopped) or what the material, size, compass, tuning, pitch or voicing were.

Vitruvius's musical interests are more obvious than Hero's. The ranks of his organ were made to play separately by means of a specially constructed chest in which a channel ran lengthways under each row of pipes, wind being admitted to the channel through a valve operated by an iron handle. The keys are returned to position by an iron spring. As the key was set immediately under its pipes, either the close-set pipes or (more likely) the keys may have been unequally spaced.

The oldest reference to organ playing is a century and a half after Ctesibius: the 'Delphic inscription' (90 BCE), full of implication about the organ's fame. Cicero, Lucretius, Petronius and other authors also wrote of its powers. By the 2nd century CE the Roman organ was heard in some of the more important theatres, games, amphitheatres, circuses, banquets and perhaps processions; a 3rd-century Greek inscription at Rhodes even suggests that it was played in Dionysian festivals. But the cylinder-pump water organ had so many disadvantages – requiring precision engineering and good metal, yet difficult to maintain, move and keep from corrosion – that it is easy to imagine bellows being applied over the years. Eventually, they replaced both pump and cistern, but it is not known when, where and how. Even in the later Roman Empire, however, organs were to be heard, and such poets as Claudian (*c*400) show organ playing to have accompanied celebrations attending accessions to a consulate, weddings and banquets during a period when 'the singer has thrust out the philosopher' (Ammianus Marcellinus, *c*350). Inscriptions found in several provinces far from Rome (Arles, Colchester, Budapest, Asia Minor) make it clear that organ playing was heard in gladiator contests (fig.22).

The few 5th- and 6th-century references include one or two by early Church Fathers, particularly those on the south and east coasts of the Mediterranean. But whether it was from personal experience that such writers as Boethius wrote of hydraulic organs, or Cassiodorus of a bellows-organ with wooden keys, is not certain; nor has 20th-century research shown what music the organ played, much less whether it played polyphony. Much can be tentatively conjectured from the iconographical evidence (*see* HYDRAULIS, §§2 and 3).

Parts of two Roman organs are said still to exist: fragments from Pompeii (now in the Museo Nazionale, Naples) and major remnants of a small organ found in Aquincum, Hungary (now in the Aquincum Museum, Budapest; fig.23). But the Pompeii fragments, which seem to belong to two different instruments, may not be parts of an organ, although their pipes are of cast metal, like those of an organ. The Aquincum organ has a plaque dated 228 CE; its 'reconstruction' in 1959 somewhat hampers more recent study of its parts. It has four rows of 13 cast bronze pipes, one open and three stopped, and a wooden wind-chest, lined inside and out with bronze.

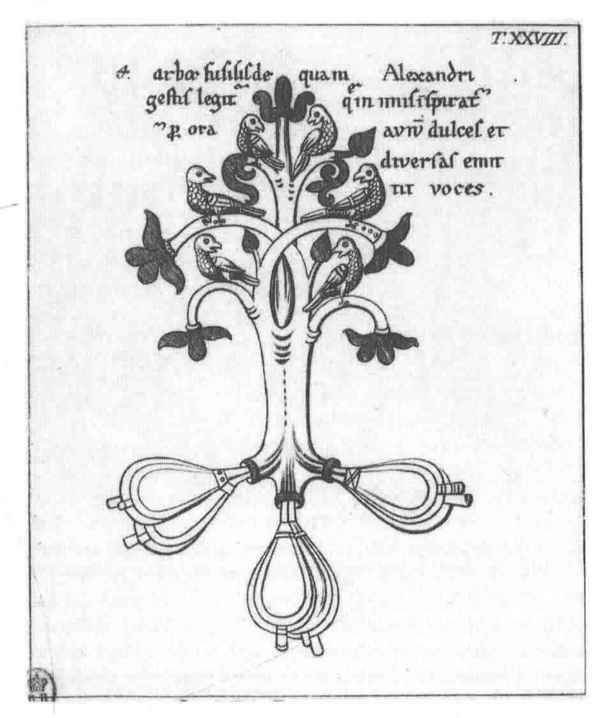
21. Diaphone or valvular reed

22. Hydraulic organ, with tuba and two cornua, at a gladiator contest: Roman mosaic, 1st century CE, *from a villa at Dar Buk Ammera, near Zliten, Libya (Archaeological Museum, Tripoli)*

(a)

(b)

(c)



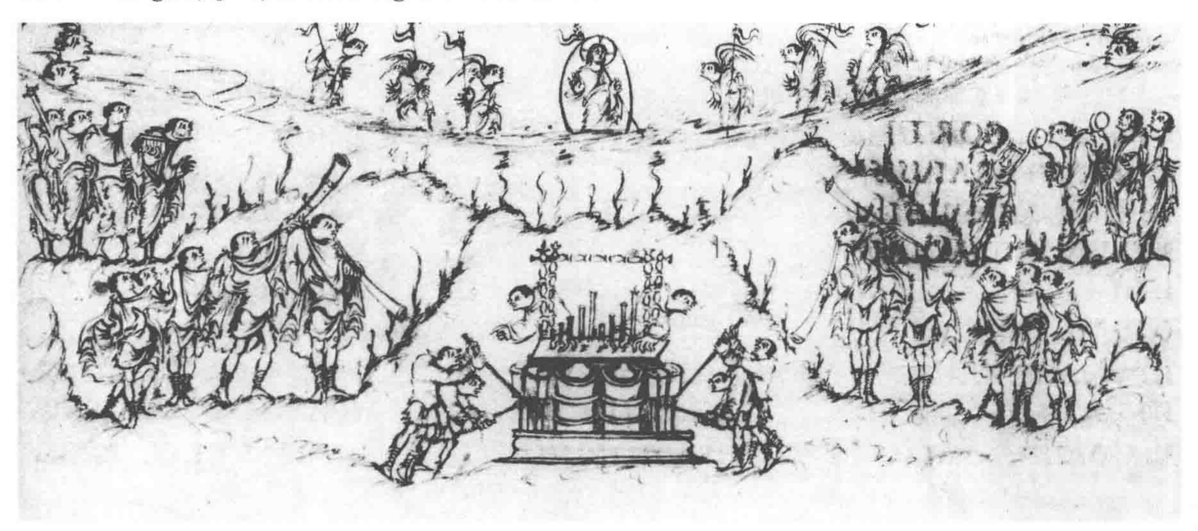
23. Remains of a Roman organ, 228 CE, *found at Aquincum (Aquincum Museum, Budapest): (a) pipes; (b) sliders; (c) sliders in position*

Wooden keys operate perforated sliders rather than pallets. E.L. Szonntagh's analysis (D(xvii)1981) appears to confirm that, although the wind-raising mechanism is missing, the Aquincum organ was a hydraulis, rather than a bellows-blown organ. Each set of pipes can be played separately from the others, and Walcker-Mayer (D(i)1970) theorizes that the four ranks of pipes were tuned according to four separate modes. Further research on this theory is necessary, but if the four registers of the Aquincum organ did in fact produce modal scales based on different pitches, the knowledge will have significant impact upon the understanding of the later development of modes, scales and keyboards.

Reconstructions of the hydraulis suggest that it might have had a wind pressure anywhere between 7·5 cm and 30 cm; also unknown is whether the pipework was always flue and, if so, whether the diameters were constant. While written sources give no firm evidence, iconography seems to suggest that: the pipes were usually flue; their diameter was constant; the tuning (in the more complete examples) was probably multiple, providing a choice of modes for rather less than an octave; and multi-rank chests may have provided different timbres with or without octave and 5th-sounding ranks. But none of these conclusions is reliable. The Aquincum organ supports the case for flue pipes, contradicts the suggestion that the diameter was constant, and leaves the tuning and timbre uncertain.

2. The Byzantine organ. By the end of the 5th century the new Roman Empire of the east, with its base at Constantinople, had achieved a character of its own, intellectually conservative and favouring a world of abstract thought far removed from the practical technology of ancient Alexandria and Rome. Although the old Greek treatises were preserved in Byzantine copies and hence known to the Arabs, engineering projects like organ making remained undeveloped for a millennium. But by the 8th century western Europe itself no longer knew such masterpieces of Roman engineering as the Vitruvian hydraulis. All the sources suggest that the European 9th- and 10th-century 'organ revival' came about because the instrument was reintroduced from Byzantium.

Despite some hints in the sources, the organ was certainly not used in the Byzantine Church itself (and indeed is still not except occasionally in churches in the USA). But at least two facts seem to be clear: that most references relate to bellows-organs, and that the instrument continued to be part of the secular, courtly pomp in the capital city. In the first connection, a 10th-century Arabic source suggests that three (or two) bellows fed air into a large reservoir below the pipe-chest; in the second, it was no doubt because of their use at banquets, chariot races, weddings, processions and the like that organs were decked out in gold and costly decoration. Both the 'blue' and 'green' factions at court had an organ, but the instrument otherwise remained a rarity. At his palace the emperor had both automata (the famous 'golden tree' with moving, whistling birds activated by bellows; fig.24) and true organs in which at least one emperor (Theophilus, 9th century) took an interest. Nothing is known of the pipework, sound, compass, precise function or repertory of the organ in the Great Reception Room, or indeed anywhere else, though one 9th-century source does refer to '60 copper pipes' in what appears to have been a large table-organ.



24. Byzantine automaton 'golden tree', with whistling birds activated by three pairs of bellows: drawing after a 12th-century MS from St Blasien, published by Gerbert in his 'De cantu' (1774)

Organs became objects of visual and aural show, eliciting wonder and respect as diplomatic gifts or signs of royal power. In 757 a famous diplomatic instrument was sent to the Frankish king Pepin at Compiègne. A monk of St Gallen (possibly Notker Balbulus) reported that the 'King of Constantinople' also sent an organ to Charlemagne in 812, with bronze pipes, 'bellows of bull leather' and three sound effects (rumbling thunder, trembling lyre, tinkling *cymbali*), possibly suggesting *pleno*, flutes and little bells; but the source is doubtful, the language being somewhat hyperbolic (or possibly psalmodic). In any case such instruments were not church organs but extravagant gifts, like the 13th-century organ of 90 pipes sent from one Arab court to the Emperor of China.

An event of evident importance in the 9th-century chronicles was the arrival at Aachen in 826 of Georgius, a Venetian priest who undertook to construct a hydraulis. According to a poem glorifying Charlemagne's son Louis, Georgius's organ was a kind of royal or national symbol of power: 'The organ, not seen in France before, a subject of pride for the Greeks, the only reason the people of Constantinople felt themselves your master: even the organ is now represented in Aachen'. Its intricate technology must have been the justification for such respect. The Aachen organ was used for occasions of pomp, not for chapel services; the Utrecht Psalter (compiled in France, perhaps near Reims) depicts, with little understanding, a hydraulis taking part in an ensemble illustrating Psalm cxlix (fig.25); this too has little to do with church services, being merely symbolic, or perhaps depicting some sort of 'signalling' organ.

3. The organ of the Arabs. The high level of Arabic and Islamic culture from the 8th century to the 10th gave theorists and craftsmen the opportunity to work on

25. Hydraulis (centre) with horns, cymbals, lyres, a psaltery and lute: drawing illustrating Psalm cxlix from the Utrecht Psalter, 816–34 (NL-Uu 32, f.83r); possibly after a model from 5th- or 6th-century Alexandria or Byzantium

bellows-organs; theorists in particular knew of such 'instruments' but seem rarely, if ever, to have seen one. A famous source, the Epistle to (or from) Muristus, describes two organs, one of which is a kind of siren or signal-organ; the sources containing Muristus's writings are also interesting in that two of them (in Beirut and in the British Library) show how a diagrammatic plan can become, under the scribe's hand, an unintelligible pattern of abstract design.

Nothing is known of Muristus, and the graphic similarity of his name in Arabic to Qatasibiyus (Ctesibius) was pointed out by Farmer (D(i)1931); Muristus appears to have been a Greek (or Byzantine), and in any case derived his descriptions of instruments directly from Ctesibius's *Commentaries*. But neither of them is a true organ. The first contains a chest of 12 pipes fed with wind from the lungs of four men blowing through tubes into a regulator; the weight of the pipes compresses the wind; the pipes themselves appear to be reeds, all of the same length but of varying diameter and requiring different volumes of wind; the wind is admitted to each pipe through a valve, presumably one worked by some kind of key. This seems to be the instrument of 'formidable power' referred to in the 'Letter to Dardanus' once attributed to St Jerome. The second or 'Great' organ is a signal-organ perhaps not unlike the (smaller) *magrepha* and containing a siren pipe or pipes blown at great pressure, used in battle by the Greeks, according to Muristus, or for similar purposes by other Middle Eastern peoples. The siren worked on the same principle as the hydraulis, four pumps or cylindrical bellows providing wind pressurized by water in a cistern.

There is no evidence that the organ became known again in western Europe through the cultural activities of the Arab caliphate of Córdoba in Spain. But the possibility that this might have been the case adds further importance to any work undertaken on this period in Iberian musical history, for links may perhaps be discovered between Spanish–Arab instrument making and 9th-century Benedictine musical life. In the eastern caliphates organs seem to have developed into mere ingenious automata; but even in that state the Eastern organ seems not to have survived the fall of Constantinople in 1453.

4. Early church organs. The gift organs of the 8th and 9th centuries were Byzantine organs, called 'organum' in the chronicles and still perhaps regarded as an 'engineering contrivance' rather than musical instruments. The fanciful clock given to Charlemagne in 807 by an envoy of the Persian king was Arabic; the Venetian priest Georgius, sent to Aachen in 826, was possibly trained in Byzantium. Several Western writers from the 8th century to the 13th knew of the Greco-Roman organ but in most cases from vague written sources from which even the more astute authors got the impression that the pipes were made to sound by water rather than by air – an idea sustained by the Jesuit amateur physicists of a later century. The well-known picture in the Utrecht Psalter (fig.25) of a hydraulic organ with two players and four alternating pump blowers is also based on a misunderstanding of the Mediterranean hydraulis. Many of the early church writers refer to organs in such hyperbolic or apparently unreal terms that their sources of 'information' must have been in most cases literary. It is even possible that such references to organs with 100 pipes, like that of St Aldhelm, were mistaken allusions to *hydra*, the 100-headed monster whose name is the same as a documented abbreviation for the hydraulis. All ecclesiastical references to organs before the 10th century are to be treated with caution, and even scepticism.

All these organs were secular. One of the great unsolved puzzles of music history is how and why the organ came to be almost exclusively a church instrument in western Europe from about 900 to about 1200. The early church was subject to two particular influences against any instrument in church, and especially in the liturgy: the liturgy's origins in the Jewish synagogue, and Patristic resistance to anything of profane or luxurious association. By the 9th century, however, the intellectual and liturgical style of the church had changed. Like sung organum, the instrument owed a great deal to Benedictine cultural centres, not only in their literacy and scholarship but also in the opportunities which their large churches gave to the advancement of music. The monastic revival in the late 10th century must itself have been a factor in the appearance of organs, which had become ingenious objects for the use of the clergy, not the people. The organ

was never officially approved or even acknowledged in any known papal or pontifical document despite the traditional legend that Pope Vitalian (657–72) introduced it. Nor, for one reason or another, are any of the references to organs placed or used in church before the 9th century at all reliable.

Organs, like tower bells later, were one of the irrelevances complained of by the new reformed order of the Cistercians, judging by remarks made by St Aelred, abbot of Rievaulx in 1166; his reference to the sound of the bellows, the tinkling of bells and the harmony of organ pipes is highly reminiscent of older reports. St Aelred also referred to the crowd of people watching this display as if in a theatre, 'not a place of worship', which suggests that organs were placed inside buildings, perhaps for example a large Benedictine church. But all this does not necessarily indicate that an organ was used during the service, nor even before or after the service. Perhaps it was rather an object of curiosity, like a cathedral almanac clock. Other 12th-century sources imply more clearly that an organ was used in some way during the services, perhaps for signalling purposes, like bells at the Elevation.

Whether organs were used liturgically is not clear from the many 9th- and 10th-century references to them. The notice describing the consecration in 972 of the Benedictine abbey of Bages, Spain, for example, makes it clear that an organ played near the entrance, 'praising and blessing the Lord'; but to surmise more is conjecture. Much the same could be said for the archiepiscopal coronation at Cologne Cathedral in 950. Pope John VIII (872–82) wrote of an organ required 'for the purpose of teaching the science of music', for which it remained useful to scribes writing about and teaching musical proportions, for example at Benedictine centres such as Fleury and St Gallen. The practical function of organs set up by, or in memory of, great abbots or landowners is unknown; reference to organs used on feast days (e.g. in the Life of St Oswald, 925–92) suggests if anything that they were extra-liturgical, a kind of church carnival object. The Benedictine abbot Gerbert (Archbishop of Reims, 991–5) was said by William of Malmesbury to have had a hydraulic organ put into the cathedral: an object of mechanical ingenuity, once again coupled with a clock in the written account. Gerbert may have learnt the principles of the hydraulic organ from the Arabs in Córdoba, where he lived for a time, since Benedictine manuscripts of the period do not suggest any practical familiarity with the writings of Hero or Vitruvius. Nothing is known of other 10th-century organs, such as that set up in Halberstadt Cathedral under its Benedictine bishop Hildeward; nor are contemporary references such as those of Notker Balbulus (*d* 912) helpful towards an understanding of the nature and purpose of organs. So many of these writers were merely indulging in metaphor.

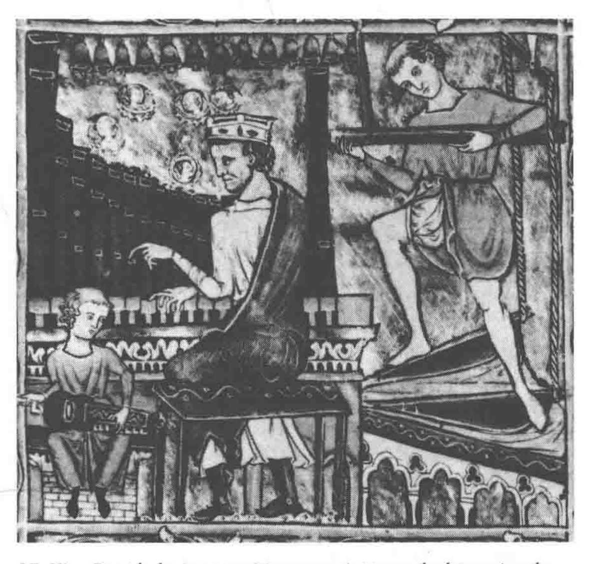
One detail of the Bages consecration of 972 was that the organ music 'could be heard from afar', which may or may not imply that the organ was outside the church. But a large number of references, second-hand or glossed though many must be, suggest that the organ was a loud instrument by standards of the day. Is it possible to see the famous organ from the late 10th century in Winchester Cathedral as a signal-organ, used on feast days to summon the congregation or overawe them (perhaps before or after services)? This does not preclude its having keys and some musical potential; 'signal-organ' simply describes its loud tone. If the Winchester organ was placed near the west or south door (stone screens were not known until the next century, and at Winchester only the nave may have been capacious enough) its use could hardly have been liturgical. Nor is it easy to see how an organ could have been liturgical in a much partitioned church of the type known to the later Cistercians.

The Winchester organ was built by about 990, some decades after the Benedictines were fully established there and later than modern commentators have said. Details of it appear in a fanciful verse letter written shortly afterwards by the monk Wulfstan. Much quoted, much translated and much misunderstood, the poem speaks of 26 bellows and 400 pipes in ten ranks, with the 40 notes arranged as two sets of 20 keys played by 'two brethren of concordant spirit' (see *BicknellH* for an up-to-date interpretation). Each key was a perforated slider pushed in and probably pulled out – hence the need for two or more players. Clearly some kind of organ did exist; but there are good reasons for distrusting Wulfstan's account: despite the fanciful references by St Aldhelm to what appear to be 100- and 1000-pipe organs, there are no other firm details extant of such large organs, at Winchester or anywhere else; the numbers given for bellows, blowers (70), pipes, ranks and keys are not plausible, whatever the diameter of the pipes and however the wind was raised (even the number of players smacks of literary tradition or at least of the poorly drawn hydraulis in the Utrecht Psalter); the general style and character of Wulfstan's poem are those of an impressionable layman not concerned with technical accuracy (for further details see McKinnon, D(xii)1974).

Three 11th-century sources are rather more practical than many later medieval manuscripts (see §5 below). *De diversis artibus*, a large encyclopedia written in the first half of the century by the German monk Theophilus, describes techniques used in making church objects – glass blowing, painting, gilding, metal forging, bell casting and organ making. The sources of his treatise leave its authenticity uncertain, the last part of it probably being a later compilation. A second 11th-century treatise is the anonymous Berne Codex, a manuscript possibly originating at the Benedictine abbey of Fleury; a third is a note by Aribo on pipe making.

Theophilus's organ (see fig.1) could be mounted within a recess in an interior wall, presumably at gallery level, with only its chest and pipes visible from the church and these indeed covered by a cloth 'tent' when not in use. Later 13th-century screen organs would have been equally well placed, in some cases better placed, when they came to serve as *alternatim* instruments in the liturgy. Many details of Theophilus's organ are unclear, not least its function in the church. Theophilus first advised his reader to obtain a treatise on pipe measurement (*lectio mensurae*), which would presumably contain a table of concrete values or actual pipe-scales, rather than mere Pythagorean ratios. The copper for the pipes was first to be beaten very thin, then shaped around a gently conical mandrel, which suggests that foot and resonator would be all of one piece, having the shape of a modern Trumpet resonator; pipes of this shape are in fact depicted in some iconographic sources (figs.26 and 27). The Berne Codex seems to suggest a more familiar type of pipe-foot, and gives 'almost 4'' as the longest pipe, but does not indicate the length of the foot unit. Theophilus's pipes are equal

26. Organ with sliders and a conflatorium: drawing from the Bible of Stephen Harding, French, completed 1109–10 (F-Dm 14, f.13v)



in diameter, which may not be unreasonable in an organ of less than two octaves. In the 1980s Louis Huivenaar and Jan de Bruijn constructed conical pipes of the kind described by Theophilus, placing them on a chest based on Zarlino's 1558 description of a chest from Grado, Venice, believed to date from the 11th century, having 15 keys, two ranks of pipes, and spade-shaped keys not unlike those in fig.27. This experiment suggests that the conical pipes had a strong and complex overtone content, producing an extraordinary vocal quality and seemingly well suited for playing a chant melody.

In his section on forging Theophilus described bellows, and from other sources of the period it seems that such bellows were large, capacious, and planned to compensate for leaks between feeder and pipe. The feeders direct wind into a *conflatorium* or receiver, shown in some 11th- or 12th-century miniatures such as the Harding Bible (fig.26) and Cambridge Psalter. In the Berne Codex the valve preventing the return of wind when the bellows are refilled is placed in the collector, while Theophilus's valve is in the head of each bellows. The main duct can be curved or straight (but perhaps not mitred) and is usually shown as generously proportioned. The keys of the Berne Codex organ closely resemble Hero's, consisting of a 'square' depressed at one end, pushing in a perforated slider (to which it is attached) at the other, and pulled back by a horn-spring to which it is tied. By the 13th century, according to a miniature in the Rutland Psalter (fig.27), organists were using their fingers separately (and rather elegantly) to depress the keys, which in this miniature were broader and more substantial than some reproductions of it suggest.

5. Medieval organ theorists. In the absence of any known organ remains between the 3rd-century organ of Aquincum and the (?) late 14th-century positives of Sweden (see §6 below), historians must turn to the body of 'medieval organ pipe theory', readings of which have led to some misleading ideas about medieval organs. The many sources have been seen as 'treatises on organ building' (Frotscher, D(i), 1968; Mahrenholz, C1938; Fellerer, D(i)1929) or 'treatises on pipe measurement' (Perrot, D(i)1965); but after 1966 researches into the now completely collated texts (see K.-J. Sachs, C1970–80) have led to a new assessment of their purposes.

The texts, in some cases only a few sentences in clerical Latin, fall into three main categories. The largest group (about 30 texts in 155 sources from the 10th century onwards) are those concerned with the length of organ pipes calculated by ratios from an 'initial' pipe, itself of no specified length; most of the length measurements take account of End correction which, in the case of a row of pipes of the same width and mouth shape, is constant. A smaller group of texts (11, in 11 sources) is concerned with the width or diameter of organ pipes, ignoring end correction in calculating the length; some of these discuss the relationship of mouth width, cut-up and foot-hole to the pipe diameter; none dates from before the 14th century. Neither of these two groups covers the whole subject, since in fact variable pipe-widths and quasi-Pythagorean demonstration of end correction are mutually exclusive. The third group of texts (three only, all 11th-century) deals with technical pipe making. These texts are Theophilus's *De diversis artibus* (bk 3, pp.81ff), *Cuprum purissimum* (the Berne Codex), and the section 'Sicut fistulae' on pipe making from Aribo's *De musica*. Some aspects of the organs described in this last group of sources have received attention in §4 above.

The 'pipe-length treatises' rarely offer concrete usable measurements, nor do they outline any pattern of values in which practical experience may have had a hand. Instead, the scalings concern proportional values corresponding to the Pythagorean ratios known from monochord theory. On the one hand, it is obviously possible to make an organ without determining the acoustical

27. King David playing a positive organ (apparently depressing the keys with separate fingers), with a symphonia (hurdy-gurdy) and cymbalum: miniature from the Rutland Psalter, English, c1250–60 (GB-Lbl Add.62925, f.97v)

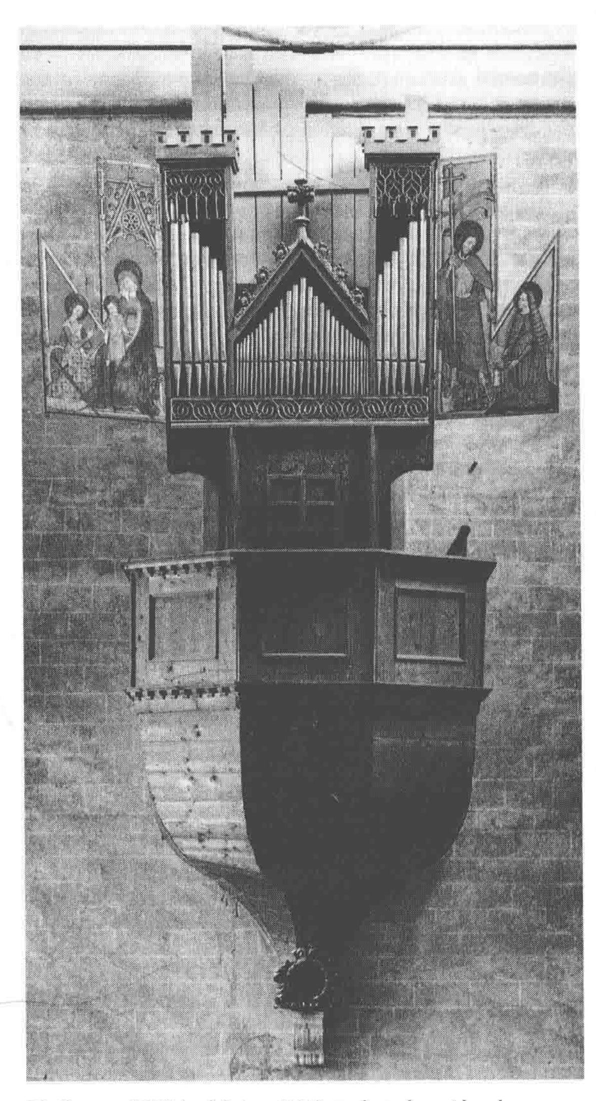
phenomenon of pipes; on the other, no careful measuring of pipes leads to usable pitches without proper tuning. Many treatises so resemble the numerous scaling texts for the monochord and *cymbala* that the significance of their pipe-scalings should not be interpreted in isolation; for pipes, strings and bells might have been cited primarily as examples of Pythagorean ratios according to which a pipe approximately half as long as another will sound the octave above, one approximately two-thirds as long the 5th above, and so on. Comprehensive instruction treatises covering such matters include the works of Notker Labeo, Aribo, Engelbert of Admont, Hieronymus de Moravia, Walter Odington and Giorgio Anselmi; an important branch in the tradition was the widely known *Scolica enchiriadis* of the late 9th century. In no way were such sources recipes for making instruments; rather, they outlined the kind of number theory which theorists since Boethius had applied to music.

Both Theophilus and the writer of the Berne Codex were dependent on ancient accounts, namely those of Vitruvius and Hero. Aribo's account probably refers back to a manuscript tradition around the uncertain figure of Wilhelm of Hirsau, who seems indeed to have been concerned with actual pipe measurement. Most of the copies of a text ascribed to him are provided with drawings showing the scale of the first pipe (not unlike the measure line in Schlick's *Spiegel*, 1511). But in other writers, end correction, the very factor 'disturbing' the neat theory of Pythagorean ratios, was itself determined proportionally, calculated as a fraction of the diameter. For such calculation the diameter was assumed to be constant; hence the frequently repeated conclusion that the medieval organ builder made a rank of pipes all to the same diameter. Optimistically interpreted iconography has been seen to support this idea. But it should be remembered that the general medieval approach to making things (i.e. before print technology brought craftsmen gradually to depend on visual models) weighs against the practical significance of written-down treatises. Only two of the texts cover organ building as such, and they are partly derived or even (in the case of Theophilus) the result of a compilation. Moreover, practical details such as the remark in the Berne Codex that pipes follow the modern diatonic genus ('si ... sit diatonicum genus quo maxime decurrent moderne cantilene') do not necessarily indicate an actual organ such as might be used in liturgical music. The Sélestat manuscript (11th century) and the Berne Codex describe pipe-chests of seven notes, and the former seems to make it clear that its three ranks are unison, octave, unison; at the same time, an 11th- or 12th-century miniature, in the Harding Bible, shows a keyboard of C, D, E, F, G, A, B♭, B♮, a set of keys showing one each of the known notes (see fig.26). But it is not known whether these treatises and miniatures reflect more than certain literate, second-hand and even non-empirical traditions passed on, perhaps indirectly, to their scribal 'authors'.

6. The church organ, 1100–1450. Rarely in music history is conjecture taken more confidently as fact than in this area. Despite bold and apparently plausible modern assertions that playing in 4ths and 5ths was known by 9th-century clerical organists, that *alternatim* chants were known in the Mass during the 11th century, or that large organs played the *puncti organici* (and even the quicker upper parts or *voces organales*) in the Île-de-France organa of the 13th century, there is no irrefutable evidence to support them. It may be reasonable to assume that in the larger Benedictine abbeys (St Gallen, Metz, Benevento) polyphony, organ playing and troping of plainchant were all linked; but it is not known during which century the more cosmopolitan of the abbeys may have begun to use the organ more integrally during Mass than they were ever to use their other expensive mechanical equipment such as bells or clocks. Nor are technical matters concerning the structure of organs any more certain. There is no evidence that, between the 10th and the 12th centuries, octave- and 5th-speaking ranks were used in abundance, or that reed and stopped pipes were also known, as more than one modern writer has claimed. Much later still, basic assumptions are unreliable. Iconography by no means establishes that organists had to use all of each hand to thump the keys, at this or any point in organ history. Nor are archives less equivocal; church accounts do not prove that the 'little organs' sometimes mentioned from about 1390 onwards were second manuals of large organs or that, if so, such manuals were placed together or had the same pitch. The use of multiple organs in large churches is well documented from this period onward, and the 'little organs' usually prove to be separate instruments from the 'great organs'. Possibly the second keyboard, up until at least the time of the Innsbruck Hofkirche organ (1550; the oldest extant two-manual organ), should be seen rather as an extension to the compass of the first. Organ research from about 1960 has been directed towards a circumspect interpretation of the evidence, and a new period of re-examination concerning the evolution of the organ is inevitable.

Certainly the period 1100–1450 was one of great activity. During the 11th century more organs are known to have been in monastic churches throughout western Europe; they were played at ceremonies (probably outside the liturgy) and succumbed to the fires that frequently swept medieval cathedrals (Canterbury 1114, Freising 1158, Merseburg 1199) – which suggests perhaps that they were fixed in place. Some literary sources imply that the organ was played during Mass, for instance the *Roman de brut* (*c*1155, Normandy):

> Quant li messe fu commensie ...
> Mout oissiés orgues sonner
> Et clercs chanter et orguener



– but such references are vague and merely image-evoking; poets' sources were usually other poets. More authentic sources of the 9th and 10th centuries suggest, however, that sequences as well as the *Te Deum* were the most open to polyphonic vocal treatment, just as later they were the movements most closely associated with the organ. A small portative and a psaltery are shown in a 12th-century miniature but no ecclesiastical function is implied, any more than for the portatives illustrating psalms in earlier psalters (e.g. the small organs hanging on willow trees at Psalm cxxxvii in the Stuttgart Psalter, 10th century). But by the 13th century all instruments other than the organ were excluded from various churches in Spain, Italy and France. The phrase 'great organs' is found in church documents (e.g. Erfurt Peterskirche, 1291), and by 1296 one French bishop referred to the organ sounding five times in connection with the Sanctus – perhaps as a signal rather than for music as such. There is no evidence that it played the tenor in Sanctus movements or in any motet following at that point during

Mass. But by the end of the 13th century secular cathedrals from Exeter to Prague, Barcelona to Lübeck, were as likely to have organs as the larger abbey churches. Whether erected on screens (as in England) or hanging on an upper wall of nave or quire, the organs were usually located near the *cantores*, i.e. no longer near the west or south entrances nor specifically near the main altar. It is not known, however, when large organs were fixed in Theophilus's manner, and illustrations for psalm texts usually show much smaller organs in ensemble. The phenomenon of the smaller fixed organ attached to, associated with, and in some cases paid for by specially bequeathed chapels belongs to the 15th rather than the 13th century.

The large organ seems to have been an exclusively ecclesiastical instrument from the 9th-century Western Church to 17th-century Italy. Probably by the late 13th century the cathedral or abbey organ was occasionally used in *alternatim* music with the *cantores*, though presumably not with the congregation itself. Jovannes de Florentia referred (*c*1350) to performance 'partim organo partim modulatis per concentum vocibus'. Early 15th-century keyboard repertory extant in the Faenza Codex (*I-FZc* 117; *see* SOURCES OF KEYBOARD MUSIC TO 1660, §2(i)) complements such explicit references as the mid-15th-century Castilian rubric 'the organs played one verse and the clerics sang the other'. 14th-century documents usually suggest that whatever the organ played, it did so on traditional church or local feast days, for example at Halberstadt Cathedral on Christmas Day, for Easter Week, Sunday after Easter, *Kreuzerfindung*, Reliques of St Stephen, Ascension, St Peter and St Paul, Dispersal of the Apostles, Mary Magdalene, St Stephen and St Sixtus, Assumption, Patron, Nativity of Mary, St Michael, St Gall, All Saints and 12 other feast days including Trinity and Annunciation. For three centuries organs were used only on feast days. But by the end of the 13th century some churches had decreed against other instruments (Milan, 1287); by the 14th, *alternatim* performances took place, especially in the Office; by the early 15th, many areas, such as the Upper Rhineland, north-central Germany, some English and Italian cities, and the stretch from Rouen to Utrecht, had organs in most of their larger churches, and the future of the instrument was completely assured.

It is impossible to trace this history step by step, despite a certain amount of archival, musical and iconographical evidence. But certain general points can be made about the 14th and early 15th centuries. Organs became known in cathedrals less as an exception and more as a norm; by 1425 the large positive (with front pipes arranged from left to right) was usually distinct from the fixed church organ (with front pipes in mitre form with a set of larger pipes to each side, thus requiring a rollerboard). All the evidence suggests that only open metal flue pipes were known, though some commentators have seen such references as 'plom ... per las horguenas' (church of the Cordeliers, Avignon, 1372) as evidence that lead pipes were used for distinctive tone-colour; lead was in fact the most common pipe metal in all countries during this period. Larger organs in certain areas (Normandy and later the Netherlands, possibly England also) occasionally had Trompes during the period 1390–1450 (i.e. a set of ten or so large open metal Bourdon pipes, possibly played by a separate manual or pedal keyboard and placed to one side, or both sides, of the main organ). Presumably they also had a BLOCKWERK, although apart from the number of pipes in a few famous examples (e.g. 2000 at Amiens in 1429) little is known in this regard before 1450. Presumably the pitch of their compass, whether from (apparent) *B* or any other note, was roughly equivalent to men's voices, the total compass perhaps divided up and distributed over more than one keyboard. However, so many significant unknowns are raised by such summaries that describing the church organ before its more clearly defined types of 1450 is mostly a matter of citing facts about individual instruments.

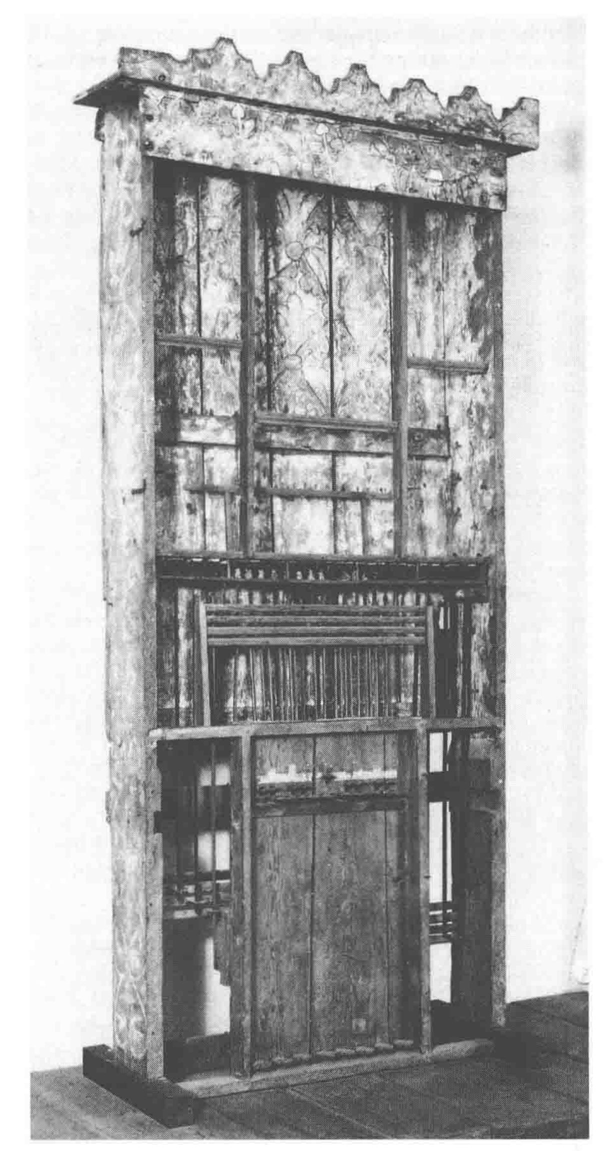
The organ at Sion, Switzerland, is usually dated about 1380 (although it may in fact be later) and has been much rebuilt. Despite opinions expressed on its tone, and although some of the original pipework seems to be incorporated in the present organ, nothing is certain of its original sound, disposition, compass, pitch, voicing, pressure, bellows, position, purpose or provenance. Nevertheless, its case (fig.28) shows interesting elements:

28. Organ, c1380 (pedal pipes 1718), perhaps from Abondance Abbey (Savoy), now on the west wall of the collegiate church of Notre Dame de Valère, Sion

it has the typical shape for such instruments, with the central mitre lines (like Arnaut de Zwolle's organ at Salins); the castellated 'towers' to left and right overhang the sides; and the wings (painted and perhaps made about 1434–7) enclose the pipes completely. At Bartenstein in East Prussia parts of an organ dated about 1395 existed before World War II. The organ had a large chest for 27 keys (?*FGA–a′*) with three divisions for a large chorus of nine (bass) to 21 (treble) ranks, case-pipes of 16′, and Principals 8′ + 4′. An ingenious reconstruction of the chest was sketched by Karl Bormann (D(xv)1966) but little is certain, particularly the stop mechanism whereby wind was admitted to chorus and principals at will; perhaps the device was made not in 1395 but one or two centuries later. The organ at Norrlanda (*c*1380), now pipeless and in the State Historical Museum, Stockholm, is a large positive with a putative *Blockwerk* of three to six ranks. A set of 12 rollers conveys not only both pedal and manual key-travel to the larger pipes held in small side towers but also the action of certain pairs of keys (*C*♯/*c*♯, *D*♯/*d*♯, *F*♯/*f*♯, *G*♯/*g*♯) to a single pallet. This is so sophisticated an arrangement, not least in its resulting chromatic keyboard of nearly two octaves (*C–a* or *c–a′*; fig.29; for a close-up view of the keyboard, *see* KEYBOARD, fig.1), that doubts too must arise about the age of the organ – which in any case appears to have case-work constructed out of panels from some older choir stalls. An organ of surprisingly similar appearance is depicted in the mid-15th-century stained glass of the Beauchamp Chapel, St Mary's, Warwick.

Extant 12th- and 13th-century church accounts merely record the presence of an organ; about many areas of Europe, curiously little is known. Only during the 15th century were the great Gothic churches of some areas constructed (e.g. in the Netherlands), but many were immediately provided with an organ as part of the regular furniture. The first real details of church organs occur in such documents as builders' contracts from about 1390 onwards, when for reference purposes the anonymous scribe would distinguish the 'opus maius' from the 'parvum opus organum' (Utrecht Cathedral, suggesting either two separate organs or an organ with a *Rückpositiv*) or the 'principaulx' pipes from the Bourdons (Rouen Cathedral, suggesting Trompes and other major Fourniture ranks), or even by 1420 'cinch tirants', suggesting five separate stops in a large positive (Aragonese royal chapel). Otherwise it was enough for an organ to be entrusted to the craftsmen concerned, who had merely to see that it was 'decent, good and to the honour' of the church (S Giovanni Evangelista, Venice, 1430).

Henri Arnaut de Zwolle, writing in the 1440s, described several organs he knew, including those at Salins (*c*1400, *Blockwerk* of 6–15 ranks) and Dijon (*c*1350, 8–24 ranks); an account of his treatise is given below (§V, 1). The most famous 14th-century organ is that of Halberstadt Cathedral (*c*1361, rebuilt 1495), described in some detail by Praetorius (*Syntagma musicum*, 2/1619). The four keyboards were as follows: I, called *Diskant* by Praetorius, playing the *plenum* (case pipes + Hintersatz Mixture; *see* FULL ORGAN), *B–c′* (14 keys); II, also called *Diskant*, playing case pipes (Prinzipal) only, same compass; III, called *Bassklavier*, *B–a* (12 keys, long protruding levers perhaps worked by the knee, playing the 12 large bass pipes); IV, pedal keyboard, same compass as III, used with (perhaps pulling down the keys of) the top manual. The largest rank of pipes was at the equivalent of 32′ pitch, the total number about 1192, from 16 ranks at pedal *B* to 56 at top manual *a′*.



Praetorius by no means understood the historical nature of such old organs, nor is it clear from his report what in the Halberstadt organ dated from 1361, what from 1495. But it is probable from his account that the *Blockwerk* had multiple ranks of octaves and 5ths such that the manual disposition was approximately as follows:

B-e 16.16.8.8.8.5⅓.5⅓.5⅓.5⅓.4.4.4.4.4.2⅔.2⅔.2⅔.2⅔.2⅔.2⅔.
2.2.2.2.2.2.1.1.1.1.1.1
f-c′ 16.16.8.8.8.8.5⅓.5⅓.5⅓.5⅓.5⅓.4.4.4.4.4.4.2⅔.2⅔.2⅔.2⅔
2⅔.2⅔.2⅔.2.2.2.2.2.2.2.1.1.1.1.1.1.1.1.1
d′-a′ 16.16.8.8.8.8.8.5⅓.5⅓.5⅓.5⅓.5⅓.4.4.4.4.4.4.4.
2⅔.2⅔.2⅔.2⅔.2⅔.2⅔.2⅔.2⅔.2.2.2.2.2.2.2.2.
2.2.2.1.1.1.1.1.1.1.1.1.1.1.1.1

From the details given, the pitch level seems to have been *a′* = *c*505. Praetorius also described the sound of this *Blockwerk* (*see* BLOCKWERK). 20 bellows supplied the wind, all presumably needing to be operated for the *plenum*, though his drawing shows only two operators (*see* KEYBOARD, fig.2).

Praetorius gave other details about organs he described as old, and his suggestions could be the starting-point for organ historians. For example, he guessed that semitones appeared in keyboard compass from about 1200 and pedals from about 1220, that by 1450 only open pipes were known, but that spring-chests had been built by about 1400 and separate stops by about 1250. The first date is late by two centuries if it is a question of B♭ only, perhaps a reasonable guess if intended to refer to the first *ficta* semitone (i.e. other than B♭), but early by at least one century if all five semitones were meant. The date for pedals must be about a century too early. The date for open pipes is probably correct, and that for spring-chests could be correct but is probably a little early. The date for separate stops seems early by at least two centuries if it refers to a full-size church *Orgelwerk*. Other details given by Praetorius are more certain, for example that some keys were as broad as about 60 mm, that some keyboards had a compass of *B–f′* or *c–a′* (diatonic only) and the curious-seeming statement that some early pedals played only the bass notes. Obvious though the last may appear, the large Bourdons or 'teneurs' (Notre Dame, Rouen, 1382) may in fact often have been operated by a keyboard played by the hands or even by the knees. The term 'teneur' is evocative, but what it signifies is uncertain; perhaps the keys played the long notes of a vocal composition or an *Intavolierung*; perhaps 'teneurs' meant merely large pipes as distinct from small ('menus' at Rouen, 1382, 'Diskant' in Praetorius). Certainly the playing of a cantus firmus *en taille* on the pedals is a later speciality of the 16th century. But whatever 'teneurs' was meant to imply, builders of the period knew well how to fashion pipes of various sizes and scale, according to Praetorius.

At the end of the 14th century, then, a large organ within the area Rouen–Utrecht–Magdeburg–Orvieto might be presumed to have had a *Blockwerk* of anything up to 80 or more ranks with open cylindrical pipes of metal, played by a broad-keyed manual of 16 to 22 notes, possibly with a further keyboard playing Trompes with or without their own chorus mixture, and exceptionally with a second smaller organ in some way connected with the first. Smaller but independent organs may have had, by custom, a longer compass, smaller keys, and a

29. Positive organ, c1380, from Norrlanda (Statens Historiska Museum, Stockholm); now pipeless

Blockwerk of fewer ranks. Not enough is yet known for generalizations to be made about the organ of about 1390 outside the region specified above.

7. THE 15TH-CENTURY POSITIVE AND PORTATIVE. Although the POSITIVE and the PORTATIVE each form virtually separate subjects, they offer a useful gloss on organ history at this point because each demonstrates a striking uniformity unknown to the larger fixed organ, and each demonstrates the limitations of iconographical evidence. Portatives were small portable organs blown by bellows (often single but sometimes a pair) operated by one of the player's hands (usually the left), and played by his other hand on a keyboard of up to two octaves, composed often of touch-buttons; the instrument would have one rank of pipes arranged in one or two (very rarely three) apparent rows. Such are the highly detailed and prettily finished portatives depicted by such painters as Memling (three examples, that at Bruges being the clearest: for illustration *see* PORTATIVE) and the Master of St Barthélemy (two examples). Positives were blown by a pair of larger bellows operated by a second person (fig.30), and were played by both of the organist's hands on a more or less chromatic keyboard exceeding two octaves (usually beginning at *B*) and composed of short finger-keys; two rows of pipes would form one complete rank, often with Bourdon (or drone) pipes pitched in the bass, perhaps an octave below. Some portatives also had (shorter) Bourdon pipes. In all known cases the pipes were open and of metal; the scaling is progressive and the diameters diminish, at least in the better depictions; cut-ups often appear low and the scale narrow; unless chords of more than two notes were played, the wind supplied by the hand bellows must have been quite adequate, though presumably low in pressure.

That paintings always leave problems of interpretation may be demonstrated by one of the best-known of all organ paintings, the Van Eyck altarpiece at Ghent (1432). Despite the beauty and apparent precision of the picture, the pertinent section of which is reproduced in fig.31, there are several puzzles. The front pipes, though painted well, are not placed naturally; the tips of the feet rest right at the front of the chest top-board, while each pipe corpus, whatever its diameter, passes behind the supporting brace, itself, however, of constant thickness. The feet of the inner row of pipes are placed almost without depth of perspective, all exactly in the middle of those of the first row – despite the latter's perspective. Unless the keyboard ran no higher than appears (blocked by the player's hand and arm) the two rows of pipes must produce only one

30. Positive organ: engraving of an organist and his wife by Israhel van Meckenem (ii), late 15th century

31. Angel musicians with positive organ, harp and fiddle: panel from the Ghent Altarpiece by Hubert and Jan van Eyck, c1423–32 (St Baaf Cathedral, Ghent)

rank; yet if the keyboard continued up symmetrically (as far to the right as the bass goes to the left) the organ would have at least 35 keys, implying a unique pipework of two non-chromatic ranks. The line made by the pipe-tops corresponds neither quite to a diatonic nor to a chromatic tuning, and the pipes in the bass seem unnaturally narrow in scale. Apart from these problems of depiction, the painting gives no information at all on certain points, such as the purpose of the latch-key on the lower left; if it is for a Tremulant, one might expect other evidence of the period for such stops; if it is a stop mechanism operating a valve to the rear chest, one must assume that there are other pipes not seen but making up the second rank; if it is a key to operate Bourdon or drone pipes, the pipes should be in evidence. Such questions can be answered plausibly enough, but only by conjecture, for comparisons with other instruments are too distant to be useful.

V. The organ, 1450–1800

While much research remains to be done for the beginning of this period, especially on developments in German organs of the area Mainz–Nuremberg–Innsbruck–Basle, a provisional historical sketch can be derived from Henri Arnaut's treatise and from certain documents relating to church contracts concerning organs of about 1450. From the 17th century onwards much more complete documentation is available.

1. The treatise of Henri Arnaut de Zwolle. Although concerned primarily with small organs, Arnaut's treatise (*F-Pn* lat.7295; ed. and facs. in Le Cerf and Labande, B1932) throws much light on the potential which organs were seen to have by 1450. The treatise was written in Dijon between 1436 and 1454, partly by Arnaut, a Dutch polymath at the Burgundian court of Philip the Good, and partly by two other authors or scribes. It reflects a lively cultural exchange between Burgundy, Paris and the Low Countries. Arnaut's remarks are more practical than those of any treatise since the 11th century. His description of an organ pipe is empirical and systematic; details suggest a scale some ten semitones narrower than *Normalmensur* at bass *B* but some seven semitones wider than *Normalmensur* at a hypothetical treble *b″*. The mouth width is about a quarter of the circumference ($\frac{2}{7}$ for bigger-toned pipes), the cut-up a quarter of the mouth width; the foot-hole diameter of a quarter of the pipe width was large, though easily reducible. From the measurements it is unclear whether Arnaut was working from two pitches of *a′* = c395 and *a′* = c435 or from a mean *tonus cori* of *a′* = c415. Two portative or positive chests ('ciste portivorum') are drawn and described. In one, a single rank of pipes for the compass *b*–*g‴a‴* is arranged 'ad modum mitre episcopalis' (i.e. like a bishop's mitre, tallest pipes in the middle); in the other, a rank for the compass *b*–*f‴* is arranged in the chromatic manner, tallest to left, shortest to right ('ciste communis' or 'the usual chest'). Arnaut also drew the front of a standard larger organ of the Sion type, probably the instrument at Salins (Salin, formerly in Burgundy), whose 4′ *Blockwerk* he later specified as *B* (6 ranks)–*f″* (21 ranks).

On f.127 of Arnaut's manuscript occurs the first incontrovertible reference in organ building to reed stops. On a page of scarcely 20 words (and ten figures) apropos the 'scales ... of the pipes in the church of the Dei custodientes' occurs the phrase 'l'anche de F', which apparently refers to the reed and block of a reed pipe. Arnaut seems to be saying that a rank of such pipes from

B to *b′* needs eight different sizes of block but gives no other details.

Of the organ of about 1350 in Notre Dame, Dijon, Arnaut noted that the pipes (*B–a″*) are already old and corroded; the pipe mouths were generally about half an octave too narrow, in his opinion. The Fourniture is mentioned, apparently the only separable part of the *plenum*. The total number of pipes in the organ was 768; the leather bellows (?*c*1350, ?*c*1440) had three folds and measured *c*160 cm by *c*70 cm. Arnaut also gave in tabular form the disposition of four different *Blockwerke*, one of *F* (8 ranks)–*e‴* (21 ranks), two of *B′–f″* (6 to 21 and 6 to 15 ranks respectively) and one of *B′*(10 ranks)–*a′b′* (26 ranks). The first has three categories (Principal, Cymbale, Fourniture), suggesting 'stops' made to play separately by two manuals or perhaps by some mechanical device (possibly a divided chest operated by a *Sperrventil*). The Principal 8′ has four ranks at the top and the Fourniture 14 (making 8.8.8.$5\frac{1}{3}$.$5\frac{1}{3}$.4.4.4.4.4.4.4.4.4); the Cymbale is nothing less than a three-rank *Terzzimbel*, indeed the first documented mixture containing a Tierce rank. The Cymbale repeats (i.e. breaks back to lower pitches), 29.31.33 at *B*, 8.10.15 at *e‴*.

One of the other three organs was apparently that at Salins, which had a long-compass 4′ *Blockwerk* of:

B′–E	8.8.15.15.19.22
F–B♭	8.8.15.15.19.19.22.22
B–e	8.8.12.12.15.15.19.19.22.22
f–b♭	8.8.12.12.15.15.19.19.19.22.22.22
b–e′	8.8.8.12.12.15.15.15.19.19.19.22.22.22
f′–b♭′	8.8.8.12.12.15.15.15.19.19.19.22.22.22.22
b′–f″	8.8.8.12.12.15.15.15.19.19.19.22.22.22.22

Even more important, perhaps, is that Arnaut's Fourniture is not an accumulative *Blockwerk* but a Mixture that breaks back to lower pitches in the upper octaves.

Arnaut referred also to the 12 'fistula[e] tenoris' at St Cyr (probably Nevers Cathedral), i.e. 12 Trompes or bass pipes, half as long again as the lowest ranks of the chorus. Unlike the other Principal pipes, these pipes had no accompanying Fourniture pipes of their own, and were thus presumably played from a separate keyboard and chests. At the church of the Cordeliers (?Dijon), the ten 'subdupla tenoris' pipes had a separate keyboard which could couple with that of the chorus, thus affording three effects: the usual chorus, the chorus + *tenor* or Bourdon pipes, or *tenor* pipes played by the left hand while the right hand played the chorus or *discantus*. It is unclear what Arnaut meant by 'double Principals' ('duplicia principalia'); did this mean that only the 8′ stop was doubled (two open ranks, or one open and one stopped rank), or that all ranks of the principal chorus were doubled? The reference to 'double principals' in the 1519 contract at All Hallows, Barking-by-the-Tower, London, is similarly obscure, although the recent discovery of two early 16th-century English soundboard fragments (analysed in *BicknellH*), strongly suggests the latter. If this is so, then 'Principal' in this context simply meant chorus or *plenum* – a hold-over from the earlier period when it referred to the *Blockwerk* (as at St Sebaldus, Nuremberg) – but with the exception of the 'bassys or diapasons' (corresponding to Arnaut's *tenor*, or the Flemish Trompes). The 'simplicia principalia' of the Dijon court chapel organ was described by Arnaut as 'in duo divisa', which may mean either one halved rank (with treble and bass stops) or the usual paired Principals separated off, perhaps by a slider. Two quints and an octave gave the organ a total of five registers, possibly with five push–pull slider-ends.

Further light is thrown on Chair organs ('tergali positivo'). Arnaut described one with 195 pipes, *FG–f″* at 4′ pitch and a four- to seven-rank *Blockwerk* of octave ranks only. The front pipes were of tin, the others of lead; the measurements of neither the mouths nor the foot-holes were systematic or regular in the particular Chair organ Arnaut was referring to, and he was puzzled as to why it nevertheless sounded well.

Though never completed, and although it appears to be more indebted to earlier writings than was previously thought, Arnaut's draft treatise stands as something unique in organ building, not least in its description of certain *Blockwerk* or *plein jeu* choruses. During the whole of the next century no source was to describe in such detail how an organ builder could plan his chorus. Contemporary documents, like modern histories, prefer to dwell on the new colour stops and other, essentially secondary, effects.

2. Developments, 1450–1500. Not only do Arnaut's remarks give a partial picture of the organ at this period, but contracts and other documents from other areas of Europe give corroborating details. Thus the organ at St Sebaldus, Nuremberg (by Heinrich Traxdorf, 1440–41), had Principal, Fourniture and Cymbale, perhaps of the type described by Arnaut. Such a division of the chorus became a kind of norm, not only at Nuremberg but also at the Florinskirche, Coblenz (1467), St Georges, Haguenau (1491), Weimar (1492), St Peter, Basle (1496), Leuven (1522) and in organs farther west. Yet it seems that the instrument of 1474–83 in S Petronio, Bologna, already had a large-scale, 50-note complement of nine single-rank stops (smaller in all respects than the organ as it now is), thus presenting a quite different tradition of organ building in the south.

Clearly the crucial questions are: how were stops separated, giving the organ different colours or effects, and why did builders of some areas give an organ several manuals while those in others concentrated on one manual? As to the second question, it can only be conjectured that southern builders learnt earlier than northern how to obtain musical variety from an organ with one keyboard, separate ranks and a long compass (e.g. the 53 or 54 notes at S Martino, Lucca, in 1473); and that northern builders, requiring only a few different effects (Diapasons alone, or the *plenum*), found that two or even three shorter or unequal keyboards with one or two registrations each were more useful and probably more powerful. Division of an organ into several chests was practical from the point of view of wind supply. As to the first question of how stops were separated, the situation is clearer. Several documents from the mid-15th century onwards refer to the varieties of sound achieved by a particular organ: Arnaut used 'registra'; references in church archives include 'registros' (Treviso, 1436), 'tirans' (Aragon, 1420; Barcelona, 1480), 'division de veus' (Perpignan, 1516), 'dreen gelueden' ('three sounds', Grote Kerk, Zwolle, 1447) and even 'a la moderna cum registri sei' ('with six stops in the modern manner', Catarro, 1488). How were these varieties achieved? 'Registers' and 'tirants' (even five 'registres sive tirans' at Avignon in 1539) certainly suggest slider-chests (see fig.3*b*). After all, the Roman organ of Aquincum had latitudinal sliders, and its keys admitted wind to the pipes

by these means. Longitudinal sliders running the whole length of a rank of pipes were different only in application, not in principle. However, when and where stop-sliders were first made is not known; no doubt they first appeared on small organs. A further system, the spring-chest (seefig.3*c*), was reintroduced in the Netherlands about 1520 to give greater reliability in larger organs, but was already known in Italy during the previous century: Orvieto Cathedral is said to have had an organ in 1480 with two spring-stops and two slider-stops. The most common 15th-century arrangement, particularly in the area from Rouen to Zwolle, was the 'double chest', useful especially for Chair organs. In such a chest the channels were divided into two parts, front (case pipes) and back (Mixture or Hintersatz), each with its wind box, the back one of which was provided with a shut-off valve allowing the Mixture to be taken off. Evidence for such chests is fairly clear from several Dutch contracts of the period (Zwolle, 1447; The Hague, 1487).

Much less clear is the origin of stopped pipes, although it is thought that the 'double Principal' of late 15th-century organs could imply an inner rank of stopped pipes sounding with the open case pipes, as well as multiple doubled ranks. 'Coppel' was a name used at first probably for case pipes (Limburg, 1471), later for stopped unison pipes (Bienne, Switzerland, 1517). Much the same may be said about the term 'Flotwerck' (Bassevelde, 1481). The 'lead pipes' for inner ranks referred to in contracts of many languages and areas have also often been assumed to be stopped pipes, but both documentary evidence and surviving Gothic pipework suggest that in many organs all interior pipework, including open pipes, was of lead. The Quintadena is a stopped metal rank sometimes referred to as *Schallpfeifen* early in the next century; it is possible that the emphasis on new organ colours at this later period was responsible for stopped pipes in general. Thus the stopped wooden Holpyp is authenticated from about 1500, but hardly before. Schlick (B1511) was still ambiguous about stopped pipes; even Flute stops at that period (e.g. Bordeaux, 1510) were open, as indeed they remained in Italian organs of a later century.

To sum up, in 1500 the average organ in northern Italy or southern France could be expected to have a chorus of ten or so separate stops, probably achieved with a spring-chest if the organ was somewhat large, with sliders if smaller; the upper ranks may have been duplicated here and there. Spain, at least in cities influenced by Flemish or 'German' builders (Barcelona, Valencia), followed more the transalpine organ. The bigger instruments of the Netherlands and Rhineland had two or even three manual departments, in most cases each with its own keyboard but all at the same (or octave) pitch. The English organ, judging by the All Hallows document of 1519–20 (see §8 below), was of the smaller Flemish kind: although it is possible that in secular or aristocratic circles Italian organs were known, all evidence points to the major influence in England being Flemish.

Some examples of organ schemes at their best before the turn of the century are shown in Tables 1, 2 and3. That such schemes were distinctly regional can be seen in a 1000-pipe instrument built by the German Bernhard Dilmano at Milan in 1464–6, probably a large northern organ of Principal, Mixture, Zimbel etc. The instrument was updated in 1487 but still had only eight separate

stop-levers in 1508. However, it is not known how many ranks of a native Italian organ of 1475 would be separate (as in later Italian organs). As to the sound of such organs, only conjectures can be made, even when much of the original material still exists, as it does at S Petronio, Bologna (conservatively restored in 1982). Although some contracts make it clear that specific sweetness or strength of tone was often required, much – perhaps too much – can be read into the use of words like 'lieblich' or 'süss' in early documentation.

3. ARNOLT SCHLICK'S 'SPIEGEL DER ORGELMACHER'. Against the background of the special effects demanded of new organs and promised to their clients by the builders, for example the Schwiegel, Waldhorn, Quintadena (*Scheelpipen*), Trumpets, Shawms, Zinks, Rauschpipe, Drums and 'other unusual stops' promised by Hans Suys at Antwerp Cathedral in 1509, Arnolt Schlick wrote a splendid, forthright little book on organs, publishing it in 1511 under imperial auspices and indeed apparently intending it as a kind of standard code of practice for organ builders in Maximilian's empire. Schlick lived in the central Palatinate court town of Heidelberg, and no doubt his influence was wide. The organ described in his *Spiegel* contained about 15 stops, 'not too many of the same type', as shown in Table 4. Schlick said that, in addition, the *Hauptwerk* might contain a Krummhorn and the pedal a Klein Octaff and Zymmel, but that the latter two do not belong there. All stops should be playable separately so that the pedal if required could take the cantus firmus. The Hintersatz should not contain the very low ranks of the 'large Mixture' (by which he may have meant the old *Blockwerk*), nor the 'low-pitched 3rds and 5ths' sometimes met with. There is little point in making separate $5\frac{1}{3}'$ stops, while the addition of various

TABLE 4

Hauptwerk
- 'die Principaln' (2- or more rank Principal)
- 'ein Oktaff einer langen mess' ('long Octave', or *doppel* if a large organ was required)
- 'Gemsserhörner ... kurtz weit moss' ('wide Gemshorn', an octave above the Principals)
- 'ein Zymmel' (Zimbel)
- 'Hindersatz' (large chorus mixture)
- 'die rauss Pfeifen' (Rauschpfeife imitating a shawm, ? i.e. a reed stop)
- 'hültze Glechter' (an unusual stop 'whose sound resembles that of small boys hitting a pot with a spoon', ? i.e. Quintadena)
- 'der Zinck' (Zink or Cornett, either a reed or Tierce-holding flue Mixture)
- 'Schwiegeln' (Flageolet, ? of 2′)
- 'Registar... gleich eim Positiff ein Regall oder ein Superregal' (another stop ... 'like a Positive, Regal or Octave-regal', ? i.e. a Regal stop)

Rückpositiv
- 'die Principaln' (Principal, 'either of wood or of tin voiced like wood')
- 'Gemsslein' (small Gemshorn)
- 'Hindersetzlein' (small Mixture)
- 'guts rheins Zymmelein' ('good clean Zimbel', ? i.e. without Tierce)

Pedal
- 'Principaln ym Pedal' (Principal, ? transmitted from the *Hauptwerk*)
- 'Octaff'
- 'Hindersats' (Octave and Mixture, ? also transmitted)
- 'Trommetten oder Busaun' (Trompete or Posaune)

little chests such as *Brustwerke* merely increases cost and produces 'much sauce for little fish'. Reeds are not unreliable if properly made, and Schlick thought a competent organist could soon learn how to make the necessary minor adjustments to them. Stop-levers (preferably not push-pull) should be conveniently placed, not too long or too heavy to work from the keyboards.

Thus Schlick knew an organ of Principals, Mixtures, flutes and reeds; two manuals and pedal; probably a manual coupler; different open metal pipe scalings (circumference to length 1:5, 1:6 or 1:7); and conical metal pipes, but not, evidently, stopped pipes or wooden ones. He recommended a compass of *F–a″* and a pitch level about a tone lower than that of today (his *a′* = *c*374–92, depending on the diameter of the pipe). The pipe metal was pure (or mostly pure) tin and the Principal was doubled (two open metal ranks of different scale). While recommending an irregular tuning with an A♭ that could also serve (if ornamented) as G♯ in a cadence on A, Schlick recognized that some preferred a regular meantone temperament (with major 3rds slightly larger than pure), but saw little use for split sharps as a means of dealing with problems of temperament.

Some of Schlick's general attitudes to organs are informative. He felt that eight or nine stops in the Great were all that were needed; they should be clearly different in tone; and the second manual was to be regarded as a kind of small positive, in no sense a match for the Great. The organ was used in connection with the liturgy, he observed; the priest at the altar was given notes for most mass movements from the Gloria onwards. And since the organ had a particular part to play in such music as sequences, it was placed near the choir for convenience. The pedal may have been transmitted from the Great; certainly it should have stops of the same pitch as the main manual. The pedal must have separable stops like the Great; it should not be made up only of suboctave stops, as it then inverts the harmony. (This must presumably be a double reference to organs with extra large pedal pipes always sounded by the pedal keyboard, and to the practice, then probably rather new, of using the pedals to play inner tenor or cantus firmus lines.) Reed stops can be made well (some are mentioned that sounded new though nine years old). As to Mixtures, neither those consisting of 5ths and octaves nor those of 3rds and 5ths should contain low-pitched ranks. The full chorus should be able to play chords (that is, the 5th ranks in Mixtures should not produce too dissonant a sound when the 5th C–G or the 3rd C–E is played); at the same time, the precise number of ranks in a Mixture depends on the size of the church. Manual keys should not be too long or short, too wide or narrow, nor spaced too far or too near; the given measurements suggest relatively stubby keys with an octave span about the same as on modern instruments.

Some of Schlick's own music in *Tabulaturen etlicher Lobgesang* (1512) is contrapuntal in a way that closely anticipates later organ chorales which use the theme imitatively in three or four parts; in such pieces the pedal took the tune when it appeared in the bass. Schlick also knew pedal playing in two, three and even four parts, as well as pedal runs; for none of these functions would the old Trompes have been useful. The inner-voice cantus firmus technique, however, apparently requiring pedals for music from the Buxheim Organbook onwards, should not necessarily be taken at face value: such organ 'scores' must often have been open to various interpretations or playing methods, and what appear to be third-staff pedal parts in the Buxheim Organbook may (at least in some instances) simply be an easy way of avoiding part-crossing problems.

The largest chapters of the *Spiegel* are concerned with tuning (*see* TEMPERAMENTS, §3), the making of chests, and the bellows. Schlick's advice is always very practical; for example, the wind must be generous (presumably for homophonic textures on full organ), the organ constantly played (even during Advent and Lent), and only the best and most experienced builders trusted. The little book thus surveys the whole field of organ activity – building, playing, composing – and even the long chapters on chests and tuning are full of good, pithy advice. For its size and single purpose, the *Spiegel* has never been bettered.

4. THE NEW POTENTIAL OF THE 16TH CENTURY. Soon after 1500 organs could produce a greater variety of colour and tonal effects than ever before because they had separate stops or several keyboards, or both. Many new stops (above all flutes and reeds) were invented, and one or two extant documents of the period indicate how they were used. About 1510 in both the Rhineland (Worms) and southern France (Bordeaux), such documents contained advice (perhaps from the builder) about registration. *Plena* were mentioned, of course, but more interesting in view of Baroque registration were the two- or three-stop combinations; the list in Table 5 can be inferred from the *instruction pour le jeu d'orgue* appended to the contract for an organ built by Loys Gaudet for St

TABLE 5

16+8	16+8+4+1⅓
16+1⅓	8+4+2⅔ +2 +1⅓ +1
16+8+4	etc

Michel, Bordeaux. This organ was a southern-style instrument of nine separate single-rank stops, and within a small spectrum such ranks would yield many combinations. More instructive still are the German registrations (St Andreas, Worms; Table 6), since they concern an organ with pedal and multi-rank stops. Schlick too wanted stops drawn in different combinations, and registrations changed.

Particularly important in the documents concerning such new organs as that of Daniel Van der Distelen in Antwerp Cathedral (1505) was the implied distribution of sounds into distinct groups: principals, flutes, reeds and mixtures. From then on, such families were to be paramount. Single-rank mutations, whether scaled as principals or flutes, belonged more to southern organs at that period; but at Antwerp there were at least four reeds, all for specific colour imitations (Cornett, Bagpipe-Regal, Trumpet and Krummhorn/Dulzian). Such imitations became so important during the 16th century that both reed pipes and combinations of flue stops were used to give the desired effects; often it is not clear from a document which of the two a certain Zink, Cornet, Nachthorn or Rauschpipe was. Trumpets and Krummhorns, however, were always imitated by reed stops. It is also unclear from the documents of about 1510 whether the many kinds of flute pipes mentioned were open or stopped. In most cases it could well be that they were open and that stopped pipes were reserved for special colour stops like the Quintadena or perhaps for the second ranks backing the Open Diapasons of the case front. In 1518 Sager promised in his contract with St Mary Magdalene, Basle, that 'the stopped pipes shall be bold and sweet [*tapferer und liblich*] so that they are not too puerile [*nit zu kindlich*] but audible throughout the church'.

During the period from 1500 to 1550 Flemish, north German, north French and Spanish organs had much in common. The Netherlanders in particular developed a mature organ of archaic features, described in Vente's *Die Brabanter Orgel* (D(xxi)1958). In 1510, however, the organ of the Upper Rhineland may have been the most advanced of Europe, having (in addition to principal and mixture stops) wide flutes, narrow stopped pipes, several reeds and smaller *Brustwerk* chests as at Bozen (1495). As so often, very little real connection between this type of organ and the music supposedly written for it can be demonstrated; it is even difficult to understand the relation between Schlick's own music and the organ he prescribed. The connections seen by many modern writers between a south German organ of about 1520 and the group of south German tablature sources of the same period are only speculative. In fact there was in about 1510 so much international activity between builders that national types are difficult to distinguish. Flemish builders in particular could be found working throughout Europe during the 16th century.

The early 16th-century organ was full of colour: manual reeds, regals in the Positive departments (*Rückpositiv*, *Brustwerk*), pedal reeds; Gedackt, Quintadena, Rohrflöte stops (Alkmaar, Laurenskerk, small organ, 1511); Gemshorn and Hohlflöte; Sifflöte, Schwegel 1⅓' and other flute mutations. The last are very significant, often uncertain in documents but usually associated with some special colour effect and even special etymology ('Nasard', 'Larigot'). Tremulants, toy stops (drums, bird calls, bells) and moving statuary were known by the end of the 15th century. The structural developments were very important, particularly the Netherlands builders' division of the Great organ into two departments (each often with its own manual): Principal chorus and trumpets on the HAUPTWERK, or main manual, and flutes, Gedackts and mutations on the OBERWERK, or upper chest. This separation ensured good wind supply, greater freedom of registration, safer chest construction and better acoustical dispersal from shallower cases. The *Oberwerk* was to influence, even create, the special potential in the next century of the north German WERKPRINZIP organ, in which each 'department', or *Werk* (i.e. a keyboard with its chest or chests), had a separate structure. Some examples typifying the schemes of about 1550 at their best, organs to which the previous developments were leading, are given in Tables 7, 8, 9 and 10.

In the Iberian Peninsula, organs were generally built by Italians (e.g. Évora Cathedral, 1562) or Netherlanders (El Escorial, *c*1580); there were scarcely distinct Iberian characteristics. Yet Évora had more Mixtures than an Italian organ, and El Escorial had its secondary manual in the form of an internal Positive (*Cadireta interior*) rather than a Dutch-Flemish *Rückpositiv*. In England organs appear to have remained single-manual instruments until the late 16th or early 17th century, although some of these, particularly in large monastic foundations, may have reached a fairly good size before the Reformation. While early 17th-century English organs had the southern characteristic of single, individually available ranks at unison and quint pitches, early 16th-century organs were more Flemish in style and appear to have had the partly divided *Blockwerk* scheme of north-west continental organs of about 1500. Wooden pipes, and even organs with wooden pipes only, were known in the 16th century, but there is no evidence of reed pipes having been incorporated into large church organs until the late 17th century, although small regals containing both reed (short-length) and flue pipes were much in evidence and are described in some detail in an inventory of Henry VIII's household furnishings (see §8 below). Early in the 16th century the English organ acquired a slightly larger key compass than the organs of northern Europe, a characteristic maintained into the 18th century. The double organ with Great and Chair (*Rückpositiv*) division is documented from the beginning of the 17th century, and inspired the writing of a type of voluntary in which solo passages were played by the left hand on the Great against an accompaniment on the Chair, both hands usually going to the Great in the final section – the so-called 'double voluntary'.

As the 16th-century Italian organs in Innsbruck and Brescia still exist, various subjective descriptions of their tone have been made. At Brescia (see Table 9) the average to narrow scalings (apparently untransposed) and the low pressure give a mild tone, round, rich and singing. Low pressure may also explain the absence of reed stops in such organs, or vice versa. The downward compass of Italian organs varied with the size of the church: the larger the church, the lower the compass. The top note was almost always *a''*, the bottom *c*, *G* or *F* (positives), *C*, *G'*, *F'* or even *C'* (full-size organs). The 15th-century organ at S Petronio, Bologna, went to *F'* or *G'* at 16' pitch (i.e. into the 32' octave). When pedal-boards were added later to such organs, they were thought of as mechanical conveniences for pulling down the bass keys; pedal parts (beyond pedal points and cadential chord roots) do not appear in Italian or Iberian music until the 19th century. As for the pipework, only open metal pipes were included. The ranks of the separated high stops break back no higher than the pipe sounding *c*♯''''; that is the top treble of the compass has an accumulation of ranks usually no higher than Principale 2', resulting in a kind of circumscribed, if fully divided, *Blockwerk*. The lower ranks are sometimes

divided between *b* and *c*′. Musically, such organs had a distinct function and character. Costanzo Antegnati's rules for registration (1608) show timbre, musical style and liturgical function to have been intimately connected; for example, the *ripieno* or *tutti* was drawn for sustained music of the *durezze e ligature* style, which was itself applied to such pieces as toccatas at the end of the 'Deo gratias'. Flute stops of all pitches were *da concerto* (i.e. 'for solo use'), not for accompanying motets or filling out the ripieno. The undulating Fiffaro (or Voce umana), a principal-toned rank, was drawn with the Principale alone and played slow music 'as smoothly and legato as possible', often with melodic snatches in the right hand (as in Frescobaldi's toccatas), and is frequently recommended for playing in the Elevation. Some useful combinations were those shown in Table 11. At the same time, as Diruta showed, some keys (i.e. ecclesiastical tones) were associated with particular moods and hence particular registrations. He recommended 16′ with Flauto 8′ for the mournfulness of E minor (Phrygian); but for D minor (Dorian, full and grave) he added as alternative suggestions 16.8 and 16.16. For F major (Lydian, moderately gay) he recommended 8.4 with Flauto 4; but for G major (Mixolydian, mild and lively), 8.4.2. Equally important is that three is the largest number of stops drawn in many such lists of registrations, apart from the various big *ripieni* used only once or twice in a service. It is never certain how far or wide such rules apply, but much Italian music of about 1620 can be seen in terms of the older Antegnati organ, more modest though the organs of Rome, Naples and elsewhere seem to have been. The greatest developments in Italian organ building between 1475 and 1575 were rather in the design of the cases (Gothic to Renaissance; fig.32) than in the technical or musical sphere, where there is an unusual conformity.

The 1551–61 Ebert organ at Innsbruck (see Table 8 and fig.33) is very strong in tone, neither manual proving useful for accompanying a choir. The cases are shallow (*Rückpositiv* less than 50 cm), the chests spacious, the organs contained in resonant wooden boxes. Since all the Chair organ (*Rückpositiv*) stops have close equivalents in the Great organ (*Hauptwerk*), yet at only 4′ pitch (as so often during the 16th century and the late 15th), the two manuals can be regarded partly as extensions of each other in different directions. Indeed, the Innsbruck organ puts in a new light the perennial question of the purpose of second manuals (a question rarely admitting of any obvious answer, despite common assumptions). The stopped pipes at Innsbruck are very strong in tone, with a big mouth and a tone-colour ranging from wide, vague flute sound in the bass to strong, breathy treble colour. The two Hörnli stops are very keen, repeating Terzzimbeln. Throughout the organ there is a distinct change of tone-quality from bass to treble, enabling the *Hauptwerk* bass keys to produce a different quality of sound from right-hand solo lines in the treble.

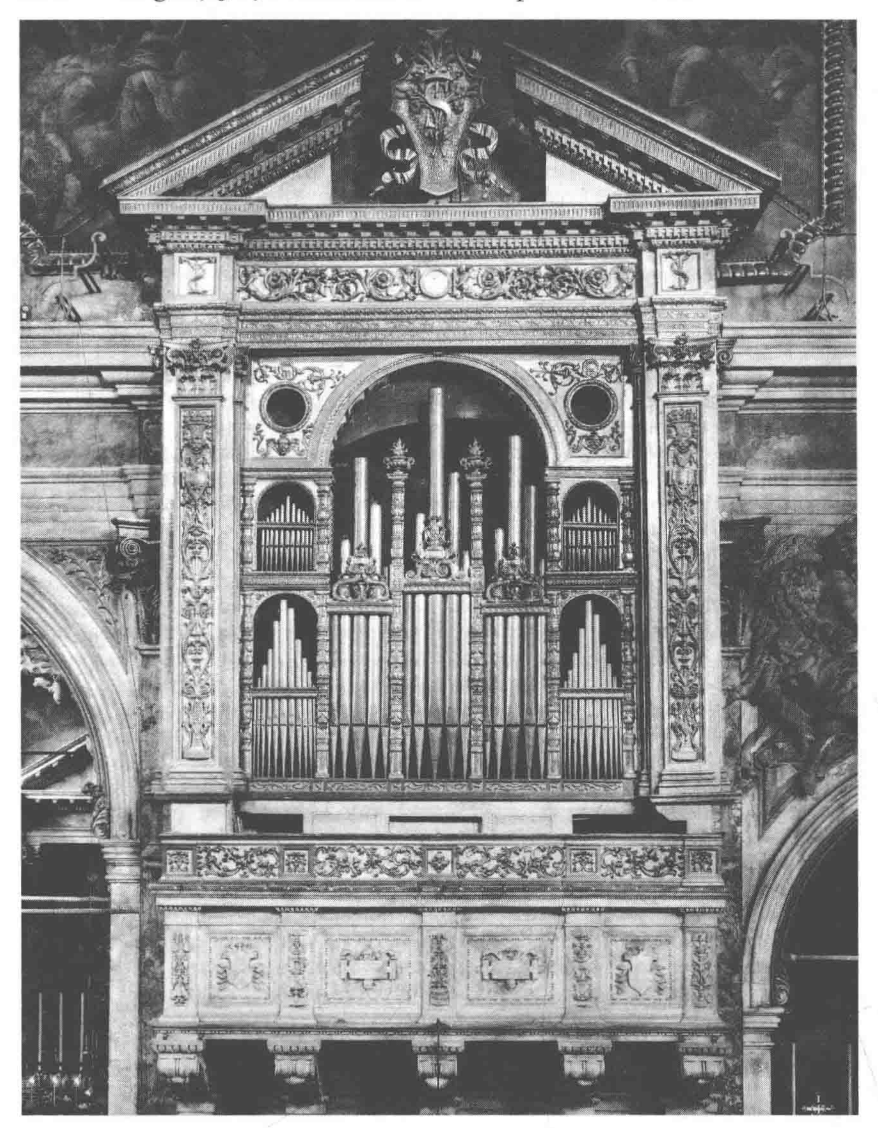

TABLE 11

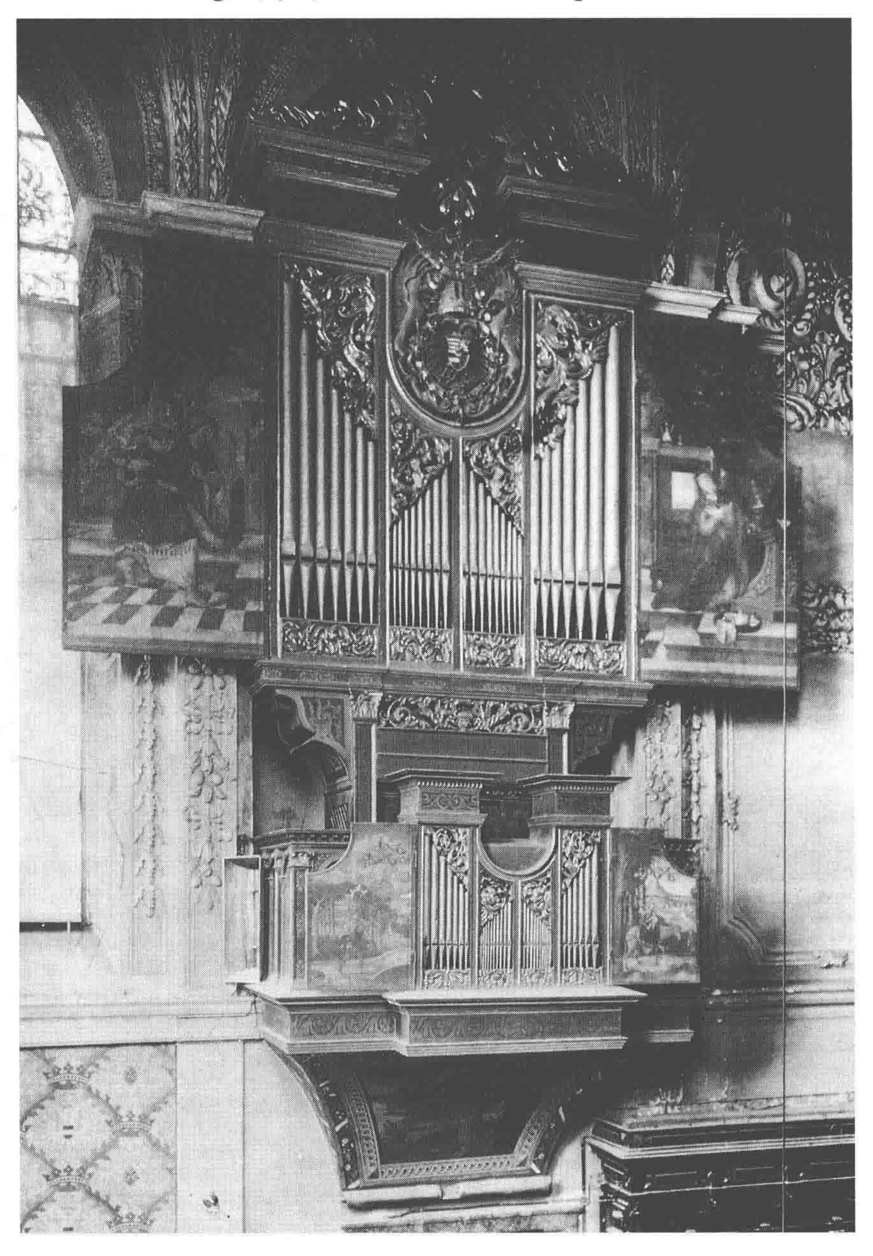
Ottava 8′ + Flauto 8′, good for quick passages and canzonas
Principles + Flauto in duodecima, good for quick passages and canzonas
Principale + Flauto in quintadecima, good for quick passages
Pedal pipes, good for occasional long note in a toccata
Ripieno: 16.8.4.2$\frac{2}{3}$.2.1$\frac{1}{3}$.1.$\frac{2}{3}$
Mezzo ripieno: 8.4.1.$\frac{2}{3}$ with Flauto in ottava
or 8.4 with Flauto in ottava
or 8.4 with Flauto in duodcima
Use half-stops 'per far dialoghi'

The organ of the Oude Kerk, Amsterdam (see Table 7) was that known to Sweelinck and shows the 'Brabant organ' at its most characteristic: big Principal chorus, large flute stops on an *Oberwerk* chest, smaller stops but yet greater variety in the *Rückpositiv*, and the pedals playing the *Hauptwerk* chorus for *plenum* registrations and also having a pair of high-pitched, strong-toned solo stops for (presumably) cantus firmus music. The sheer variety in the manuals would alone have encouraged variations on psalm tunes and folk melodies over the next century or so, even had there been no tradition for weekday organ recitals occasioned by the prohibition of the use of the organ in the Reformed liturgy until after the middle of the 17th century. From surviving examples of Niehoff pipework, it seems that the inner parts were of thick, hammered lead of good quality; the principals were narrow in the bass, wider in the treble; and the whole had a mild-voiced, singing quality quite different from the organ of the later Baroque period. Flutes were wide to very wide; reeds penetrating, particularly in the bass. The spring-chests were considered an advance on the slider-chests already known for smaller organs (Alkmaar small organ, extant slider-chest of 1511) or for the Chair organs of larger instruments; and in some areas (north Italy, Westphalia) spring-chests of different types remained popular for well-spaced, large-scaled organs after they had fallen out of fashion in the north. The Amsterdam organ was evidently of a very high class, and its concept and musical repertory were known in Brabant, the Netherlands, Cologne, Würzburg, Lüneburg and much further east. Some examples had big Pedal divisions, resulting during the period 1575–1600 in an organ type known from Groningen to Danzig, Frederiksborg to Prague, and passed on by a group of composers directly or indirectly under Sweelinck's influence.

The musical position of the 1580 Barbier organ at Gisors (see Table 10) is less certain, as indeed is that of all French organs before about 1660. The French organ of 1520–75 often had a wide array of colour, whether of the Bordeaux-Italian type in the south, or the southern Flemish variety of reeds and compound stops in the north. Reeds of 16′, 8′ and 4′ could be expected in a larger organ of about 1575; so could one or more Quint mutations; 8′, 4′ and possibly 16′ ranks of stopped (often wooden) pipes; a few 'obsolescent' stops like the 1′ Principal; and even a mounted Cornet, often called 'Flemish horn' (*see* ORGAN STOP, under 'Cornet'). In many respects the Gisors organ was Flemish: the *Positiv* construction (in French instruments the Chair organ had become temporarily uncommon), the spring-chests, the *CD–c‴* compass, the Quint flutes of 1$\frac{1}{3}$′, the 8′ pedal stops, and the *grand ravalement* for the pedal reed. In sound, no doubt the instrument was nearer to the Netherlands organs of Niehoff than to the late classical French organs of F.-H. Clicquot.

5. STRUCTURAL DEVELOPMENTS *c*1600. From the many enormous and apparently amorphous organ specifications given by Praetorius it could be reasonably thought that many central German builders of the late 16th century did not have clear control of the organs that their technology enabled them to build. The number of stops and stop types listed by Praetorius is evidence of his attempt to give order to a somewhat embarrassing luxury



32. SS Annunziata, Florence, showing the southern organ of a pair built in 1523 and facing each other across the east end of the nave

of choice. The number of 4′ solo Flutes alone, for instance – narrow, wide, open, stopped, chimney, spindle, narrow-stopped, narrow-conical and overblowing–narrow-stopped – contrasts strongly with the 17th-and 18th-century systematized French organ of average size, where there was probably only one plain Bourdon 8′ or Flûte 4′, and that with a very specific function. Some of the biggest organs, such as those in Prague and Danzig, are scarcely credible: the Týn Church in Prague appears to have had a four-manual, 70-stop organ built between 1556 and 1588, but it is possible that it was a conglomerate instrument, finished in part, but perhaps never all playable or ready at once.

More important was the potential opened up by new mechanical skill in disposing multiple chests – giving the Pedal, for example, a pair of back or side chests for the large pipes, using front chests for middle Principals and a *Brustwerk* chest or two for smaller-scaled solo stops. Each pedal key then connected with two or even three pallets. The first such 'multiple action' may have been built earlier in the century in the central Netherlands (Antwerp Cathedral, 1505; St Zwysen, Diest, 1523), but the evidence is inconclusive. By the end of the century extravagant court chapel organs were built with some of the richest mechanical layouts ever known before pneumatic action, allowing an immense array of stop combinations. If the simple organ of 1563 for the Dresden court chapel allowed 77 manual combinations with its 13 stops and Tremulant, as stated in a contemporary document, then hundreds were no doubt possible on the famous Groningen court chapel organ of 1592–6 (Table 12). Whether there was enough fish for all this sauce might have been doubted by Schlick.

Clearly the Groningen organ offered many colourful effects, particularly those of two or three stops only; indeed, the number of stops normally drawn at once by organists of that time cannot be assumed from modern practices. With the exception of three Principal choruses of four or five stops, the registrations at Dresden (referred to above) were all of three stops or less. Quite apart from what this fact might imply about the state of contemporary wind-raising techniques, it suggests that organs of the period were geared towards subtle colour and musical variety. As to the 'multiple chests' themselves, a very

33. Organ by G. Ebert (1551–61) in the Hofkirche, Innsbruck; the Annunciation scene on the shutters was typical of 16th-century Venetian organs, while the flat Rückpositiv, designed as a small version of the main case, was unfamiliar outside southern Germany

plausible attempt to describe their complex action, double pallets, transmission and extension system has been made by Bunjes (D(xv)1966). The most useful arrangement was the most traditional and long-lived, namely the multiple pedal division in which the biggest bass pipes would take one or two chests, and the cantus firmus and other high stops another chest. Wind could be prevented by a *Sperrventil* from entering any chest not immediately needed; and a low pressure could be the better sustained if no chest was above a certain size.

A circumspect reading of Praetorius reveals three main types of complex layout, two of them multiple action: (i) the double action enabling two or more chests to be played by one keyboard (e.g. *Brustwerk* and *Oberwerk* from *Oberwerk* keys only); (ii) the transmission chest (with two pallets), enabling one or more ranks of pipes to be played by two keyboards (usually the bigger stops of the *Oberwerk* played by pedal keys); (iii) octave and even quint transmission or 'extension', that is, a chest construction enabling a rank of pipes to be played at unison, quint or octave pitches. The third was very rare, but important in view of later developments. Since couplers were also much to the fore in organs using complex action, and since the *Sperrventil* increased the registration possibilities (by making drawn stops inoperative until required), it can be seen that an important musical aim was maximum variety for a given number of ranks. But such aids had the potentially bad effect of overemphasizing the main *Oberwerk* chest to the detriment of true secondary manuals, weakening the independence of the pedal, and encouraging the cultivation of intricate workmanship as an end in itself. But the Chair organ remained an independent department in the major organs, and as such helped to provide the right conditions for most idiomatic

organ music of 17th-century Germany, as it also did in France, the Netherlands, Scandinavia and England.

6. THE WERKPRINZIP ORGAN. The Chair organ was indeed the manual that supplied the true balanced chorus to the Great; but in areas or periods in which second manuals were required for simple echo effects or soft background colours (Spain and Italy during the whole period, France during the 16th century, England after 1700) or in smaller churches where expense had to be avoided, the Chair organ was dispensed with and smaller chests were incorporated in the main case.

The visual characteristics of the WERKPRINZIP organ (the term is a modern one, coined by the 20th-century reformers) – the single main case, the Chair organ, the separate pedal towers – were all known by the 15th century. But by the time of Praetorius, owing to the range of available organ colour and the widespread mechanical skill in making good actions, builders were able to develop a type of instrument using such features put to new, unified purpose. Scheidt's remarks in his *Tabulatura nova* (1624) imply a sophisticated and codified practice for organs and their music, and show the instrument to have developed well along the lines laid down by Schlick and beyond recognition of those laid down by Arnaut. Indeed, it is a mistake to relate the *Werkprinzip* Chair organ and (even more so) its pedal towers to the organ of Arnaut's period. It is often very uncertain whether in about 1450 the Chair organ of a large instrument had the same pitch as the Great organ or its keys aligned with it; nor was two-manual playing necessarily known outside Schlick's area and period. Similarly, although side towers or *trompes* held bass pipes, they were not necessarily played by pedal keys; in any case, a vital function of *Werkprinzip* pedal towers is that they hold cantus firmus solo stops near the Protestant congregation in or below the gallery. No doubt the larger instruments of about 1550 might have had pedal towers combining both characteristics; but the *Werkprinzip* organ flourished many hundreds of kilometres north-east of the areas knowing the old *trompes*, and did not become fully developed until after the Reformation.

One of the attractions of the *Werkprinzip* was that an organ could be altered and its potential enlarged simply by adding a new department to the old. While the Totentanz organ of the Marienkirche, Lübeck (destroyed in 1942), is much less understood than modern references to it suggest, it is certain that its four departments expressed the ideals of four quite different periods: the *Hauptwerk*, the late 15th century; the *Rückpositiv*, the mid-16th century; the *Brustwerk*, the early 17th; and the completed Pedal organ, the early 18th. Many famous organs of this type in northern Europe (e.g. Jakobikirche, Lübeck; Johanniskirche, Lüneburg) are in fact composite instruments (quite apart from modern rebuilds), accumulations of *Werke* constantly altered in compass, specification, tuning and no doubt voicing by builder after builder. The smaller Jakobikirche organ, restored in the 1980s to the form given it in 1636 by Stellwagen, still contains part of its late 15th-century Principal chorus, the pipes made of nearly pure lead. The big organs of the Niehoffs, the Scherers, and the Compenius and Fritzsche families were like living organisms; except for the large chamber organ in the chapel of Frederiksborg Castle, Denmark, none remains in anything like its original state.

Organ historians are often tempted to trace the organ's evolution in terms of the best-known builders. Frequently, however, contributions are attributed to a builder on the basis of mere conjecture or even fable. Probably not a single item in the list of innovations commonly attributed to Gottfried Fritzsche, for instance, is specifically his: inclusion of a fourth manual; more systematic use of 32′ and 16′ reeds to written C; introduction to north Germany of rare stops, both flue (Viol, Schwiegel, imitative flutes) and reed (Sordun, Ranket); contrast between narrow 'male' and wide 'female' stops (e.g. Nasat $2\frac{2}{3}'$ and Quinte $2\frac{2}{3}'$ on the same manual); reduction of the big Brabant Scharf Mixture to a high repeating two-rank Zimbel; greater use of tin in the pipe metal, and also of wooden pipes (reeds, flues, stopped, open); and systematic adherence to C compass, sometimes with split keys (*d*♯/*e*♭ etc.). But they certainly belong to his period. Such a list, taken with the provincialisms running through Praetorius's *Syntagma musicum*, ii (2/1619), does lead to a distinct kind of organ. The chief musical characteristics of the *Werkprinzip* thus emerging in a purer form in the north were: the contrast between a full, round *Hauptwerk* and a thin, piercing, more variable *Rückpositiv*; the versatile pedal; and the clarity of the whole in average parish churches with little reverberation. In most cases it was the

34. Organ by Arp Schnitger, 1695, originally in the Johanniskirche, Hamburg, now in the west gallery of the village church at Cappel

Rückpositiv that was understood to be the 'solo manual', and as such it performed an important function in the chorale-based literature of the 17th century. The idiom was clearly defined for organists, who seem to have been in little need of registration hints either from composers or from builders. (Balanced contrast could easily be achieved between two manuals if the same number of stops was drawn in each.) Explicit and firm registration rules have been formulated only in areas and at periods in which organs were more uniform (e.g. in northern Italy *c*1600, France *c*1700 and England *c*1750).

The Hamburg *Werkprinzip* organ reached maturity and indeed satiation in the work of Arp Schnitger, famous in his day far and wide, the possessor of many privileges, and, with Gottfried Silbermann (whose organs were quite different in many ways), the inspiration for the German Organ Reform (*Orgelbewegung*) of the 1920s. Despite work in progress, surprisingly little is certain about Schnitger – how responsible he was for his individual instruments (his workshop was large and active), what his scaling policy was (scales vary hugely, depending on the church, the pitch, the value of the old pipework he re-used, etc.), what his pitch and temperament were, why he usually changed small multifold bellows to large single-fold bellows in his rebuilds, why he dropped the *Rückpositiv* in his late work around Berlin, who designed his cases (fig.34). Research has established that his wind pressures varied between about 94 mm or higher (the large organs in Hamburg) and about 67 mm, an average being about 85 mm (Nikolaikirche, Flensburg).Table 13 gives the stop list of his first four-manual organ, in the Nikolaikirche, Hamburg (destroyed in 1842). Such very large organs give a kind of highest common factor of instruments known to such composers as Buxtehude, Lübeck and Bruhns and on which toccatas and chorales of the older composers (Scheidemann, Weckmann, Tunder and others) were still played. In some areas of the Netherlands, north Germany and Scandinavia, such an organ remained the model until 1850 or so, and the *Werkprinzip* can be recognized behind later organs very different in sound and appearance from the Hamburg Nikolaikirche.

7. THE FRENCH CLASSICAL ORGAN. In northern Italy the 'classical Brescian organ' of the late 16th century remained a norm to which the occasional 17th-century two-manual organ was an exception (and probably built by a foreign builder); it was only in the mid-17th century that the French organ achieved its classical form, intimately bound up with music of a distinct and well-characterized idiom. The very number of *livres d'orgue* published following the publication of the *Caeremoniale parisiense* (1662; *see* ORGAN MASS) suggests a remarkably unified 'organ school'. Every stop in a French organ of about 1700 came to have an appointed purpose, and the *livres d'orgue* from Nivers (1665) to Marchand (*c*1715) and beyond, several of which contain registration tables, give the impression that late 17th-century Paris had shaken off outside influences past and present.

But Flemish influence had originally been paramount in northern France as Italian and Spanish had been in parts of southern France. Titelouze's *plenum* was much the same as that of a Dutch composer. Even the Cornet was Netherlandish, from the time of the organ in Antwerp (1565) onwards. Yet while many details in Mersenne's *Harmonie universelle* (1636–7) may point to northern influences like Praetorius, important moves towards the organ of the *livres d'orgue* were made at this period, above all in Paris. Narrow- and wide-scaled Tierces soon became common (narrow at St Nicolas-des-Champs, 1618; wide at St Jacques-de-la-Boucherie, 1631) and with them a general change towards mutation colour (e.g. more $1\frac{3}{5}'$ ranks, fewer 1′). Mersenne knew Tierces as ranks used both in the *plein jeu* and for solo combinations. More important still were the new short-compass keyboards of solo or quasi-solo character: the 25-note Cornet manual (i.e. a *Récit*) at St Séverin, Paris (1610), set a new fashion, though intended at first only as a little keyboard giving the raised Cornet chest a second row of keys. Were the little extra chest to be placed below the *Grand orgue* it would be called *Echo* and probably have a shorter keyboard and more ranks. By 1660 a large organ could be expected to have four manuals (including two treble halves): two supplying classical Great–Chair organ contrast (*Grand orgue* and *Positiv*) and two right-hand solo manuals (*Echo* and *Récit*) for music influenced by the monodic *récit dramatique* of the *ballet de cour*.

The organ played by Nicolas Lebègue (Table 14), one of the organists to Louis XIV, shows the French scheme of the period at its best. Rarely can an organ have been so closely related to the music of its period as such an instrument to the works of Lebègue, Raison, Grigny, Couperin and others. Standardization was one of the chief aims. To obtain the PLEIN JEU for those movements in the Mass that required it, for example, the organist drew the Principals 16′, 8′, 4′, 2′, then added the Fourniture, whose composition was probably something like:

C–e	15.19.22.26.29
f–e′	8.12.15.19.22
f′–c‴	1.5.8.12.15

and then finally the Cymbale:

C–B	29.33.36
c–e	26.29.33
f–b	22.26.29
c′–e′	19.22.26
f′–b′	15.19.22
c″–e″	12.15.19
f″–c‴	8.12.15

which, if it was a large four-rank Cymbale, included the 26th as well. Such schemes were recorded by Bédos de Celles (B1766–78) at the end of the great period but can be taken as typical; thus, for instance, his specification of 1766 (for the case design, see fig.35) is almost indistinguishable from that of the 1674 organ at Le Petit Andely. Important points about the French chorus (which also, through his brother Johann Andreas in Alsace, influenced Gottfried Silbermann in Saxony) are that the Cymbale broke back more often than the Fourniture but generally duplicated the Fourniture in the treble; no rank is higher than 2′ at *c‴* (i.e. 28 mm long); and doubled ranks did not occur in either Mixture. The *plein jeu* was rarely brilliant, never shrill; it was rather a further 'colour' of the organ.

Pitch, at least from about 1680, was about a semitone below *a′* = 440. Pipe metal was hammered, including the lead pipes for flute stops. The keyboards were always pivoted at the end, and the mechanism suspended from the chests above, trackers passing straight from the *Grand orgue* keyboard to the pallet box ranged vertically above

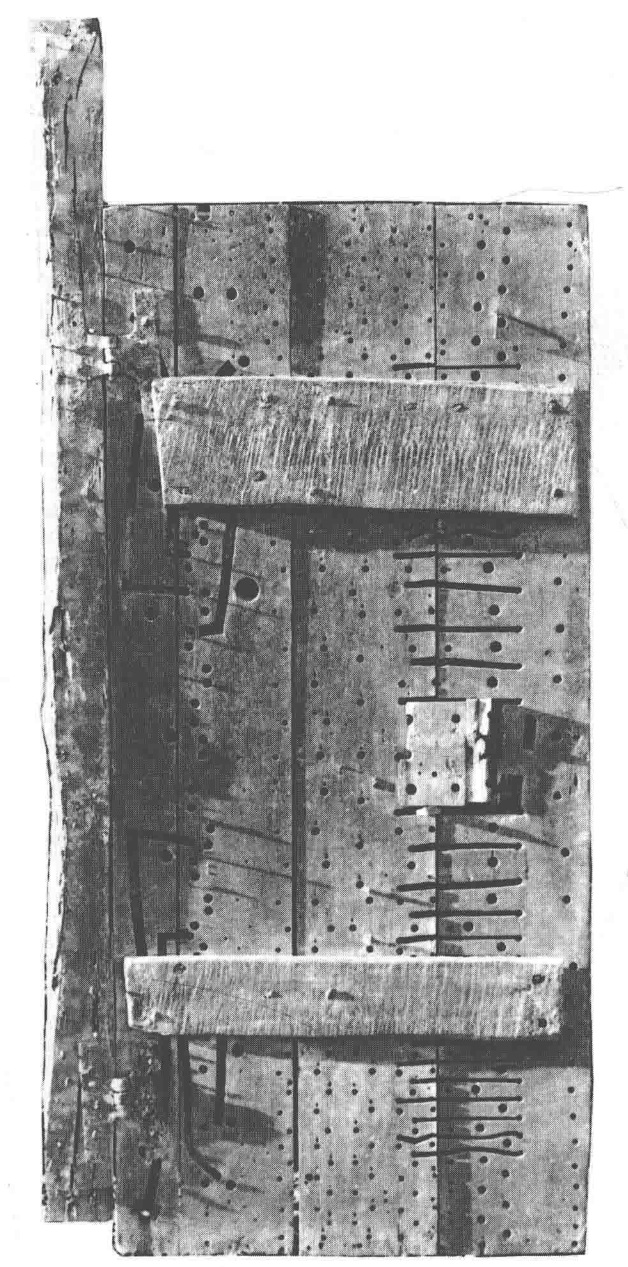
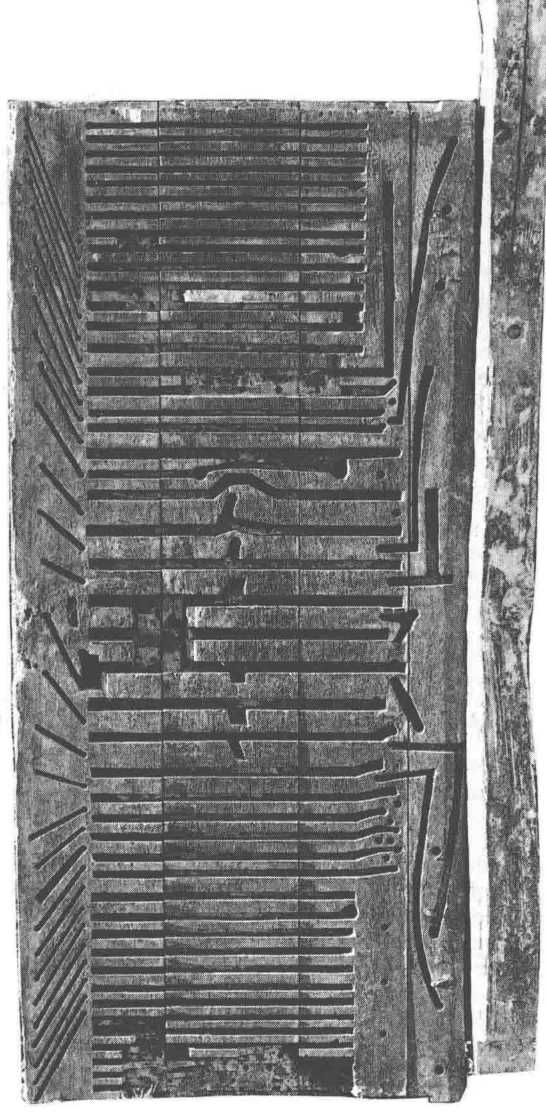
the keys (fig.36). The *Positif* stickers connect with a lever which raises the pallet placed above the channel-end. Such systems were simple and logical, providing the player with a very sensitive action facilitating, among other things, the playing of ornaments.

To obtain the GRAND JEU, the organist drew a varying combination of reeds, Cornet, Principals 8′ and 4′ and Tierces, but no mixtures. The reeds supplied volume and brilliance; the Cornet boosted the thin reed trebles; the Tierces encouraged the overtone level that gave prominence; and the Principal 4′ strengthened the basic tone. Fugues were often played on such registrations, and other fugal colours, such as Tierce combinations with Tremulant, give an impression quite different from that of Italian or German fugues of the period 1650–1750. On larger organs, a pair of Trompettes on the *Grand orgue* after about 1750 gave a timbre peculiar to the bass depth and brilliance of French reeds. Late in the period a Trompette was also put on the *Positif*, and following the organ at Notre Dame, Paris (Thierry, 1730–33), *Bombarde* manuals were also very occasionally included – keyboards coupled to the *Grand orgue* and playing the large-scaled Bombarde 16′, perhaps with other large reeds; at Notre Dame the Bombarde division could also be played from the Pedal. The chief purpose of this was to give the ranks their own chest and wind supply, which was often experimentally high by the end of the classical period. Similarly, it was the treble 'boosting' supplied by the Cornet that led eventually to higher pressures and double-length harmonic resonators during the next century. The reed basses, however, remained the chief glory, encouraging composers to write special *basse de trompette* music from about 1650 onwards. *De grosse taille* ('of large scale') is a phrase often applied in 17th-century contracts to the Trompette.

Even in *plein jeu* registrations (in which the mixtures replaced the reeds for brilliance), the French organ was not overdrawn. Only a handful of stops was involved in any of the characteristic French registrations, and all the codified ingenuity was geared towards clearly marked colours. Thus the texture of a piece marked *Tierce en taille*, one of the most beautiful effects known to organists, would consist of the following elements: (i) left hand on *Positif*, Bourdon 8′ + Prestant 4′ + Doublette 2′ + Nasard + Tierce (perhaps + Larigot), playing a free, singing melody in the middle of the texture, gamba-like; (ii) right hand on *Grand orgue*, Bourdons 16′ + 8′ + 4′ (*jeux doux*), playing accompaniment above or around the melody; and (iii) pedal playing the bass line on a Flûte 8′ (or perhaps coupled to *Grand orgue* Bourdon 16′ in later examples). There was some variety in such registrations: Bédos de Celles, for instance, did not like 16′ manual stops in accompaniments. On the other hand, the Tierces were so characteristic of French organs that many combinations were possible: a right-hand Cornet line on the *Grand orgue*, for instance, could be accompanied in dialogue by a left hand *Jeu de tierce* registration on the *Positif*. From D'Anglebert (1689) onwards, Quatuors and Trios had been played using three different colours including pedal: indeed, the chief purpose of the pedal was 'pour pouvoir jouer les trios' (according to Joyeuse's contract at Auch in 1688) and to play 8′ and 16′ cantus firmus in pieces built on a plainchant. The biggest drain on wind supply and narrow channels must have been the slower, sustained

35. Design for a grand organ case: engraving from 'L'art du facteur d'orgues' (1766–78) by Bédos de Celles





36. Cross-section through an 18th-century French organ, showing among other details the multifold bellows, narrow wind-trunk, trackers and rollerboard, pallets for the Grand orgue side-chest for pedals, and Positif (behind the player): engraving from 'L'art du facteur d'orgues' (1766–78) by Bédos de Celles

music written for *concert de flûtes* and *fonds d'orgue* registrations, comprising all available Montres, Prestants, open Flûtes and Bourdons. Such sounds became fashionable around the middle of the 18th century; but whatever the combination, no organist in the provinces need have been in doubt about how the Parisian composers expected their pieces to sound.

The splendid French organ at the eve of the Revolution (1789) may well have been far superior to the music written for it, as were the Dutch organ of 1700 and the English organ of 1850; but it is the very decadence of the music that best draws out the extravagant contrasts, brilliant reeds, round flutes, echoes, big choruses and immense colour potential available on such extant late instruments as those at St Maximin-en-Var (J.-E. Isnard, 1773) and Poitiers Cathedral (F.-H. Clicquot, 1787–90). The French organ received a serious setback when the Revolution disrupted life in the cities. It was ripe for development at the very moment when Clicquot's sons became soldiers; but not until Cavaillé-Coll's organ for St Denis, completed in 1841, did Poitiers have a worthy successor.

8. THE ENGLISH ORGAN. Evidence for the late medieval organ in the British Isles is extremely sketchy, partly because of the protracted period of religious and political instability that lasted from the Dissolution of the Monasteries in 1536 until the Glorious Revolution of 1688, which wiped out a huge mass of material, and partly because the small instruments that were characteristic of this period warranted little in the way of extravagant description or fame. There is some evidence of connections with the European mainland. Despite Henry VIII's leanings towards Italian culture, those connections (at least in organ building) seem to exist in greatest number and importance with Flanders. Most significant were the appearances in England of Flemish organ builders such as Michiel Langhedul at Salisbury Cathedral in 1530 and Jasper Blancart in London (1566–82), both from families of craftsmen well known on the Continent.

The nature of the organs associated with the great age of Tudor church music remained completely obscure until the late 20th century, when a number of significant finds were made. There may have been isolated large organs in Britain, such as the one built by Laurence Playssher for Exeter Cathedral in 1513 (for which bills survive), but all the remaining evidence suggests that the standard instrument used to accompany the choral liturgy was small. This evidence consists of large numbers of inventory records made after the Dissolution, a couple of early contracts, and, since 1995, two fragmentary remains of early 16th-century instruments preserved by chance. The most important of these, the 'Wetheringsett fragment' (an entire organ soundboard of about 1520 preserved as a door in a farm building in Suffolk fig.37), indicates the type of instrument typical of the school (Table 15), its size and scope directly confirmed by contemporary contracts at All Hallows, Barking-by-the-Tower, London (Antony Duddyngton, 1519–20), and Holy Trinity, Coventry (John Howe and John Clynmowe, 1526). In large buildings instruments of this type seem usually to have been multiplied in number, but not in size. At Durham Cathedral before the Dissolution, according to one

37. Two views of the Wetheringsett fragment found used as a door at Meadow Farm, Wetheringsett: (left) upper face of the soundboard (back of the door, showing the added 17th-century hinges, door brace, loose square section for the door lock and (centre right) keyhole); (right) underside of the soundboard

account, there were five organs in various parts of the building, of which at least one had pipes of wood, each with its specific role in the liturgy and in the cycle of the church year. The largest instruments of this period may have been based on a full-compass Diapason of 10′ pitch, though the Principal 5′ was still regarded as the unison. The use of a long chromatic keyboard is characteristic of English instruments; the provision of the low accidentals, at a time when mean-tone tuning was probably universal, may be explained by the English love of ornamentation in keyboard music.

From around 1570 there is widespread evidence from all parts of the British Isles that, as a result of Puritan opposition, organs were removed and destroyed. With the revival of a High Church party in the early 17th century, led by William Laud, organs were returned to the cathedrals and collegiate churches, but not, it seems, to the parishes. The great majority of these new instruments, like the Worcester Cathedral organ of 1613 (Table 16), were built by members of the DALLAM family. Many were 'double organs', i.e. of two manuals, for which the genre of organ music that became known as 'double VOLUNTARY' was developed.

The Civil War of 1642 onwards brought an end to this activity, and organs across the land were again dismantled. The Catholic Dallam family sought refuge in Brittany,

where they continued to ply their trade, adapting completely to the local style. After the Restoration in 1660, organs were restored or newly built at first on exactly the same pattern as before the war. However, new foreign influences soon promoted the arrival of a new style, and a further wave of rebuilding and new commissions. The post-Restoration English organ was partly the result of rivalry between two organ-building factions. In the aftermath of the Fire of London in 1666 the city was opened to all craftsmen in order to speed the rebuilding. One who came was Bernard Smith (*c*1630–1708), an organ builder then resident in the Netherlands (although probably German in origin), later to become known in affectionate recognition as 'Father' Smith. He established himself and gained a royal connection in the early 1670s, much to the chagrin of his rivals, the remaining members of the Dallam family and their in-laws the Harrises. Smith and Renatus Harris (*c*1652–1724) made a public exhibition of their rivalry in 1683–8, both building new organs for the Temple Church in London, a contest that became known as the 'Battle of the Organs'. Smith's instrument (Table 17) was judged the better; Harris's organ was removed.

Smith went on to build the organ for Wren's new St Paul's Cathedral, completed in 1697. This also had three manuals, the Great organ descending to low *C′*, 16′ pitch. Pull-down pedals to the Great organ were added in 1720. The split keys, used by Smith at the Temple and at Durham Cathedral (1686), allowed for some remoter keys to be used without any compromise to the meantone tuning.

Despite Smith's success, Harris was ultimately just as busy. His own instruments (e.g. that for St Bride's, Fleet Street; Table 18) showed some influence from the Dallam-Harris clan's period of exile in France, and, given the continental background of these rival builders, the question might be asked as to why they did not introduce the conventional European C-compass or even independent Pedal organs. In fact Smith was working in the Netherlands at a time when the independent Pedal was only just becoming a feature of the largest new organs, and the depth of Harris's debt to France was surely tempered by the fact that he was only eight years old when the family returned to England in 1660.

In the end it was the Harris style that succeeded into the 18th century, through the work of Renatus's son John Harris and associated craftsmen such as Richard Bridge and John Byfield (i) and (ii). The standard three-manual instrument of the period, with its long-compass Great organ and (now) Choir organ (disposed as a Chair in some cathedral and collegiate instruments, but otherwise normally placed behind the Great), was enlivened by the conversion of the old short-compass Echo (where the pipes were entombed in a box of some kind) into an expressive Swell organ by fitting a movable front (operated by a pedal at the console) on to the box enclosing the pipes. The first example of this was introduced by the two Abraham Jordans, father and son, in their instrument at

St Magnus the Martyr, London Bridge, in 1712 (and may have been derived by them from earlier Iberian examples). Even the most fully developed large instruments followed this established pattern, simply supplying stops of familiar name and type in more extravagant numbers. In the instruments of Bridge (Table 19 and fig.38) and the Byfields a superficial resemblance to the French type remains, right down to the occasional use of wide principal scales for the mutation stops. However, it is clear that English national taste exercised itself vigorously in excluding any blatant sounds or gross pitches, the emphasis being rather on sweetness, delicacy, and the accuracy of the imitative registers (Trumpet, Hautboy, French Horn, Bassoon, Vox humana and Flute). The extempore players of the 18th century, performing voluntaries perhaps slightly more complex than those which survive in printed form for the large semi-amateur market, would have exploited these imitative effects to the full. The Swell divisions, originally fitted with sliding sash fronts, but by 1800 with 'Venetian' shutters after the pattern of the familiar window blind, enhanced the expressivity of these effects.

Registration followed conventional patterns. Solo stops (the reeds, Cornet and Flute) might be heard on their own. Otherwise the combinations referred to most frequently are 'Diapasons' (Open Diapason plus Stopped Diapason, used for slow introductory movements) and 'Full Organ' (all Great organ stops except the Cornet). The latter combination would be given an agreeable nasal twang by the Trumpets and Clarions, and by the provision of third-sounding Tierce ranks in the mixtures in addition to the usual unisons and Quints. During the 18th century organs such as this became universal in cathedrals, collegiate churches, and the parish churches of wealthier towns. In the cathedrals and colleges they accompanied the choir; in the parish churches they accompanied the congregation in singing metrical versions of the psalms and were used for extempore voluntaries before, during and after the service.

The market for new organs in the 18th century was vigorous and competitive, encouraging indigenous and immigrant craftsmen, including the Swiss-born John Snetzler (1710–85), who settled in London around 1740 and adapted completely to the local style. Considerable demand was also developing for small instruments for secular use. There had been a tradition of chamber organs in England since early times (*see* CHAMBER ORGAN and POSITIVE), and several examples of small organs, often with pipes entirely of wood, survive from the second half of the 17th century. There was a considerable revival of interest in the second half of the 18th century contemporary with (and perhaps because of) the great popularity of Handel, who seems regularly to have used small or

even portable organs when playing continuo and for the performance of organ concertos as interludes to larger works.

Later 18th-century builders, notably members of the England family and Samuel Green, continued to refine the basic recipe, adding only the Dulciana (a delicate string-toned stop first used in Britain by Snetzler) to the range of available voices, and never exceeding the size of instrument established by their immediate forebears. The only expansion in range came in the occasional provision of pull-down pedals to the Great organ, in larger and later examples operating a single rank of unison Pedal pipes also.

The national taste for subtlety and delicacy meant that English organs gradually became softer and prettier in sound as the century progressed. The importance of the art of voicing had been demonstrated by the rivalry of Smith and Harris. The Englands and Samuel Green became obsessed with tonal beauty. When Green built a new organ for Salisbury Cathedral in 1792 (Table 20), the building was closed to visitors for two weeks so that he could attend to the tuning and voicing in near silence. Green also provided an organ for the Handel Commemoration festival of 1784, an enormous event held at the west end of Westminster Abbey. Hoping to address such new demands, Green's successors attempted to build much larger organs in the years immediately following 1800, but still adhered to the insular recipe of the English classical organ type, until at last abandoning it in the 1840s in favour of the 'German system' of uniform C-compass keyboards and independent pedal organ.

9. The Baroque organ in the Iberian Peninsula and Latin America. The organ of the Iberian peninsula has many special characteristics. Yet Baroque organs of Spain and Portugal differ in detail from area to area, and while the visual parts of such instruments were indigenous and individual, their musical characteristics are founded in common European traditions. In 1500 Spanish organs stood at much the same point as those of northern France, the Netherlands and northern Germany, having separable stops of varying colours and pitches, though being more likely to have but a single keyboard. The influences were Flemish rather than Italian – a Pedro Flamench ('Peter the Fleming') was at work in Barcelona in 1540 – and even the term 'Fleutes' for Principals (a later term was Flautado) was Flemish. Principals and Mixtures (Mixtura, Forniment, Simbalet) were the stop-changes or *mutaciones* available on the new big organs of 1550, as they had been earlier in the north, although positives were already showing an array of slider-stops, including regals, reeds and wooden flues. Evidently Flemish builders brought Chimney Flutes and Quintadenas with them, and by the

1550s new large organs of splendid proportions could be expected to have large-scaled reed stops. Often these reeds had colourful names: Trompetas naturals a la tudesca ('German or Dutch trumpet stops with natural-length resonators'), Clarins de mar ('trumpets of the sea', as used for naval signals) or Clarins de galera, molt sonoroses ('gallery trumpets, very sonorous') at Lérida in 1554. Although none of these was horizontal, the terms are evocative and probably played their part in the later evolution of the remarkable Iberian reed stops.

Just as Flemish singers were called to Felipe II's court chapel in Madrid, so Flemish organ builders were commissioned (notably members of the Brebos family), putting into practice their up-to-date ideas at El Escorial. The Brebos organ had a large *Hoofdwerk* of two chests and big flue and reed choruses, as well as flute mutations; the pedal was similarly a large modern department. But the only other manual was a *Brustwerk* (though one of 12 stops), and indeed Chair organs were never to become important in Spanish organ building, although the *Cadireta* (both interior and exterior) was later to become a common secondary division. Barcelona seems to have been a centre for northern European builders, but registrations left at the monastery of Sant Joan de les Abadesses in 1613 show the stops to have been used in a traditional or old-fashioned way, and during the 17th century emphasis shifted south and west.

Regals may have been the first reed stops to be placed horizontally in Iberian organs (in the manner later known by the French term EN CHAMADE), but in 1659 the builder

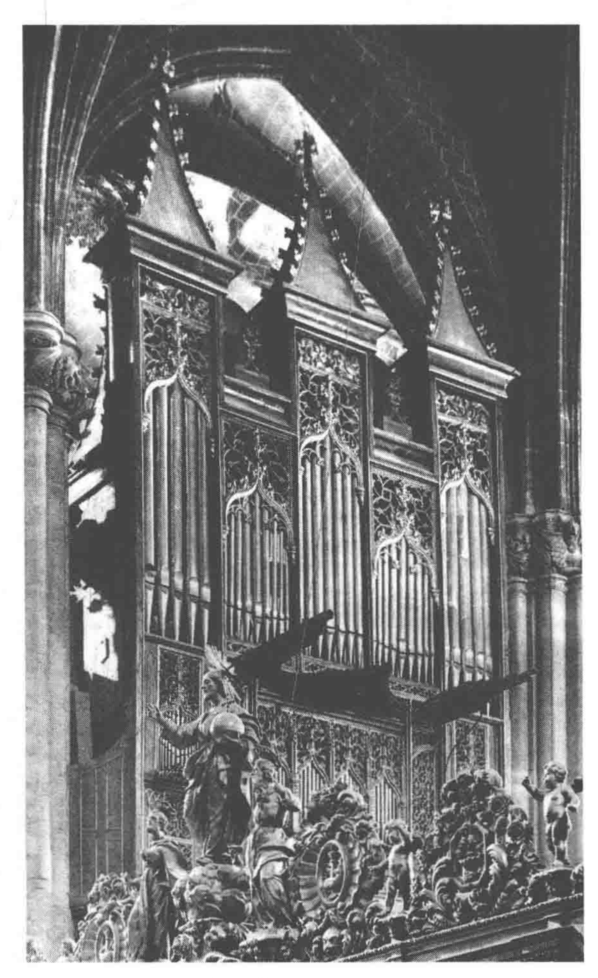
39. Organ with reeds placed horizontally in the convent of S Maria, Arouca, Portugal

Echevarría placed a full-length Trumpet (Clarin) horizontally in the façade of his organ in Alcalá de Henares, boasting that he was the first to do this. Placing reeds horizontally in the case front was convenient for sound (penetrating in big churches where the organ did not face the congregation), accessibility (for quick tuning), reliability (gathering little dust), economy (replacing cathedral trumpeters) and appearance (fig.39). But the documents Trarely specify whether reeds were horizontal or not, just as documents before the end of the 18th century rarely specify whether or not 'Eco' chests or interior Trumpets and Cornets were placed in a box. Reeds were plentiful: in addition to the Clarins ('mounted like cannons' in the cornice), Echevarría's organ contained Trompetas reales ('of which there can be three kinds'), Dulzainas, Orlos (resembling 'the guitar and harpsichord' (*zitara y clavicordio*)), Trompeta mayor ('a stop found in few other organs'), Bajoncillos ('also newly invented'), Vozhumanas and *Angeles o Serafines* (angel statues blowing trumpets). By 1750 a large organ would have a huge battery of reeds, vertical and horizontal, many kinds of chorus, large Swell

40. Rear façade of the Epistle organ of Granada Cathedral, 1745–7, with tiers of dummy pipes or flats, and a single rank of reeds en chamade (8′ treble, 4′ bass); note the low cut-up of the mouths of the large pipes to right and left

departments and even a pedal rank or two. The well-known organ of Granada (fig.40) can be taken as an example; its stop-list is given in Table 21. No large Spanish organ can be called fully 'typical'. As in Italy during the next century, the larger the organ, the greater the variety of solo stops; the large organ of Toledo (1796), however, shows no advance on the concept of smaller organs built nearly a century earlier.



A few registration guides for Spanish Baroque organs have been found. One, for an instrument made at Segovia Cathedral about 1770, suggests the few staple requirements organists made of these extravagant creations. They comprise French-style 'dialogues' (two-part pieces with mutation stops or reeds in each hand), regal solos (e.g. Dulzaina in either hand), half-stops for each hand on the same manual, echo effects and manual contrasts for two- or three-part music, flutes contrasted with reeds (perhaps for use in homophonic music), inner vertical reeds with outer horizontal trumpets, cornets and reeds 8′, 4′ or 8′, 2′ combined. Because organs of this period contained many halved stops (*medio registro*), the right hand could produce a line lower than that of the left hand, or one very much higher, and this feature characterizes much of the music of the time. The Echo box is also mentioned, not for swelling but to mute the effect of certain registrations. Pedals are ignored.

Over the whole period, the bellows of the Iberian organ were usually multifold and operated by hand. Wind pressure was low (*c*50–60 mm), though up to 90 mm on larger instruments. The chests were always slider-chests, usually divided into bass and treble, either between *B* and C (usual in the south) or C and C♯ (usual in the north). As in French organs, the pallets are directly above the keys (suspended action). The chest layout is often very complicated, each group of stops set on channelled-off subsidiary chests, terraced at different heights, easy to tune and reach, and often some way removed from the pallet. Neither bellows nor trunks and channels allow the families of stops to be combined, but the rigidity of registration enabled builders to include helpful accessories like knee-operated 'shifting movements' to aid stop-changes. Secondary divisions are often placed on the floor of the main case (*Cadireta interior*) and operated by a sticker action; if there is a Chair organ (*Cadireta exterior*), the pallets are below and directly in line with the lower keyboard, and the channels pass below the closely placed organist's seat. A middle manual may operate pallets of a pair of chests placed in the rear case-front of the organ, facing the side aisle. There are no manual couplers. Pedal keys are short, sometimes mushroom-shaped, usually encompassing eight or ten notes, as in Italian organs; there may be a rank of wooden pipes but most pedals are pulldowns, presumably for organ points and cadences. The hinged lid of the Echo box – known to contain a Cornet by about 1675 but including reeds by about 1710 – was raised by a pulley and rope operated by a pedal-lever that needed to be kept down if the lid was to remain open.

The scaling of the Principal is often narrow, the tone restrained; flutes are gentle, and Cornets expansive but thinner than the French. The quiet flutes contrast greatly with the reeds, which were designed to fill the spaces of a large Spanish church outside the immediate intimacy of the quire or *coro* over which the organ looms. Reeds and regals, and divided stops in general, encouraged solo music, and Correa de Arauxo's *Libro de tientos y discursos* (1626) shows a matured technique of left- or right-hand solos, a technique similar in effect to other 17th-century dialogue music such as the English double voluntary and certain French pieces (*Basse de trompette*). The reeds also played chords, not only for the celebrated *batallas* (battle-pieces) but also for imposing intradas on feast days.

At Zaragoza (extant case dated 1443; fig.41) organs were already placed between the pillars of the quire of the church. It was probably this position that encouraged large flat façades bearing little resemblance to the inner construction of the organ itself, indeed often giving it the appearance of having more chest levels than it has. The amount of empty space within a Spanish organ absorbs strong partials in the *plenum* and helps to produce the mild quality of the flue choruses.

No account of the Iberian type of organ would be complete without some mention of its manifestations in the New World. Imported organs, at first small, are recorded in Mexico not long after the Conquest, before the midpoint of the 16th century; by the end of the 17th century there are numerous records of organs being both built and played by native Mexicans who had been taught by Spanish priests. In 1624 it was recorded that 'no Augustinian church lacked an organ', and that promising

41. Organ in the cathedral of La Seo, Zaragoza, 1443; the reeds en chamade were added possibly in the 18th century

youths from each village were being sent to Mexico City at community expense to study music and organ playing. From this period to the late 19th century virtually all organs in Mexico were locally built. One notable exception is the large Epistle organ in Mexico City Cathedral, built in 1693 by Jorge de Sesma of Spain and first used in 1695. Its main manual has over 30 divided stops, with smaller *Cadereta* and *Positivo* divisions playable from the secondary manual. In 1734 José Nassarre, a Mexican who had already constructed a sizable organ in Guadalajara Cathedral, enlarged the *Cadereta*, and the following year he completed an organ of similar size on the Gospel side of the quire, which had an additional 27-note *Recitativo* enclosed in an expression box. Both organs have survived neglect and fire, and were restored in 1978 by the Flentrop firm. Many Mexican builders of the 17th century are anonymous, but in 1738 the first of several generations of Castros established a workshop in Puebla, and significant work of this family survives in the area. In 1786 Manuel Dávila was advertising that he built organs tuned in equal temperament, and in the early 19th century José Antonio Sanchez and Manuel Suárez were active in the Taxco area. Even at the end of the 19th century, Mexican-built organs were conservative in nature, generally following the 18th-century Iberian pattern of a single-manual instrument with treble and bass stops, housed in ornate casework often of considerable artistic distinction. The late 19th and early 20th centuries saw the decline of the Mexican organ-building school and increased importation of German, Italian and, to a lesser extent, American and French instruments. Many native Mexican organs were allowed to go to ruin, but since the restoration of the Mexico City Cathedral organs funds have been made available through the Patrimonio and private foundations to make possible the restoration of a number of significant instruments. Although Mexican organs became well documented and studied in the final decades of the 20th century, little is still known about those elsewhere in Latin America other than that significant numbers of older organs have been reported, especially in Peru.

10. THE 18TH-CENTURY ITALIAN ORGAN. The essentials of the Brescian classical organ were established by 1575 at the latest: large, shallow cases (somewhat altar-like in shape, open-spaced above the pipes), with one chest at the level of the case pipes (spring-chest, mortised with well-spaced channels often of equal size), and multifold bellows and low wind pressure. The compass would rise to a'' or c''', with all but case pipes of metal with a high lead content (thick-walled, principals relatively narrow in the bass, flutes wider with smaller mouths) and completely separate ranks (the upper of which break back an octave at regular intervals). The tuning would be some form of mean-tone temperament, but the general pitch level would vary from organ to organ ('come si vuole', as Antegnati remarked), as indeed it did throughout Europe. Sometimes there was an octave or so of pedal pulldowns (short keys sloping up slightly; 'pedali a leggio'), and occasionally after about 1600 with thin-walled wooden Pedal Principals. Registration was standardized, and each combination suggested to the player a certain modal style to be played at a certain moment of the Mass (e.g. 'Voce umana' for the Elevation), as set forth by Banchieri (*L'organo suonarino*, 1605) and others.

Italian builders and organists remained faithful to these ideas, modifying them gradually but leaving them recognizable even in the large organs of the 1850s. Yet it could be that historians have overemphasized the Brescian organ, for each city or region had its own version of the general plan. The Flemish builder Vincenzo Quemar had already introduced stopped pipes (Flute $2\frac{2}{3}'$), Chimney Flute (2′), conical flute ($1\frac{3}{5}'$), reeds (Tromboni 8′) and regals (Voce umana 4′) at Orvieto Cathedral by 1600, as well as a Tremulant and an aviary of toy stops. Less than a century later, another German (the Silesian Eugen Casparini) was introducing Mixtures and even Cornets in organs of the Tyrol, as well as confirming the trend towards the German-French C–c''' compass, and the Fleming Willem Hermans had a strong influence in Tuscany. But indirect Italian influences appear to have been strong elsewhere early in the 17th century, notably in Provence and Jesuit Poland (conventual churches). Second manuals remained the exception, and the one made by the Dalmatian builder PIETRO NACCHINI for S Antonio, Padua, in 1743–9 presented a character little different from that of S Maria in Aracoeli, Rome, in 1587: I Ripieno, Voce umana, two flutes, Tierce, regal; II Ripieno, Voce umana, one flute, Tierce, regal; Pedal 16′. As builders began collecting the upper Ripieno ranks on to one slider, a Mixture resulted that was not so different from a French *Fourniture cymbalisée*. A particular taste grew during the 18th century for Tierce or (as they were called) Cornetto ranks, but these had already been included in some two-manual registrations written down in Rome in 1666. Moreover, during the 18th century large, experimental organs were built on special commission, spreading new ideas from Bergamo to Sicily. Toy stops remained an important element in Italian organs. Although rivalry with the fine organs 'at Marseilles, Trent and Hamburg' may have been the motive behind the five-manual organ at S Stefano dei Cavalieri, Pisa (Azzolino Bernardino Della Ciaia, 1733–7), and elsewhere, the result was peculiarly unlike any of them. The 1730s may have seen a parting of the ways when builders throughout Europe were developing techniques beyond musical requirements; but the five-manual, three-console, 55-stop organ at Catania, Sicily (Duomo del Piano, 1755), though admired and even copied in the next century, was little more than an accumulation of several classical Italian organs, collected together, and it was decidedly atypical. The effect of Spanish rule on the Kingdom of Naples has yet to be explored from the point of view of organ building, but it seems doubtful whether Spanish influences ever went further east than the Balearics.

A characteristic and influential organ type of the later 18th century was the Venetian, brought to fruition by Nacchini and his pupil and successor Gaetano Callido. The Callido firm built hundreds of single-manual organs and many with two manuals (the pipes of the second being enclosed in an expression box from about 1785), all of excellent workmanship and summing up many of the 17th- and 18th-century trends, discarding the more extravagant elements, giving their organs a velvety, vocal tone far removed from Antegnati; indeed, in their wide-scaled Principals they influenced many a so-called *Italienisch Prinzipal* in modern German organs. The stop-list of an instrument by Callido is given in Table 22; for ease of tuning, the regal (Tromboncini) stops were placed in front, standing vertically before the Principale (as they

did in other Italian organs of the period). Registrations provided by Callido elsewhere show orchestral imitations to have been important to organists of the period; there is no subtle play of two manuals, and in general swell shutters seem to have been used either quite open or quite closed, rather than expressively.

Research by Umberto Pineschi during the last two decades of the 20th century into the important Tuscan school and the influence of Willem Hermans thereon, together with the work of the state-sponsored restoration workshops at the Palazzo Pitti in Florence, has added to the knowledge of the Italian organ and to the preservation of its heritage.

11. THE ORGAN OF J.S. BACH. In many ways the organs of Bach's main area of activity, Thuringia, Weimar and Leipzig, showed the same kind of influences as his music: a basic German traditionalism tempered with French colour and Italian fluency. Neither the organ nor the music was as local in origin or as independent of other regional ideas as was usually the case elsewhere, even in the mid-18th century. Bach himself is known to have been well acquainted with organ music of many countries and periods, as were such contemporaries as J.G. Walther; later colleagues, however, seem in some respects to have had less wide knowledge. C.P.E. Bach's remark that his father registered stops 'in his own manner', 'astounding' other organists, might conceivably refer to either a French or a 17th-century north German approach to stop-combination, one not known to players of the younger generation, who thought that 'the art died with him'; however, one must be careful not to read too much into this remark. On the other hand, J.S. Bach is said to have complained that Gottfried Silbermann's mixtures were 'over-weak', with 'not enough sharp penetration', which might suggest that he did not appreciate that Silbermann's French *plein jeu* was different in function from a north German *organo pleno*, being one of the many colours rather than a total chorus. Moreover, the period in which Bach worked was one of a changing aesthetic for organs, when the large west-end organ became increasingly associated with congregational hymn singing, requiring big chests, large bellows capacity, many 8′ stops (including those of string tone), a powerful 16′ pedal tone for 'gravity' and a range of sound characterized more by extremes of loud and soft than by a full array of equal, piquant colours.

Apart from the qualities of his music, then, the position of Bach in organ history is important, and can serve to show some of the currents affecting the flow of German organ music. In the course of two centuries, the area between Hanover and Breslau produced great builders (the Fritzsche and Compenius families, Casparini, Silbermann, Joachim Wagner, Engler, Hildebrandt, Trost and Schulze) and some even more influential theorists (Praetorius, Werckmeister, Adlung, Agricola, Marpurg, Sorge, Knecht, Seidel and Töpfer). Its composers included many who travelled to hear and see great organ traditions elsewhere (for example Bach, who went to Lübeck to hear Buxtehude and to Hamburg to prove his ability on a Schnitger organ) or who settled down in another part of Germany and formed schools of keyboard playing around them (Froberger, Pachelbel, C.P.E. Bach). Many details of the stop-lists of J.S. Bach's organs at Arnstadt (1703–7), Mühlhausen (1707–8) and Weimar (1708–17) remain unclear, as do larger matters of registration and tonal effect; but fine restorations during the 20th century of organs by Trost and other builders contemporary with Bach, along with the increased accessibility of Thuringia and Saxony since 1989, has helped considerably in the understanding of these matters and in the dispelling of many *Orgelbewegung* misconceptions. The Arnstadt organ (Table 23) can be taken as typical, one known by the Pachelbel school as well as Bach's family. The particular kind of second manual on this instrument, the pedal department, and the range of 8′ manual colours had long been traditional in this part of Germany, and in style the Weimar court chapel organ followed much the same patterns.

Larger church organs began to allow for new attitudes towards the *plenum*. When Bach was a student in Lüneburg in 1700 or visited Lübeck in 1706 organists there would not have 'mixed the families' of organ stops by drawing more than one rank of any given pitch even on the larger organs. As Werckmeister had written in 1698, organists should not draw two stops of the same pitch, because wind-supply and tuning problems would prevent them from being fully in tune together; but by 1721, shortly after Bach's visit to Hamburg, Mattheson was suggesting an *organo pleno* of all stops except reeds – Principals, Bourdons, Salicionals, Flutes, Quintatöne, Octaves, Fifths, Mixtures, Tierce, Sesquialteras etc. The significance of any remark made by Mattheson, or its precise meaning, is often a matter of conjecture, but after the midpoint of the century Adlung and Agricola both seem to have supported the idea of mixed stops. Adlung thought that good modern bellows ought to allow an

organist to draw Manual Prinzipal 8′ + Gedackt 8′ + Gemshorn 8′ + Rohrflöte 8′ with Pedal Contrabass 32′ + Posaune 32′ + Sub-Bass 16′ + Violon 16′ + Posaune 16′ + Oktave 8′ + Gedackt 8′; and composers such as Gronau drew Prinzipal 8′ + Flute 8′ + Oktave 4′ + Flute 4′ + Salicet 4′ + Trompete 8′ + Oboe 8′ to bring out the melody of an organ chorale. Thus, during Bach's lifetime, ideas about what constituted Full organ were in the process of changing, as were ideas about the number, kind and use of solo stops and combinations, as illustrated in Kauffmann's *Harmonische Seelenlust* of 1733–6.

In Lüneburg, Lübeck and Hamburg Bach would have heard organs with *Rückpositive*, but after about 1710 such divisions were rare in new instruments of his own area and further south; some cities had not known them since about 1650. The *Rückpositiv* at Mühlhausen already had a stop-list (8.8.4.4.2.2.$1\frac{1}{3}$.?II.III) quite different from the bright, colourful manual of Dutch and French organs, and, where gallery space was sufficient, builders preferred to hold such second-manual chests within the Great case, usually above the Great. The resulting *Oberwerk* was thus different in origin from that of Niehoff and Schnitger. At the same time pedals became progressively less able to provide solo colour for cantus firmus music, itself a dying genre; and organs took on a stereotyped character that varied only if the builder was sensitive to different voicing and scalings demanded by different church acoustics.

The privileged organ builder to the court of Saxony was Gottfried Silbermann, a native of Saxony who was apprenticed to his elder brother Andreas in Alsace and returned to make the friendship of such composers as Kuhnau and Bach. Silbermann's early organ in Freiberg Cathedral, Lower Saxony (1710–14; now restored), already demonstrated many of these developments (Table 24). Here was not a mass of clumsy auxiliary stops but a unique blend of Saxon and Alsatian-French elements, full of well-thought-out balance between the three manuals, and implying a mode of registration needing to be learnt carefully by the organist. Silbermann's voicing is strong, particularly of the Principals; his smaller village organs have great power and energy. Wind pressure (as in Joachim Wagner's organs) was *c*94 mm (manuals) and *c*104 mm (pedals) in later organs, about 10 mm higher than that of good large organs of about 1700.

There is little direct connection between any of Bach's organ music and such instruments as that at Freiberg; but were the Trio Sonatas, for instance, known to the organist of such a church, he may well have drawn for lively movements the combination of stops noted by the local priest as having been recommended for Silbermann's Fraureuth organ (1739–42) for *jeu de tierce en dialogue* (called *Tertien-Zug zweystimmig*): right hand Prinzipal 8′ + Rohrflöte 8′ + Oktave 4′ + Quinte $2\frac{2}{3}$′ + Prinzipal 2′ + Tierce $1\frac{3}{5}$′; left hand Gedackt 8′ + Rohrflöte 4′ + Nasard $2\frac{2}{3}$′ + Oktave 2′ + Quinte $1\frac{1}{3}$′ + Sifflöte 1′; and Pedal Sub-Bass 16′ + Posaune 16′. Given a free choice, as he may have been in the design for Hildebrandt's large organ at St Wenzel, Naumburg (1743–6; restored in the 1990s), Bach might well have chosen to combine the features of several organ types: three manuals including *Rückpositiv*, 53 stops including Cornet and solo pedal stops, and each manual designed as an entity with its own auxiliary stops (Viola, Fugara, Gamba, Unda maris, Weitpfeife, Spillflöte etc.). As in all organs frequently played by Bach, Naumburg had several string-toned stops, either narrow

cylindrical or conical, and various sources, including Bach himself, suggest that they were used not only in chorale preludes, but in continuo work. Tierce ranks, alone or as constituents of the Sesquialtera-Cornet, were indispensable for solo melodic lines in an organ chorale. Manual reeds were never numerous (even at Naumburg they accounted for less than 10% of the manual stops) and were, except Vox humana and Krummhorn, for chorus purposes, although pedal reeds at 16′, 8′ or both are found even in organs of moderate size. The Mixtures at Naumburg were more in the bright German tradition than Silbermann's *pleins jeux*, and the pedal reeds (32′, 16′, 8′, 4′) had something of Silbermann's élan. A contemporary critic of one of Hildebrandt's organs in Dresden thought its tone dull and heavy, owing to increased wind pressure, higher cut-ups, and new voicing methods in general which spoilt the Praetorian 'Lieblichkeit der Harmonie'. But such factors were characteristic of the new mode of the 1730s and 1740s in general, and 'gravity' in an organ was praised by Bach and others.

In view of the cross-currents in German organ design from 1700 to 1750, it is not surprising that Bach should have left only a few registrations, and those only of a general nature. The published Schübler chorale preludes (*c*1746) make it clear whether the pedal is a 16′ quasi-continuo bass line or a 4′ cantus firmus melody line, but they do not specify colour. The manual Prinzipal 8′ and pedal Trompete 8′ registered in the autograph manuscript of the *Orgelbüchlein* prelude BWV600 are there as much to indicate that the canonic voices are to sound an octave apart as to suggest actual stops to be drawn. For a concerto or a prelude and fugue it is rarely clear on whose authority the manuals (and particularly the manual changes) have been specified in the manuscript copies. The subject is thus open to many solutions and suggestions. But on no single organ that Bach is known to have played would all his organ music have sounded at its best or been given a registration suitable to its carefully conceived style and genre.

12. Splendours of Europe, 1650–1800. Between 1725 and 1750 a large number of important organs were built: the great organs of Haarlem, Gouda, Weingarten, Herzogenburg, Naumburg, Dresden, Breslau, Potsdam, Uppsala, Catania, Pisa, Tours, Paris (Notre Dame), Granada and Braga. All these and many other organs of their type were designed both to fill their churches with big sound and to tickle the ear with delicate effects. Neither purpose was known to the 16th-century builder. The very tendency to build organs exclusively at the west end of the church pinpoints this move towards extremes of sound, for apart from the large conventual churches, and larger French parish churches, the new west-end organ was the only instrument in the building, especially in Protestant countries, where the need for a smaller auxiliary organ in the liturgy had largely disappeared and choirs, if any, occupied the west gallery. The generation of builders who produced the even bigger, later organs of the 18th century (Toledo, Saint-Maximin-la-Sainte-Baume, Hamburg Michaeliskirche, Rostock Marienkirche, Arnhem, Nijmegen, Amorbach, St Florian and Oliwa) or theorists who planned yet bigger ones (Vogt, B1719, and Bédos de Celles, B1766–78) were mostly seeking to exploit the same extremes.

Earlier, however, characteristic national developments had frequently resulted in organs which, though conceived within classical limits and not, as it were, stepping outside idiomatic, traditional usage, nonetheless had greater potential than their composers seem to have been aware of, although improvisation was widely practised, an art of which we have little concrete knowledge in this period. Thus the problem with organs of 1650 to 1750 is to know for certain what they were meant to play and how they were meant to sound, whereas the problem with organs of 1750 to 1850 is that the music for which they were built, often with great ingenuity and unsurpassed technical skill, may be difficult to admire.

Two good examples of the northern organ about 1650 are at Klosterneuburg and Alkmaar; both retain many features of their originals in spite of extensive rebuilding. Much is still unknown, however, of the detail of the originals, and it is necessary to rely on the stop-lists, given in Table 25. At Klosterneuburg neither the *Brustwerk* nor even the *Rückpositiv* competes with the main chest (*Hauptwerk* and Pedal), either in sound or in appearance. The *Hauptwerk* dominates the ensemble, in the true 16th-century tradition of central Europe; perhaps it, not the pedal, was originally meant to take the 16′ pipes in the case. The instrument should be seen not so much as a three-manual organ but as a group of three independent organs: *Hauptwerk* for postludes etc., *Rückpositiv* for interludes, solos and major accompaniments, *Brustwerk* for continuo. It is uncertain whether the organ originally had manual reeds, other than the Regal; but mutations are also few, and colours were obtained by a variety of 8′ and 4′ ranks. 8′ colour stops were becoming very popular throughout the area Vienna–Ulm–Prague–Vienna, and on paper the main chests of such organs often appear misleadingly large. 14 out of 28 stops at the Týn Church, Prague (J.H. Mundt, 1671–3), were on the *Hauptwerk*, 16.8.8.8.8.8.4.4.2⅔.2.1⅓.1.VI.IV, but four of the 8′ stops were colour changes, not chorus ranks. Salicional 8′, Viola 8′ and similar stops were characteristic of late 17th-century Habsburg Europe; Salicet 4′, Fugara 4′ and Dulciana 4′ were common by the early 18th century; and reeds, except a pedal rank or two, gradually disappeared. Theorists like the Cistercian writer Vogt (B1719) emphasized 8′ colour stops; and for such registration rules as those given by J.B. Samber (*Manuductio ad organum*, i, Salzburg, 1704), the conical Viola 8′ was useful in many varied combinations: continuo playing, Viola 8′; fantasias, Viola 8′ + Flöte 4′; fugues, Viola 8′ + Mixtur III; versets, Viola 8′ + Zimbel II.

Soon after the organ at Klosterneuburg, organ cases in the area became divided into a kind of Habsburg equivalent of the *Werkprinzip* design, with one case for the *Hauptwerk*, one for the Pedal and one for an Echo chest (Waldhausen, 1677). Such division led over the years to a rigorously applied design followed by most Austrian organs of the mid-18th century, with a half-case to one side of the west-end gallery (*Hauptwerk*), a second half-case to the other (Pedal) and a *Rückpositiv* in front, the total gallery being spacious enough to accommodate a considerable choir and orchestra for the Mass on feast days. By 1740 or so, the keyboards would be placed (in the form of a detached console) in a commanding position on the gallery floor, and the various parts of the case strewn around the west-end windows, as in the large monastery organs of Ochsenhausen, near Biberach, or Weingarten. In theory such an arrangement might have

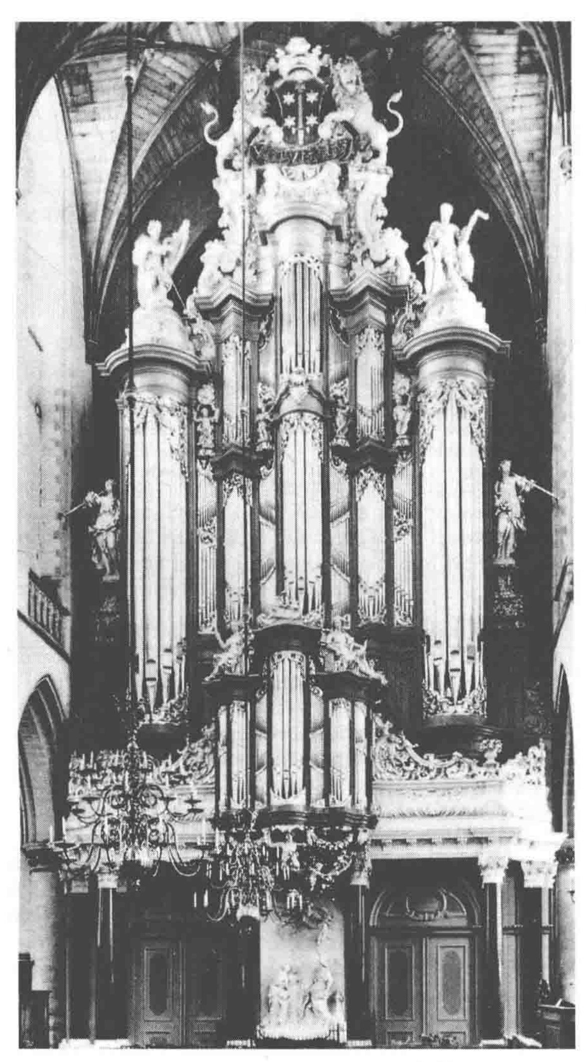
encouraged idiomatic, two-chorus organ music of the north German type, but in practice it did not.



Little is known about the music played on the great series of Dutch organs built between the death of Sweelinck (1621) and the vogue for Bach's music two centuries later. But the array of mutations and flute and reed colours on the Laurentskerk instrument at Alkmaar would have made possible an immense variety in the settings of, and variations on, psalm tunes (probably improvised, as they are today). In the 1685 rebuild the *Hauptwerk* chest had to be lowered (fig.42), perhaps because by then the organist wished to be able to accompany the congregation during hymns (but such accompaniment was then still new). It is clear how the Alkmaar organ developed from the Brabant organ of Niehoff with its limited pedal, big *Hauptwerk* chorus, 8' *Rückpositiv* used for solo effects, and a quasi-*Oberwerk* (here placed below the main chest, however) with stops found on the main manual of other European organs. According to John Evelyn's diary, such Dutch organs were used 'only for show and to recreate the people before and after their Devotions, while the Burgomasters were walking and conferring about their affairs'. By association, then, the organs were secular, often indeed owned by the town council, who saw such magnificent creations as objects of rivalry. Hence the building of the organ at St Bavo, Haarlem, by Christian Müller (1735–8) is to be seen as a sign of competition with Zwolle (Grote Kerk; new organ by Schnitger's sons, 1718–21), Alkmaar (rebuilt 1723–6), Amsterdam (Oude Kerk; Christian Vater, 1724–6), Gouda (Jean Moreau, 1733–6) and elsewhere. Moreau was from the south; but Müller, Vater and F.C. Schnitger were German, and from then the Dutch organ was dominated by German builders who imported new ideas (big pedals from Hamburg, heavy voicing from Westphalia), added them to Dutch features, and produced large, powerful instruments, but unfortunately

42. Organ by Livin Eekmans and Germer Galtisz. van Hagerbeer, 1639–45 (case by Jacob van Campen), St Laurentserk, Alkmaar

often without either German brilliance or French éclat (thin reed trebles and a Cornet designed to outline the psalm-tune melody rather than to function in a *grand jeu*). Marcussen mistakenly tried to 'correct' the organ at Haarlem in 1961 with new pedal Mixtures and a new Great Mixture which attempted to convert the 16′ to an 8′ chorus and which was reversed in the 1980s. Although such tonal matters are subjective, the cases themselves can be more clearly seen to have lost their native Dutch characteristics, particularly the well-featured, classical designs of the 17th century, and to have begun to sprawl. It is true that, at Haarlem, Müller and his architect kept the traditional vertical emphasis and other essential details in the arrangement of towers and flats; but even there the classical pediment surmounting the best old Dutch cases gave way to an unstructural, Baroque coat-of-arms (fig.43).

Although the condition of the organs at Weingarten and Haarlem is nothing like as authentic as their fame leads admirers to assume, they do serve on paper (Table 26) as useful examples of their 'schools', being at once both traditional and exceptional, both formative and unapproachably 'ideal'. The details of the Weingarten organ – the bells, the cherrywood stops, the ivory pipes, the doubled ranks, the undulating stops, the big Mixtures, the complex action – require a book to themselves, and it could be that a first-rate restoration of the instrument would fill out its tone. Nevertheless, the principles behind its dispensing of organ colours can be seen, and Gabler's little quire organ in the same church contained an even clearer indication of his passion for 8′ and 4′ colour stops. Some writers have described the west-end organ as a 'Rococo-Gothic conception', but it is more like a southern European grotto organ. Three echo-like divisions (*Oberwerk*, *Unterwerk*, *Kronpositiv*) are bound to lead to a mocking of true organ tone, however logical an extension it may have been of current ideas in south Germany as a whole. Only the two *Rückpositive* offer well-balanced effects in the idiomatic north German manner; yet to an 18th-century organist visiting Weingarten after Salzburg Cathedral (organ by J.C. Egedacher, 1703–6) such *Rückpositive* must have seemed conservative and slightly puzzling. The original mechanical action must have been very troublesome to make, since even in this sprawling and unique case (fig.44) only eight of all the case pipes do not speak; clearly the detached console was the only practical arrangement. The influence of the whole instrument was wide and long-lasting; theory books (e.g. *HawkinsH*; Bêdos de Celles, B1766–78) gave it notoriety, and it held a significant position between the colourful Renaissance organ of south Germany and the large factory organs of the 1830s.

43. *Organ by Christian Müller, 1735–8 (case probably by Jan van Logteren), St Bavo, Haarlem*

Swabia also saw a remarkably good compromise organ during the 1760s: the larger instrument at Ottobeuren, built by K.J. Riepp (1761–8), incorporated French elements (learnt by its builder in Burgundy) and German ones (learnt in the vicinity of Lake Constance). Most major organs in both parish and conventual churches in Switzerland, Württemberg and Bavaria had such a mingling of organ cultures as to create distinct styles of their own; but the one at Ottobeuren was a simple amalgam. All the classical French registrations were possible on it, but so were German pedal music and hymn variations, from the evidence of its stop-list.

Such composite schemes were curiously rare in the 18th century. It was more characteristic of organ building in general that even adjacent areas (e.g. Carinthia and Veneto, or Saxony and Bohemia) had totally different organs, as if builders of one area or religious denomination were thoroughly opposed to the ideals of their neighbours. Some of the major religious orders, particularly the Cistercian and Augustinian, had something of an international style crossing political frontiers, but even this kind of uniformity was not conspicuous. It was regional style that carried the day, giving the organ at Klosterneuburg, for example, great influence over the one built nearby a century later by a foreign builder well versed in other organ types (Augustinerstift, Herzogenburg; J. Henke, 1747–52). It may well have been such provincialism, however, that helped to produce the good, conservative designs (Amorbach; Rot an der Rot), the late flowers of Baroque organ art that were able to resist the extremes of fashion.

The large organs of the late 18th century were individually distinctive, keeping regional characteristics despite the availability to organists of many printed sources of music from other countries. In Hamburg

the Michaeliskirche had a 70-stop, three-manual organ by J.G. Hildebrandt (son of Silbermann's pupil Zacharias Hildebrandt); although he took with him many Saxon colours (Cornet, Unda maris, Chalumeau etc.) and followed contemporary ideas common to many regions (no *Rückpositiv*, thickening Quints etc.), the instrument remained a Hamburg organ, more complete and comprehensive than an organ could have been anywhere else. The massive case (for which Burney did not care) has an appearance that anticipated the 19th-century; the stoplist (Table 27) is typical of a large organ, but many writers who heard the instrument commented on its 'noble power', described by Burney as 'more striking by its force and the richness of the harmony than by a clear and distinct melody'. Yet the organ was no mere sacrifice to fashion, which was then rather geared to imitations of orchestral families, of wind concertos, and the like. Theorists like Hess and Knecht encouraged particular imitations of string stops and in general helped to deceive organists into thinking they could duplicate orchestral effects. So did G.J. Vogler, who typifies the less reputable side of late 18th-century organ playing, and whose bizarre organ-concert programmes sometimes proved irresistible to popular audiences in large cities from London to Vienna. Vogler's SIMPLIFICATION SYSTEM, however, has received more attention than it merits historically, for the development of the organ would probably have been little different without him. More important was the impasse brought about at the end of the century by the technical perfection of the late Baroque organ. Quite apart from the Napoleonic disruption, the organ historian must feel that the multiplied colour stops of St Florian and Oliwa

44. Organ by Joseph Gabler, 1737–50, in the west end of St Martin von Tours und St Oswald, Weingarten Abbey, showing the two Rückpositive (manual and pedal)

monastic churches (1770s), the reeds of Saint-Maximin-la-Sainte-Baume, Poitiers and Toledo, and the choruses of Hamburg and Rostock parish churches, all pushed the classical organ as far as it would go. A total rethinking was necessary early in the next century.

13. ORGANS IN THE AMERICAS. The first organs in the Americas were brought from Spain to Central America by Franciscan and Dominican missionaries in the mid-16th century. During the 17th century the use of organs – both imported and locally built – was widespread throughout Spanish colonial America: 17 small organs are reported as being in use in 1630 in what is now New Mexico (see §V, 9 above.) By the early 19th century small organs were used in most mission outposts, including some in present-day California. In the northern French colonies, there was a church organ at Quebec City as early as 1657, and between 1698 and 1705 a two-manual organ was imported for Notre Dame, Montreal.

The first documented use of an organ in a church in the British or German colonies of the eastern seaboard dates from 1703. A small German religious colony had settled near Philadelphia in 1694, apparently bringing with it a small positive organ, and this was lent in 1703 for use at a Lutheran ordination ceremony in the 'Old Swede's' Church, Philadelphia. In 1713 a four-stop chamber organ of the 'Father' Smith school was placed in King's Chapel, Boston; it was mentioned as early as 1708 in connection with its original owner, Thomas Brattle, by the diarist Samuel Sewall, and it may have been imported before 1700.

English organs, including some significant examples of the work of Bridge, Jordan, Green, England and Snetzler, continued to be imported in increasing numbers to the eastern coastal colonies during the rest of the 18th century. The first person known to have built an organ in the colonies was Johann Gottlob Klemm, a Saxon who emigrated in 1733 and who built several organs, the largest of them a three-manual instrument completed for Trinity Church, New York, in 1741. His work was carried on by his apprentice, David Tannenberg, who built more than 40 organs between 1758 and his death in 1804, many for Moravian churches in a small area of Pennsylvania (fig.45). His largest instrument, however, was built in 1790 for Zion Lutheran Church in Philadelphia. Other German-born builders, notably Philip Feyring, were active around Philadelphia during the late 18th century.

Tannenberg's work reflected the influence of the central German school, as transmitted by Klemm, but he also

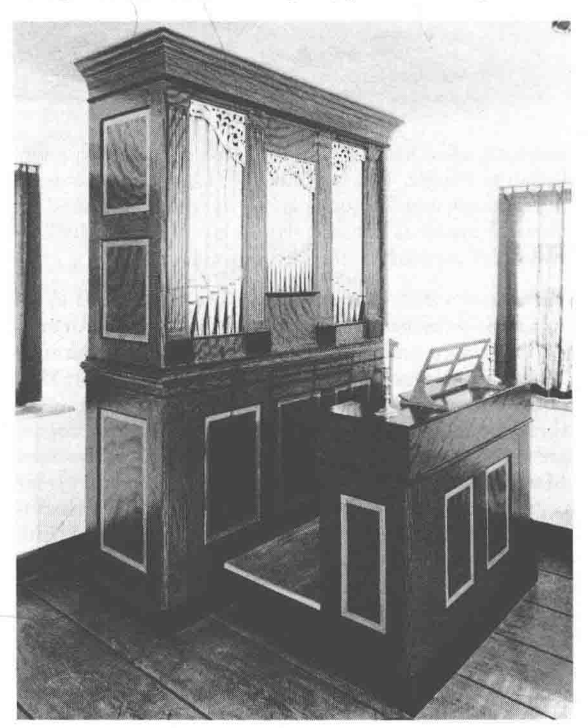
kept pace with newer European developments and was familiar with the writings of the theorist G.A. Sorge. Following in his footsteps were Conrad Doll and several generations of the Krauss and Dieffenbach families, who, culturally removed from the urban mainstream of East Coast organ building, continued to produce small organs in the 'Pennsylvania Dutch' tradition for rural churches well past 1850.

Puritan (Calvinist) objections to the use of instruments in worship prevailed throughout the northern colonies until the last decade of the 18th century, so that most of the early church organs were built for the Anglicans, Lutherans and Moravians. There is also evidence for a number of domestic chamber organs in this period. Most organs (of all types) were still imported, but after the mid-18th century a few American-built instruments began to appear in the colonies north of Pennsylvania.



The first true organ builder in Boston was Thomas Johnston, who, beginning about 1753, built a small number of church and chamber organs modelled after imported English instruments. Among his followers were Josiah Leavitt and Henry Pratt, both of whom built several small church and chamber organs, primarily for rural churches west and north of Boston. The prejudice against instruments began to break down in churches of the Puritan tradition by the 1790s, creating a new demand for church organs that was largely met by American builders.

These early New England builders were essentially self-taught and supported themselves only partly through organ building. New York and Philadelphia, however, attracted some English-trained builders during the final years of the 18th century. One of the earliest to arrive was Charles Tawse, who in 1786 advertised himself as a builder of 'finger and barrel organs' in New York. He later moved to Philadelphia, where he was joined in 1795 by John Lowe, trained in the workshop of Gray of London. The most notable emigrant, however, was John Geib, who shortly after his arrival in New York around 1798 built several substantial church organs, most of them for New York, although some went to other cities including Providence, Rhode Island.

VI. Some developments, 1800–1930

1. General influences *c*1800. 2. 19th-century technical advances. 3. Some influential organs. 4. Electricity and the organ. 5. The organ in the early 20th century.

1. General influences *c*1800. A significant amount of rethinking did not occur until well into the first half of the 19th century. In some countries, notably Italy, England, the USA, the Netherlands and Scandinavia, no significant change in direction was evident until the second third of the century; the chief difference between an average organ of 1790 and 1840 in these countries was that the latter was bigger, and the builder had probably explored further the simple colour stops, Swell boxes and pedal departments. But colour stops were by nature foreign to Scandinavian organs, pedals to English and

45. Single-manual organ by David Tannenberg, 1797 (Single Brothers' House, Old Salem, NC)

American, and Swell boxes to Dutch. In other countries, notably France, Spain, Austria, central and southern Germany and their neighbours (Bohemia, Poland etc.), events outside music not only caused organ building to stagnate in the late 18th century but ultimately gave to the revival of organs in the 1830s an impetus towards new techniques.

In Austria the reforms of church music undertaken by Joseph II during the 1780s encouraged simple organs in parish churches – instruments contrasting hugely with the large monastic creations of St Florian (1770) and Heiligenkreuz (1802). In countries occupied by the French in the wake of the Revolution, such as the Netherlands, Spain, south Germany, Austria, Prussia, Poland and Moravia, church services were often suspended. Only here and there were organs destroyed; more physical damage was done in France itself, where the Revolution was followed by a scarcity of funds and then, after 1815, an equally harmful overreaction: from 1792 a church may have been closed to Christian use but its organ was just as useful for 'awakening and inspiring a holy love of the Fatherland', as the new département administrators knew. But in southern Germany and Austria it was the dissolution of the monasteries (particularly after 1803) that changed organ tradition. In Spain and Portugal the organ suffered an eclipse, only partial in some areas but severely evident in others, taken in the wake of Wellington's and Napoleon's armies and by the reappropriation of church funds in 1830. Further north, Denmark kept its organ traditions largely undisturbed, but Sweden produced some advanced ideas in the 1820s, not least as a result of cultural ties with Saxony and central Germany.

Some of the important influences on organs and their music at the end of the 18th century were more directly musical. One was the theory of difference tones (*see* DIFFERENCE TONE), quite familiar to theorists since Tartini. Vogler's ideas were based in part on the observation that the exploitation of harmonics might enable builders to dispense with large pipes, the combination of 16′, 10⅔′ and 6⅖′ for instance, producing a 32′ effect. But the idea is essentially naive, and Vogler must have had other assets to justify the respect with which he was held in Sweden and Salzburg.

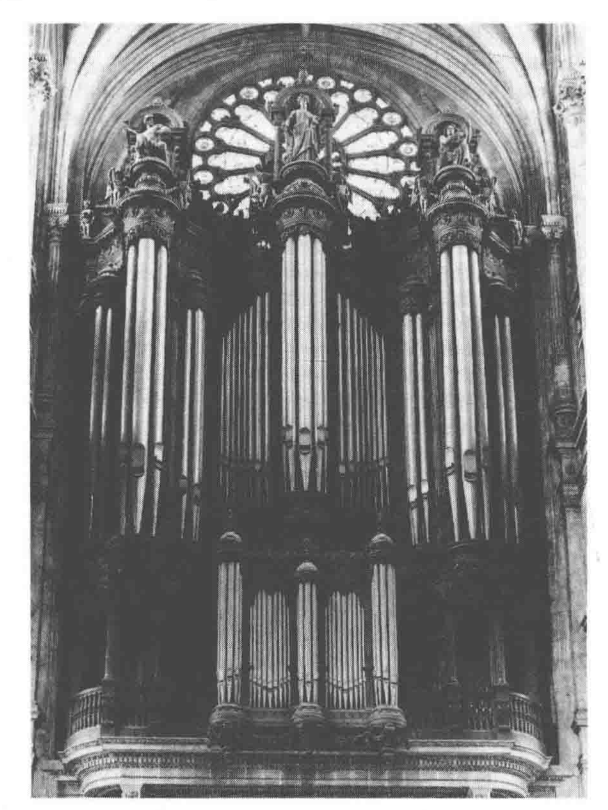
A second major influence, or a symptom of the new emphases, was the idea propounded by J.H. Knecht (1795) and others that the organ was a kind of one-man orchestra, its three manuals having an orchestral spectrum of strings, brass and woodwind. To this end, Vogler's specially made travelling organ, the Orchestrion (*see* ORCHESTRION (1)), was hawked all over Europe during the 1790s. There was of course nothing new either in stops imitating string instruments or in regarding the organ as a 'compendium of all instruments whatsoever' (Mersenne, 1636–7); nor were organ transcriptions new, being as old as written-down organ music itself. But by 1800 the orchestra itself was heavier, more stratified and conventionalized, and, most significantly, more expressive than it was in 1600, and imitations of it would therefore be further removed from the nature of the organ as then known.

A third factor was the general assumption that the hundreds of new parish church organs of average size required by about 1820 were to be built chiefly for the sake of accompanying the congregation, for which unison pitches, especially 8′ stops, were the most useful. This may have been partly because mutations were less carefully made in a period of quickly built organs, partly because intelligent theorists like Wilke despised Voglerian claims about harmonic stops, and partly because Mixtures were difficult to justify in theory. Some of the ill-repute of Mixtures in the period may also have been due to their all-too-common Tierce rank (particularly ill-suited to equal temperament, which was coming into use in this period in all countries save England and the USA, where it was not accepted until the 1850s). Such an organ as that at Karlskrona, Sweden (P.Z. Strand, 1827), might have got its characteristic specification, whatever its voicing, in reaction to poorly made mutations and Mixtures too often met with at the time:

I	16.16.8.8.8.4.4.2.8
II	8.8.8.4.4.8
Pedal	16.8.8.4.16

A further influence on the design of organs soon after 1820 was the more international scope of the repertory available to an average organist. In England, for example, such firms as Boosey imported an immense amount of German organ music of all kinds during the first few decades of the century, including a translation of Rinck's popular tutor, *Praktische Orgel-Schule* (Eng. trans., 1825). These imports reached their culmination in the international Bach revival. Bach sonatas and other major works ('Grand Preludes and Fugues') were available shortly after 1800. Partly in response to this, many older English and French organs, and some Italian and Spanish, were being altered by 1840: pedals added, short-compass manuals completed, second choruses added. The result, however, was not that national organ types lost their identity but that they kept it in a less overt and certainly less charming manner. No doubt this situation was in part due to the 'organ ethos' of the period: a general anti-Baroque view of organs as sombre, solemn, ecclesiastical and ecclesiological objects whose music (as can be seen from Vincent Novello's travel diaries) was expected to be more 'elevated' than the *galanteries* of the previous generation. But it prompted organists of different national schools to suppose that their organ alone was the best for Bach; countless English organists, for example, have resisted the idea that Bach did not write for the Swell pedal.

Apart from the details produced by such factors, several general observations can be made. There were strangely few magnificent organs built anywhere between 1800 and 1825, and the new big instruments of 1825–50 show a bigger break with the past than those of any other period in organ history. Casework as well underwent extreme changes in design and ornamental detail. While it is probably true that in 1830 churches spent less on their organs than they did in 1730, the later organs were in fact larger. The sounds the new organs on the Continent were expected to produce accorded with the sobriety and gloom of the post-Revolution church, although the organist had a more variegated repertory to choose from than at any previous period. Few great organ builders stand out between 1800 and 1825, and major practical and theoretical developments were left to the next generation. Some conservative areas, however, kept their traditions: the *Brustwerk* of 1898 at St Anders, Copenhagen, must be regarded as a survival rather than a revival.



In the USA, particularly in Boston and New York, a native school of builders was rapidly developing in the

early 19th century to meet the demands of the many new churches in the expanding cities and prospering rural areas. These builders, notably Goodrich and Appleton in Boston, and Erben and Hall in New York, worked in the refined style inherited from 18th-century England and may be said to have brought it to its final fruition. Attractive as their instruments often were, both visually and tonally, their musical use rarely transcended the needs of a fairly simple church service, and the music of Bach was almost certainly not attempted by American organists until the second half of the century. By the 1850s the effect of continental developments, both tonal and mechanical, was being felt, and large factories (such as that of E. & G.G. Hook in Boston) began replacing the small workshops.

2. 19TH-CENTURY TECHNICAL ADVANCES. Audsley's monument to the Romantic organ, *The Art of Organ-Building* (B1905), shows that the organ builder of about 1900 had a vast array of pipework to choose from; he also had many types of chest, action, bellows, gadgets and case designs at his disposal. On the whole Audsley was describing a high-quality instrument, but the profusion of elements he described affected the smallest and cheapest builder. Similarly, the organist's repertory was in theory immense, although in practice quite restricted, save in the case of the recitalist. It was towards these two positions of technical and musical profusion, of embarrassing choice for both builder and player, that the organ gradually moved during the 19th century.

Different areas of Europe exercised major influence at different periods, and often an individual builder advanced concepts or techniques without which the overall development would have been different. Publicity for a new idea became increasingly easy (particularly from such concourses as the Great Exhibition at London, 1851, and the Centennial Exposition in Philadelphia, 1876); builders travelled far to view developments, published (and read) papers or became associated with well-known theorists, and began to take commissions farther from home than they had been used to doing. New and rare stops were introduced into such foreign organs, perhaps sometimes for ostentation (e.g. Schulze's three-sided and cylindrical wooden pipes at Doncaster, 1862). An advanced organ of 1825 anywhere in Europe would at any rate have features gathered from various sources: from changing taste (multiple string stops), theory book notions of harmonics, quick factory methods, foreign influences (e.g. English Swells) and new visual ideas. 40 years later the amalgam was yet richer, and large organs produced in the factories of Walcker, Sauer, Willis, Hill and Cavaillé-Coll were taken all over the world.

Thus the developments about 1825 in central Germany had an influence throughout Europe, not least because English and French organs of the period were particularly susceptible to new ideas. The theorists Wolfram (B1815), Seidel (B1843) and above all Töpfer (B1833, B1843, B1855) were better known in Hamburg, Paris and London than Praetorius had been. Töpfer's new scientific description of the techniques of building (with tables and technical details for pipe-scales, wind-chambers, pallets, bellows, action etc.) were immensely useful to every new builder. His ratio for pipe-scales (*Normalmensur*, known in English as Normal Scale or Diapason Norm) was a theoretical model, not honed to the particular conditions of any church or local tradition; but it was adopted by

46. Organ by Ducroquet, 1854 (case after plans by Baltard), St Eustache, Paris

builders of cheaper, commercial organs. Better builders such as J.F. Schulze also found it useful, and in itself it is not far removed from what had been customary in central Germany.

Töpfer's calculation was that the area of the cross-section of a Principal pipe was √8 multiplied by the area of the cross-section of a pipe an octave higher. Pipe diameters therefore halved at the 17th inclusive pipe (i.e. eight whole tones above), as they had for many an organ before Töpfer (see §III, 1, above). Such a simple constant was convenient at the workbench, as were Töpfer's other formulae for calculating the wind consumption and the height of the pipe mouth. Meanwhile the improved bellows and reservoirs of his period not only allowed copious wind and constant pressure but encouraged builders to experiment with higher pressure for the pipes or with pipes scaled to either extreme. Since organists now demanded to be able to play with thicker registrations, these other formulae were at least as important as constant scalings.

Many of the experiments were short-lived. Free reeds were popular in central Germany and Alsace from about 1780 to 1850 but not often elsewhere, although Gray and Davidson used 32′ free reeds at the Crystal Palace (1857) and Leeds Town Hall (1859), and they were sporadically used as a novelty stop in large American organs as late as the 1870s. New materials, such as the cast-iron case and zinc pipes at Hohenofen (1818), became associated with poorer instruments once the novelty had worn off, and only zinc, useful for larger pipes, has stood the test of time. Solo manuals were reserved for the largest instruments, and double pedal-boards were used by Walcker in

a few of his largest organs, but octave couplers and detached consoles never lost popularity once they had gained it soon after 1830. In England, Swell boxes were constantly improved, most often with a view to reducing the closed box to a true *pp* (Hodges of Bristol, 1824), and their influence soon spread to France. In Germany, J. Wilke wrote major articles during the 1820s in the *Allgemeine musikalische Zeitung* listing experimental devices for producing Swell effects such as triple touch, operating couplers or bringing on more stops as the key was depressed; lowered wind pressure brought about by a net curtain in the wind-trunk (Vogler); 'roof swells', devices for raising the lid of Swell boxes; and 'door swells' or 'jalousie swells', the English systems of (horizontal) Venetian shutters, perhaps encasing a complete organ. For most of the century, the Swell box mechanism remained simple: horizontal shutters were controlled by a wooden or metal foot-lever to the right of the pedal keys, which had to be notched into position if the box was to remain open. With such pedals, gradual crescendo or diminuendo was impractical, and had to await the development of vertical balanced shutters towards the end of the century. Only occasionally were other systems experimented with, such as Bryceson's hydraulic system of about 1865 in which water was communicated along a lead pipe from the pedal to the Swell mechanism, but remote control of the Swell shutters did not become practical until the development of pneumatic mechanisms, and even then the French continued to favour a mechanical connection.

The resulting organ of about 1840 was usually a compromise between old and new. At Halberstadt Cathedral, for example, J.F. Schulze built a four-manual organ in which three manuals and pedal were of the large, standard classical type familiar in the later 18th century, and couplers and accessories were conventional, even to a Zimbelstern; but the fourth manual, its purpose very unclassical, played new stops in a high Echo chest:

Lieblich Gedackt	16 (wood)
Lieblich Gedackt	8 (wood)
Terpodion	8 (tin)
Flauto traverso	8 (turned wood)
Harmonika	8 (wood)
Prinzipal	4
Flauto traverso	4 (turned wood)
Physharmonika	8 (zinc) (free reed)

Such Echo organs were a luxury, like apse organs in a few English cathedrals a century later. More popular in the advanced organ of 1850 were the SOLO ORGAN, often on higher wind pressure, and the full Swell organ with its characteristic 16′ reed and bright Mixture (Henry Willis, 1855). In Germany, Swells of the distant *Echowerk* type remained popular with builders such as König (St Maximilian, Düsseldorf, 1855).

It was E.F. Walcker who is said to have invented (or improved) the cone-chest (*Kegellade*, see fig.9), which he patented in 1842. Cavaillé-Coll, Willis and other great builders rejected it, as did American builders after a brief experimental attempt by the avant-garde Boston builder Simmons in his organ for Harvard University (1859). In America, cone-chests were briefly attempted a decade later (again unsuccessfully, owing to the adverse effects of the climate) by the immigrant Moritz Baumgarten, who had trained with Walcker. But Walcker's output was immense, and certainly the boom in north European organ building meant that the more systematic a builder's concepts (and hence his workshop), the bigger part he could play in providing organs for the hundreds of new parish churches of that period. Metal-planing machines, for examples, were drawn by Töpfer and manufactured by Walcker; such machine tools provided pipe metal of great precision and uniformity, obviating all capricious and 'imperfect' elements in pipe manufacture. The Walcker firm moved to Ludwigsburg in 1820 and was able from there to command a vast area of central Europe, and eventually to export worldwide. Its organ for the Paulskirche, Frankfurt (1827–33), was highly influential, with its 74 stops on three manuals and two pedal-boards; but it too was a compromise. The 14-stop Swell was a large Echo organ, with free reeds and Dulcianas; the action was mechanical, the chests slider-chests, the couplers standard. However, the Swell mechanism was balanced, and once the free reeds were replaced by long-resonator reed stops, the specification became standard. Indeed, the whole Walcker style had great influence, from the Rhine to the Black Sea. But in 1849 (Ulm Minster) and 1863 (Music Hall, Boston, USA), Walcker monster organs still had not outgrown compromise; more thoroughly modern designs were achieved by builders less set in their ways, such as A.W. Gottschalg whose large organ for Cologne Cathedral was influenced by Cavaillé-Coll. The influence of the Walcker instrument in Boston on American organ building, already well established in its own conventions, has been much overrated. The cone-chest had already been tried and rejected, Americans continued to develop their own scaling and voicing systems (although influenced by Töpfer and other theorists and by general European trends), and the only real novelty, the free-reed stops, enjoyed but limited vogue. The importation of the Walcker organ was, in truth, an aberration, for in the period in which it was built the major American builders could and did produce large, well-engineered and tonally sophisticated Romantic organs for large churches, cathedrals and concert halls (Mechanics Hall, Worcester, Massachusetts: Hook, 1864).

In France much important work was done during the 1820s and 1830s before Cavaillé-Coll began to dominate the scene. The Englishman John Abbey went to France (at the instigation of Erard) to work in the late 1820s, taking with him the improved English horizontal bellows, Venetian Swell, balanced action and refined voicing, and rebuilding organs from Reims to Caen. His Swell at Amiens in 1833, for example, resembled a typical English Echo organ of 1750: 8.8.4.V.8.8. Further east, Daublaine & Callinet came under the Walcker influence with their free reeds, double pedal-boards and general specifications in a few large organs, but essentially Callinet and his fellow-Alsatian Stiehr remained conservative. Their small and average-size church organs retained the basic classical physical and tonal layout in the mid-19th century, but with some suppression of upperwork and introduction of Gambas and Harmonic Flutes, and with the use of free reeds with resonators, primarily in the Pedal. By 1841 Cavaillé-Coll was making overblowing stops, both flue and reed. His new scheme that year for the organ of St Denis is discussed in §3 below.

High pressure was applied to reeds in England by the late 1830s, the first well-known example being Hill's Tuba mirabilis at Birmingham Town Hall (1840). But although by 1855 Hopkins could write that 'stops of this

kind are now made by nearly all the English organ-builders', no real technical details are known of these early stops. On the analogy of wood and brass wind-instrument playing in general, treble pipes in the reed ranks were also put on higher pressure in larger organs from the organ of St Denis onwards. This of itself was a major advance, as can be readily seen by comparing a Trumpet at St Sulpice with one at Haarlem. For centuries French builders had appreciated that reed trebles needed 'boosting' if the splendid bass was not to peter out above *g′* or so: hence one of the functions of the mounted Cornet in the 18th century. Cavaillé-Coll's overblowing double-length flue and reed pipes were thus new not in principle but in character. A Flûte harmonique or Trompette harmonique is so made for bigger, rounder tone and, unlike the narrow-scaled overblowing flutes of the 17th century, always requires strong, copious wind. The formation of nodes in overblowing flue pipes is helped by a small hole piercing the pipe rather less than halfway along from the mouth, the exact position affecting the overtone content of the pipe. In reeds, the hole is not necessary. The tone of neither flue nor reed harmonic pipes blends idiomatically with the Principal chorus; 17th-century builders therefore reserved such flutes for solo colour. Reed and flue harmonic stops show the desire felt in the 1840s for smooth reeds that stay in tune, and precisely voiced flue stops with no initial 'chiff' (a puff of wind articulating the start of each note) or articulation. Full- or double-length resonators gave smoothness to the reeds, while in flue pipes the chiff was eliminated by a heavier nicking of the languid, by 'ears and beard' (see §III, 1, above) and by roller-beards (dowels, circular in section, placed between the ears near the windway), all aiding prompt, smooth speech.

Further technical advances made between 1825 and 1845 concern the action. Many 19th-century builders were ingenious with purely mechanical devices for such accessories as double Venetian swells (H. Willis, Gloucester Cathedral, 1847), stop-combinations (Ladegast, Sauer, Roosevelt), crescendo pedals (Haas) and various couplers. Improved bellows-with-reservoir, greater application of two or even more wind pressures in an organ, improved slider-chests (and eventually cone-chests) were all at the skilled builder's disposal by 1845. So was the 'Barker lever' or mechanical-pneumatic action (see fig.8). By 1833, Booth in England and Hamilton in Scotland had constructed such actions. C.S. Barker worked on power pneumatics and compressed air, offering an apparatus to York Minster (1833), Birmingham Town Hall (1834–5) and, in France, to Cavaillé-Coll (1837). The pneumatic principle could also be applied to sliders and to such accessories as 'thumb-pistons' (H. Willis, 1851). Barker's French patent was taken out in 1839, and he applied his action to the organ under construction at St Denis by Cavaillé-Coll, whose high-pressure stops were indeed said to have been unplayable without this key-action. It was probably also in France that the first fully pneumatic action was made, in which all the tracker's backfalls, squares, rollers etc. were replaced by one pneumatic tube from key to pallet. The system is accredited to P.-A. Moitessier (1845), and was later modified with a partly mechanical action (Fermis, 1866) and adopted by such major builders as Willis (the divided organ at St Paul's Cathedral, 1872). Although Walcker applied this so-called tubular-pneumatic action to his cone-chests in 1889, the action gained only a minor success outside England (and, to some extent, the USA) because the action was sluggish when the keys were too far removed from the chests, although it was used extensively in Australia and New Zealand until well into the 20th century. As for the chests themselves, English, American and French builders preferred improved slider-chests to barless chests, often modifying the larger pallets with a secondary mechanism allowing them to be opened without undue key-pressure (Willis patent dated 1861, etc.). Audsley was witness to much American activity in designing 'pneumatic chests' in the late 19th century. Around the turn of the century, American builders such as Estey developed a reliable tubular-pneumatic action using ventil-chests, which they employed quite extensively, as did Möller and some of the Midwestern builders, and Steere obtained the rights to the system developed by the German builder Weigle. But other builders, such as Hook & Hastings, Hutchings and, in Canada, Casavant, went almost directly from Barker-machine mechanical to electro-pneumatic actions.

Electric actions were devised during the same period in England (Wilkinson 1826, Gauntlett 1852, Goundry 1863) and France (Du Moncel, Barker, Stein & fils), but these early experiments were incapable of reliable practical application. Electro-pneumatic action (see fig.11) overcomes the difficulty of directly opening a pallet by electro-magnets in that the magnet opens instead the smaller valve of a pneumatic motor which then opens the pallet. One such system is usually accredited to Albert Peschard (*c*1860); as a result of his work Barker took out a patent in 1868, and in turn licensed Bryceson to build such an action in the Theatre Royal, Drury Lane (1868). According to Hopkins, an electrification for the organ at Gloucester Cathedral for the Three Choirs Festival of 1868 allowed the keyboards to be placed nearer the conductor, far from the pipes, an obvious and updated version of the 'long movements' of the tracker-action organ used in the 1784 Commemoration of Handel in Westminster Abbey. A decade or more before the end of the century Walcker in Germany, Merklin in France, Roosevelt in the USA, Casavant in Canada and Willis in England were all producing reliable electric actions which allowed them to build detached consoles some way away from the organs high up at the west end or in a triforium gallery of the quire. The stop mechanism could also be operated electrically (Bryceson patent, 1868). Particularly in the USA, many electric actions and individual pipe-valve chests ('barless' chests) were patented and improved during the 1890s, becoming a norm shortly after 1900, some 25 years before the Willis firm, for example, turned exclusively to electro-pneumatic action. During the first half of the 20th century, most important organ builders throughout the world devised one or other type of electro-pneumatic action (see Whitworth, B1930). Clearly electric systems could serve accessories such as stop-combinations (whereby a button or switch of some kind could bring on pre-selected stops), or Swell pedals operating shutters around part or all of the pipework. Much of the ingenuity exercised on such accessories belongs to the early 20th century rather than the 19th.

3. Some influential organs. Reference has already been made to Walcker's organ for the Paulskirche, Frankfurt, and Schulze's for Halberstadt Cathedral.

Walcker's habitual scheme was close to such later 18th-century organs as that at the Michaeliskirche, Hamburg, with a large, heavy Great organ (often 32′) and a Pedal booming and powerful yet removed from true chorus purposes. Other German firms such as Schulze and Ladegast seem often to have made a brighter sound, with large-scale Mixtures and a tonal chorus brash yet recognizably in a tradition. Schulze's influence in England was considerable as his large, full-sounding Diapasons caught the taste of the time and influenced the work of builders such as Lewis for some decades after the Great Exhibition of 1851. Even his little colour stop, the narrow-scaled Lieblich Gedackt, became standard in English organs for the next 100 years. Such builders had a high standard of workmanship and the mass of 'good solid pipework' of foundational pitches in an influential organ like Sauer's for the Thomaskirche, Leipzig, was seen as a great advance on earlier organs with their greater percentage of higher-pitched stops. The craftsmanship and materials in a major Cavaillé-Coll organ are immensely impressive, as are the spaciousness (allowing pipes 'room to speak') and complicated actions and the careful planning of several chest levels. The drawings of the various elevations, tiers and cross-sections of the St Sulpice organ, for example, are witness to one of the great engineering masterpieces of the 19th century.

The St Denis organ has a well-known position in organ history, and its restoration in 1987–8 enabled players and builders to evaluate it for the youthful masterpiece that it is. The casework had already been designed when several builders tendered for the work, and Cavaillé-Coll's two plans of 1833 and 1841 show the great changes in organ building during that crucial decade. Flutes and mutations were reduced, overblowing stops were introduced, string stops added harmonic complexity, Barker's action allowed new arrangements of the chests, and the wind supply was increased and improved. Despite its ancestry in Bédos de Celles' scheme for a large 32′ organ, the instrument at St Denis (Table 28) was a great step along the 19th-century path. The Bombarde and Pedal departments became an ideal for hundreds of French or French-inspired organs over the next century or so; the scaling throughout became wider than classical French, and the voicing, as well as the wind pressure, stronger. It is not always clear how Cavaillé-Coll intended his organs to be registered, but since such stops as the Flûte harmonique are simply new versions of the auxiliary 8′ ranks drawn in old *fonds d'orgue* combinations, it is likely that he expected them to be used in choruses as well as solos (an interesting characteristic of the Flûte harmonique is that the upper range has a stronger, smoother character than the lower octaves, and one can play both solo and accompaniment on the same stop). Much the same could be said for the string stops (with tuning-slots at the top of the pipe) and the thick, stopped Bourdons. Nicking of languids was generally severe, at least in later organs of this builder; this, added to the slots cut into even the smallest Mixture pipes, aided smooth, constant tone. Conical and narrow-scaled stopped pipes were not conspicuous, and Cavaillé-Coll's spectrum of pipe forms was not particularly great. The foundation stops (*jeux de fonds*) of one manual were placed on one wind-chest, the reeds and (sometimes) flute mutations (*jeux de combinaison*) were placed on another. Each chest could have its own wind pressure and each could be controlled by a

Stops marked * are double-length harmonic stops

valve ('ventil') that admitted wind only when required, thus allowing a registration to be prepared in advance, but not brought on until needed. The *Grand orgue* was never underbuilt in relation to the Swell, as it often was in England, nor did the reeds lose their brilliance. Feeder and reservoir bellows were generous, and the pneumatic action somewhat cumbersome in the space it took. As with Schulze organs, soundboards were ample in size for the boldly treated pipework. But neither electric actions nor general crescendo gadgets were found on Cavaillé-Coll's organs; indeed, he is recorded as saying that he could see no advantage in the use of electricity. (His showroom is illustrated in CAVAILLÉ-COLL, ARISTIDE.)

In Italy, Serassi, like his French and English colleagues, 'extended' local traditions and made many quite large and impressive-sounding organs of a curious Venetian compromise. The main manual would control 20 or more stops, including 16′ or even 32′ Principale and flutes and Violas of 8′ and 4′; most chorus stops were divided; the highest ranks were collected into Mixtures; and solo and chorus reeds were strong in tone. One or two subsidiary

manuals, of six to ten halved stops often in a Swell box, provided echo effects but no true chorus. The compass was long (frequently from *C′*); the pedal organ had six to eight bass stops; and there were many accessories, both sounding (bells, thunder, drum) and mechanical (composition pedals, couplers, including octave and suboctave). Some flamboyant music was written for organs of this type, by V.A. Petrali, Giacomo Davide and others.

In Spain, organ building came to something of a standstill; with the exception of a two-rank Voz celeste, the stop-list of Pedro Roques's 1870 organ for Cadiz Cathedral could have been written a century or more earlier. The farther cities of eastern Europe were completely conquered by central German and Bohemian organ building, organ repertory and organ players by the 19th century. The outposts of German organ art in east Prussia and Silesia had long known large instruments (both Protestant and Roman Catholic) and the new techniques led to wide dissemination of ideas. Occasionally a builder would try something new, such as Buchholz's solo organ: 16.8.8.8.8.8.4, in the 'Black' Church (1839) at Kronstadt (now Braşov, Romania); but on the whole builders were more anxious to improve action, accessories, bellows and chests of the more conventional organs.

In many ways the country best able to develop its organ was England, where a new awareness of foreign designs and repertory coincided with favourable economic conditions and the growing popularity of organs in secular concert halls and large nonconformist churches. While much work remains to be done on the position of the organ in France and Italy during the period 1830–50, the general picture of the English organ is clear enough. During the 1820s, the Choir organ was superseded by the Swell as the major secondary division; pedals came to be regarded as normal (though at first only with a rank or two of large-scaled wooden pipes); the compass generally remained at *G′*; and organists did as well as they could with the newly favoured music of J.S. Bach – *Das wohltemperirte Clavier* being as much played as the true organ music. Much of the newness of the British organ before Henry Willis's influential instrument for the 1851 Exhibition has been accredited to the friendship between H.J. Gauntlett, the composer and organist, and William Hill, organ builder and former partner in the firm of Elliot. About 1833 Gauntlett visited Haarlem, apparently on the advice of Samuel Wesley, and there are various hints throughout Gauntlett's career as an adviser on organs that such instruments were in his mind. His personal library too shows him to have been a good example of the outward-looking early Victorian musician. Of the dozen or so organs built by Hill under Gauntlett's influence, the one at Great George Street Chapel, Liverpool (1841), was the most indicative of things to come. Like Hopkins, Gauntlett knew enough German organ music to see the *C* compass as most useful for manuals, while S.S. Wesley favoured *G′* compass even on the new Willis masterpiece of St George's Hall, Liverpool. Much the same reason lay behind Gauntlett's scheme for the pedal departments of larger organs, for example the one at Christ Church, Newgate Street, London (a 1690 Harris instrument extensively rebuilt by Hill 1827–38); such a scheme (Table 29) presupposed 'continental scaling' and not the large open-wood pedal scales described by Hopkins as more than twice too large.

Cavaillé-Coll visited Hill's workshops in 1844, as he did others at that period, and the influence they may have had on each other deserves closer study. The French, German and Italian stop names of many Hill-Gauntlett organs suggest at least paper knowledge of and interest in foreign organs; as late as 1871, Willis's new organ for the Royal Albert Hall can be related closely to Cavaillé-Coll's for St Sulpice. Hill's Liverpool organ was a compromise between traditional English and new continental styles, with a 16-stop Swell (including 16′ reed), a small Choir organ of flutes, a high-pressure Tuba played from the Swell, six couplers, five composition pedals, and a complete compass of *C–d′–f‴*. Hill also designed a new kind of pallet that slid open and admitted high-pressure wind without increasing the touch-resistance. Neither he nor Gauntlett felt obliged to give up the long-established tradition of combining many international features: their organ at St Olave, Southwark (1846), for instance, was almost Serassian in its big Great and its solo Swell. It was left to Willis's organ for St George's Hall, Liverpool (1855), to establish fully the 'first modern British organ' (Table 30), which remained an ideal throughout the British Empire at its apogee. Less opulent instruments by Willis and the builders he influenced would merely have had fewer choices of 8′ and 4′ colour. Large though such organs were, their priority was not necessarily traditional organ repertory; rather they encouraged even further the age-old regard for large organs *per se*, useful for transcriptions of orchestral and vocal music and impressive as engineering projects with such innovations as inclined stop-jambs, pneumatic thumb-pistons, concave and radiating pedal-board (perfected by Willis soon after 1851 but not adopted in America until the 1890s, and even later on the continent), Barker levers to each department, varied wind pressures, new wind-raising devices, pneumatic couplers and a Swell pedal. The Swell alone was a good example of the general attitude. Of the

Compass: *G′–a‴*; pedal *C–f′*
Ten couplers (including Suboctave Swell to Great, Superoctave Swell to Great)
42 pneumatic pistons
Two bellows blown by a steam engine (8 horsepower)
Wind pressure: from 90 mm to 510 mm
Pneumatic lever (doubled for pedals)

'double Venetian front' at Gloucester Cathedral (1847), Willis himself observed that 'the pianissimo was simply astounding' but gave no reason why he thought this a desirable aim.

The old-fashioned unequal temperament at Liverpool, applied on the advice of S.S. Wesley, was changed in 1867 (although the old G′ compass was not changed to C until 1898). The wind pressure of the solo reeds was raised to 48·5 cm in the bass and 62 cm in the treble. Along with greater power went the demand for apparatus to control it. In 1857 Willis had patented a crescendo pedal – a foot-lever rotating a cylinder that activated pneumatic motors at the ends of the sliders. There were many other such devices, including one by Walcker (copied briefly by Hook & Hastings), in which a horizontal sliding metal bar was substituted for the foot-lever. In later organs, Willis took his schemes to a logical end by ousting the Choir organ for a Solo organ in certain three-manual instruments (e.g. Sheldonian Theatre, Oxford, 1877); already at Gloucester (1847) the Swell had been made nearly three times as large as the Choir.

It is clear from the lists of specifications given by Hopkins and Rimbault, as it is in earlier lists by Seidel, Hamilton and others, that each major firm about 1850 had its hallmarks. Each introduced into many organs a characteristic stop (e.g. Hill's Octave Clarion 2′) or principle of construction or occasional foible (e.g. Cavaillé-Coll's Septième ranks); each had its own patented action, chest and wind-raising device; and each had a known attitude towards such major developments as harmonic reeds, either exploiting or rejecting them. Major German organs built about 1860 were in general either less inventive or more traditional than in England and France, and this difference was reflected in those organs of the USA and the British Empire that followed the foreign models favoured by their respective builders. St George's Hall, Liverpool, had the ideal town-hall organ, a far cry from such modest concert organs as Elliot's in the Hanover Square Rooms, London (1804, 12 stops). It was the secular organ (Exeter Hall, London, and Birmingham Town Hall, both 1849) that first saw the application of the pneumatic lever to key action and one of Hill's secular organs in London (the Panopticon, 1853) that first had pneumatically operated sliders, as well as higher pressure for treble pipes and a reversible crescendo pedal pushing out the organ stops one by one. The Solo organ or fourth manual, whether enclosed (Leeds, 1859) or not, also had its origins in the town-hall organ. The emphasis behind such contemporary designs as, say, Willis's organ for St Paul's Cathedral (1872) and Hill's for Melbourne Town Hall (1870) reflects their contrasting ecclesiastical and secular natures: one would expect the latter to have bigger Solo manuals, smaller Choir manuals, perhaps a bigger compass, and certainly a larger array of unusual tone-effects.

It was the crescendo and diminuendo of a British town-hall organ (Glasgow; T.C. Lewis, 1877) that led Hans von Bülow to write to the local newspaper and claim never to have 'met with an organ so good in Germany'. Indeed, by comparison the German organ may well have seemed a dreary instrument, with little ability to blend or offer the organist much delight in its tone, touch or expressive musical potential. It can hardly be assumed, however, that the tone of new German organs did not occasionally delight; organists may well have liked the

sounds produced by Schulze's highly differentiated voicing in a small two-manual like that at Etzelbach (1869). Such an organ (Table 31) was utterly typical in its day, although in some ways Schulze was old-fashioned (e.g. with his diagonal bellows at Doncaster, 1862).

Much German organ music of the late 19th century was written for a large, sombre-voiced instrument which depended for effect more on weight and dynamic extremes than on the sort of colour provided by, for instance, Cavaillé-Coll's Bombarde manual or Willis's Swell. Indeed, the very size and gravity of such instruments is their chief musical attribute, and Liszt, Reubke, Reger and others capitalized impressively on these qualities. Specifications were often much more classical in appearance than their voicing and general tone justify. Extremes of timbre in the form of harmonic reed choruses were not much favoured, and it is not always easy to see exactly why a German organ, even in its various neo-classical guises, needed a third or fourth manual. The large instrument in Magdeburg Cathedral (Table 32), built by the firm of Reubke, expresses the potential sought by such composers as its scion Julius Reubke (1834–58). Walcker's organ of 1886 for the Stephansdom, Vienna, was even less systematic, with an ordinary Pedal but a huge Great organ manual of 35 stops strewn over the west end, and two further manuals, yet only one stop was in a Swell box. Similarly, not until 1857 at Ulm did Walcker use the Barker lever and not until 1890 a fully pneumatic action. A lack of inventiveness was also evident in the stop-lists themselves: Sauer's two organs in Leipzig both with about 60 stops (the Peterskirche, 1885, and the Thomaskirche, 1889) had almost identical specifications, both full of heavy 8′ stops. Such were the instruments played by Reger and Straube, and for which registrations were fairly standardized. Thus 8′ ranks were mixed freely, according to choice, but a 4′ stop aided their blend, particularly a wide 4′ above a narrow 8′. An organ that cannot provide an accompaniment of Gedackt 8′ + Voix céleste 8′ + Spitzflöte 4′ voiced on late 19th-century principles cannot provide the sounds intended by Reger in his quieter movements.

For such music it is also vital to be able to change stops quickly. Accessories became a priority, and by 1900 a German organ of 12 speaking stops could have as many

as 12 'aids'. This was in addition to the Swell, which by then usually took the form of a cylinder rolled by the foot (*Walze*) and operating horizontal shutters. Other aids were the manual coupler, pedal coupler, octave and suboctave couplers, several pre-set combinations (labelled *p*, *mf*, *pp* etc.), one or more free combinations (set as required), General Crescendo (likewise operated by a foot cylinder or *Rollschweller*) and so on. But it is a mistake to assume that such composers as Reger necessarily required a General Crescendo or fixed combinations. The free combination, which requires good precision work on the builder's part, is more useful, whether mechanical or pneumatic. Similarly, the high-pressure reeds and large-mouth flues (called Seraphon) made by Weigle between 1890 and 1940 needed careful engineering, 'hard' though the tone undeniably sounded even at the time (as is shown by Schweitzer's opinion of the Stuttgart Liederhalle organ built in 1894–5).

Although the best of the 19th-century organs may now deserve the status of historical monuments, little musical sense can be made of such mature Romantic organs as Weigle's at Lauterbach (1906), whose stop-list is given in Table 33. Such organs were not so much 'Romantic' as perversions of a legitimate ideal current from Gabler to Walcker; it is hard to see them being fashionable again. Weigle's Stuttgart organ was criticized by Audsley (B1905) for making 'absolutely no attempt to place at the disposal of the *virtuoso* the ready means of producing complicated orchestral effects or of massing special tone-colours', which indeed was a high priority with performers of the day, who praised builders such as E.M. Skinner for providing such means.

As an example of a true Romantic organ close to the music of a lively, century-long tradition, Ladegast's organ for Merseburg Cathedral (completed 1855 in a classical case by Thayssner), for which Liszt wrote his Prelude and Fugue on B–A–C–H, would serve, although it is of interest that this large organ possesses no enclosed divisions, nor playing aids beyond a few couplers and *Sperrventile*; so would Cavaillé-Coll's for Ste Clotilde, Paris, where César Franck was organist from 1859 to 1890, and which he could yet describe as 'an orchestra':

Grand orgue	16.16.8.8.8.8.4.4.$2\frac{2}{3}$.2.V.16.8.4
Positif	16.8.8.8.8.8.4.4.$2\frac{2}{3}$.2.8.8.4
Récit	8.8.8.8.4.2.8.8.4
Pédale	32.16.8.4.16.16.8.4

The superiority of Cavaillé-Coll's voicing, particularly of the reeds, would have given Franck a more musical instrument than Weigle's at Lauterbach. The several 8′ stops are there for variety, and registrations still more or less followed traditional ideas of *plein jeu*, *grand jeu*, *fonds d'orgue* etc., for which the *pédales de combinaison* were essential. In general the principles behind the specification at Ste Clotilde were quite different from those of Weigle, and exercised a subtle influence on the repertory from Franck to Messiaen. French builders remained faithful to slider-chests in both practice and theory (cf J. Guédon: *Nouveau manuel*, 1903), and eschewed dull, foundational reed stops.

As an example of *fin de siècle* development beyond the demands of organ music, the Great organ manual of Walcker's Paulskirche organ, Frankfurt (1827), can be compared with its rebuild by the same firm 72 years later. The stop-list alone makes clear the change of taste and

From the mid-19th century organs in the USA broke from the older English pattern with increasing use of European innovations (often demanded by organists who had studied in Europe). Gambas and Harmonic Flutes (the latter usually at 4′ pitch) assumed a permanent place in the stop-lists of even small organs, and Solo divisions and high-pressure or harmonic-length reeds appeared in larger ones. The Barker machine was commonly used in large organs from about 1860 onwards, and early experiments (Roosevelt, 1869) were made with electric actions. Immigrant builders, mainly from Germany, began to do significant work in the Midwest (Pfeffer, Kilgen, Koehnken etc.) but appear not to have had significant influence on the large eastern builders. Little distinction was made between church and secular organs: Hook's large organs in Mechanics Hall, Worcester, Massachusetts (1864), and Immaculate Conception Church, Boston (1863), were very similar in size, stop-list and voicing, and were indeed expected to play much the same repertory, yet by the time Hook & Hastings's 70-stop organ was built for Boston's Holy Cross Cathedral in 1875, a distinct type of American Romantic organ had emerged, different in many respects from those of England and the Continent.

4. ELECTRICITY AND THE ORGAN. The instruments of Robert Hope-Jones and his lesser imitators are considered the most extreme of a highly experimental period, both tonally and mechanically. In the latter they broke new ground, but in tonal matters they extend the principles behind such organs as that at Lauterbach by omitting all ranks above a wide flute 2′, resulting in such schemes as the following for the Great organ manual at Worcester Cathedral (1896): 16.8.8.8.8.8.4.4.2.16.8 plus ten couplers to Great and seven composition keys. The tone was characterized by a corresponding smoothing out of

acoustic 'interest' and a princely indifference to traditional chorus-blending; yet the 1904 instrument at St John's, Newfoundland, was described in a contemporary account as having 'wonderfully powerful and delightfully neat tone'. Ignored by French and German organ historians, Hope-Jones built few instruments himself and had only limited business success in Britain and the USA; but his influence was significant in the early decades of the 20th century.

During the 25 years from 1889 to 1914 Hope-Jones contributed two major innovations: to key-action (electric, with stop-switches for registration, 'double touch' for keys and accessories), and to pipework and specification (large harmonic Trombas, very narrow Trumpets, heavy-pressure Diapasons with 'leathered' lips – i.e. with thin leather glued round the edge of the lip to reduce brightness, very narrow and keen-sounding string stops and wide-scaled open flutes). His diaphone pipe of 1893 was itself a new departure (see fig.21). Though no doubt more effective as a foghorn (an earlier version was accepted as such by the Canadian government, and diaphones were used as lighthouse fog-signals as late as the 1960s by the US Coast Guard), the diaphone is a good guide to the tone required by some musicians about 1900. Hope-Jones's actions were too finely designed for organs (they were more effective in telephone exchanges), but the period was one of experiment in electrical technology and his contributions are important. So many devices or facilities, such as those enabling the organist to 'prepare' stops which remained silent until required, or to open Swell shutters one by one, were made much easier with electricity; so was 'borrowing' stops, still disapproved of by Audsley (B1905) but in principle leading to 'unit-chests', 'extension organs' and other systems using one rank of pipes for several purposes. Hope-Jones thus typifies a movement that led to such extraordinary achievements for their time as the stadium organ in Chicago (Barton, 1929) where 44 ranks of pipes and various percussion effects produced an organ of six manuals (hanging in lofts above an auditorium of 25,000 seats) controlled by a movable console of 884 stop-controls and accessories, and blown by pressures of 40 to 140 cm, the latter for the diaphones. The extension organ of 1938 in the Civic Hall, Wolverhampton, was more modest and typical (Table 34).

Electricity has been used to replace key-pallet action (see fig.11), operate stop-mechanisms and accessories (couplers, combinations, tremulant, Swell shutters etc.), drive a motor for raising the wind and replace older chest types. The design of such mechanisms requires great skill and was perfected only during the 20th century. Certain sophisticated gadgets like Willis's 'infinite speed and gradation Swell' (where the amount by which the pedal is pushed forward is a measure of the speed at which the shutters open) date from the 1930s. In 1905 Audsley was still justifying the 'incomplete' nature of his discussion of electro-pneumatic actions by 'the tentative state of that branch of organ construction at this time'. By then, however, knowledge of such actions was advanced enough for E.M. Skinner's system to be applied at St Bartholomew, New York, to a console playing two organs, one at each end of the church. Skinner was perhaps America's most innovatory designer of actions; his 'pitman chest' (see below), still widely used in the USA, was first developed during his employment with Hutchings in the 1890s and

Electronic section for Solo Organ (flute and reed effects, chimes)

was a radical departure from other systems then in use which were, with the exception of Austin's equally original 'Universal Air Chest', largely electrified adaptations of the older slider-, ventil-, or cone-chests.

Perhaps the most radical application of electricity to organ building was that enabling any key to be connected to any pipe: as in other forms of individual note-valve chests, each pipe stands over its own individual valve on the so-called unit-chest, but through the use of switching mechanisms such unit-chests can be used for one or more stops of an organ. A 2′ pipe could be *c*′ of a nominal 8′ stop, *c* of a 4′ stop, *F* of a $2\frac{2}{3}$′ stop, etc., and the row of

pipes 'extended' to allow complete compass at all levels. The principle of 'extension' was known to Praetorius for a little table positive, and Marcussen applied it to six of his *Hauptwerk* stops at Siseby in 1819; an 'extension organ' is merely one taking the idea of such 'duplexed ranks' to a logical conclusion. Electric actions made such systems much easier to use. That the idea is basically inimical to true organ tone, since no consistently scaled rank will serve two purposes, did not escape the attention of the better builders. At Wolverhampton, for example, the principle is applied very discreetly, and builders such as Skinner and Austin avoided it almost entirely except in the Pedal department. But extended ranks cannot provide as much power and variety as their stop-knobs promise, and some builders compensated by coarsening the tonal quality of the pipes concerned: the pressure was raised, languids sharp-angled, upper lips leathered, scaling enlarged or narrowed excessively, perhaps with a double languid (drawing in air from outside) or double mouth (two sides of a square pipe provided with a mouth, as in the Doppelflöte of the late 18th century and the 19th), reed-tongues 'weighted' to encourage stronger foundational tone, cheaper metal used, and sometimes (in the pedals) a diaphone resorted to. Many of the orchestral colours imitated by builders and recommended by influential writers were themselves ephemeral (e.g. the euphonium). New chests, particularly the Anglo-American pitman chest (E.M. Skinner), were devised in which the key and drawstop had equal access to the valve below the pipe, sounding it only when both were activated – a rather ingenious and efficient system that has stood the test of time.

Builders of the period 1840–1940 often disagreed with one another's taste in details. Hope-Jones's diaphones were not made (or were only briefly employed) by most builders, nor Cavaillé-Coll's type of slotted reed pipes outside France, nor English leathered Diapasons beyond a certain period in England and the USA, nor the unit-chest by most of the better builders of church organs. The origin of many voicing techniques, such as leathering the lips of flue pipes and weighting reed-tongues with brass or lead, is obscure; so many had their origins in earlier periods that only the extremes of various kinds (high pressure, diaphone pipes, electro-pneumatic action etc.) can be dated from the late 19th century. It was these extremes that led to the CINEMA ORGAN about 1911. A large-looking Wurlitzer organ of this period contained only a few ranks of pipes voiced to either extreme and 'extended' to provide many stops available at every pitch on every manual: a *reductio ad absurdum* of the principle of 'floating' chests. With its percussion traps and effects and omnipresent tremulants, its high-pressure pipework enclosed in grille-fronted chambers, its movable console operating electric actions and swell shutters, the cinema organ can be seen not only following on from the 'serious' organs of Hope-Jones, Compton, Pendlebury, Franklin Lloyd and others, but as an updated version of Vogler's orchestrion. Again it was not the church organ but the secular that demonstrated an idea taken to its logical end.

5. THE ORGAN IN THE EARLY 20TH CENTURY. The early decades of the 20th century saw more than one short-lived phenomenon. The heyday of the cinema organ lasted only until the introduction of soundtracks to moving pictures around 1930 (and a little later in Britain). Many such organs were ultimately removed from cinemas, some destroyed, and others moved to churches (where they were eventually found to be so inappropriate that they were replaced); but in the second half of the century some that survived *in situ* were restored, and, in America, others have been rebuilt and installed in 'pizza and beer' restaurants, where they continue their intended mission of providing entertainment. Another such development was the domestic self-playing organ (*see* PLAYER ORGAN), created by manufacturers such as Welte & Söhn of Freiburg and the Aeolian Company of New York, who each adapted their already successful electro-pneumatic roll-playing mechanisms for the REPRODUCING PIANO to the pipe organ. As seen from surviving player-roll libraries, the greater part of the repertory of these instruments consisted of orchestral and operatic transcriptions, and their tonal resources were geared to this music. However, legitimate organ music was also recorded, and some of these rolls now have considerable historical interest in that they preserve the performances of some notable turn-of-the-century organ virtuosos. The player organ enjoyed a worldwide market until a combination of the Depression and new fashions such as the radio and the gramophone set it into a near terminal decline in the 1930s.

The 'post-Romantic' organ of the early 20th century has been criticized on numerous counts, most of them to a greater or lesser extent legitimate. At its most mediocre, it was the 'factory organ' that roused the ire of Albert Schweitzer (B1906; see §VII, 1, below); it was also this organ that, sinking ever deeper into its makers' and players' preoccupations with the imitation of orchestral sounds, vast ranges of dynamic expression, and ingenious console gadgetry, threatened for a time to make a large part of the corpus of organ literature from Scheidt to Franck either obsolete or unintelligible. What is perhaps surprising is that at no other time in history has the organ been so ubiquitous: organs of all sizes were to be found not only in churches, chapels, cathedrals and concert halls, but also in auditoriums, cinemas, residences, hospitals, museums, hotels, spas, restaurants, ballrooms, skating-rinks, department stores and schools of all kinds. According to statistics from the US Census Bureau, more organs were built in that country in 1927 than in any year before or since. Eight years later, this figure had dropped to its lowest point before World War II (which interrupted organ building everywhere). The pattern was similar in Europe.

At its worst, the organ of this period was dull and uninspired, most of the small to medium-size instruments being virtually mass-produced and only shop-voiced. The use of extension and unification principles was rampant, resulting in a thinness and blandness of sound in the majority of smaller church organs. Some unfortunate architectural trends were also promulgated in this period. Since electric action removed all limitations from the placement of the console and the layout of the pipes, more and more organs were divided and placed in sound-smothering chambers that were often deep and without adequate openings, and the consoles (as well as Echo divisions with little historical connection) could be located almost anywhere, even at the opposite end of the church from the pipes. What such placements of organs may have gained in visual and physical convenience, they suffered from in musical inconvenience, and, once established, this fashion – perhaps most greatly abused in English-speaking countries – has been unfortunately difficult to reverse.

At its best, however, the early 20th-century organ was a triumph of technology and the possessor of sometimes surprisingly impressive musical qualities when allowed to do what it was designed for. A virtuoso cinema organist playing a good Wurlitzer, Barton or Compton can bring life and drama to a silent film; a suavely voiced Aeolian or Welte playing from a well-made orchestral roll can delight all but the most hardened purist. Similarly, in some of the larger 'symphonic' instruments, most often located in secular concert halls, one can discern the qualities that attracted such extraordinarily gifted and internationally recognized recitalists as Eddy, Guilmant, Courboin, Lemare, Cunningham and Farnam. Marcel Dupré was inspired to compose his monumental *Symphonie-Passion* (1924) while improvising on the monster organ in Philadelphia's Wanamaker store in 1921, later stating that he 'played in a state of exaltation that [he had] seldom known'. Such builders as Skinner, Kimball, Casavant, Willis, Harrison, Mutin or Steinmeyer could produce large instruments which could not only flood with sound a large building – whether a reverberant European cathedral or a dry American concert hall – but also perform transcriptions to perfection and do some justice to much of the legitimate organ literature, as well as serve as a foil to an orchestra or an accompaniment to a choir. When certain conservative and knowledgeable advisers (George Dixon in England, Emerson Richards in the USA, etc.) were involved, the stop-lists, at least on paper, could appear quite balanced. What were lacking were smaller instruments well enough designed and voiced to live up to the expectations generated by the large organs, and this lack may have been one of the many factors which helped to give impetus to the forthcoming Organ Reform movement.

VII. The Organ Revival, 1930–70

'Organ Revival' is a term used increasingly often as an English equivalent to *Orgelbewegung* (coined about 1930 as a simplified form of Gurlitt's *Orgel-Erneuerungsbewegung* proposed at the Freiburg congress, B1926). The movement was concerned with 'reviving' some of the 'historic principles' of the organ, because it was thought in German musicological circles of the 1920s that the 'true purpose and nature' of the organ had 'declined' and required 'regeneration'. Although such words were much used in Germany, considerable activity also occurred in other countries, notably the Netherlands, Denmark and Switzerland.

During the 1920s, not least in the light of current political movements, many aspects of German cultural life were re-examined, and before 1933 there were more or less formulated movements in folk music, youth music, church music, and the music of particular composers (e.g. the *Schützbewegung*). These movements had certain aims or assumptions in common, for their followers:

(i) reacted negatively to a previous period. In the *Orgelbewegung* this was done in the form of a protest against the thick, loud sonorities of the orchestral organ, the factory organ, the 'expressive' or symphonic organ, the organ as an engineered machine rather than an apparatus or 'tool of music'. As such, reacting against late 19th-century organ ideals is equivalent to reacting against late 19th-century music, and insufficient explanation has been given for why an organ of Sauer is less worthy of revival than, say, Wagner's *Parsifal*.

(ii) assumed that criteria could be determined. In 1906 Schweitzer's test for an organ, 'the best and sole' standard, was its fitness for playing J.S. Bach's music. Unfortunately, that ideal in the 1820s had already deflected the French and English organs from the better features of their native paths; and it is not *per se* a reliable criterion, since not only do opinions differ as to the 'nature of Bach's organ' but the composer himself played organs of quite opposing aims. To the reformers, the 'Bach organ' was more a generic term, merely signifying instruments built and voiced 'in the Baroque manner'. Schweitzer's rallying-cry was perhaps not to be taken too literally, although several builders in Alsace and south Germany met under its banner and adopted stop-lists (if nothing else) conducive to Bach registration. The resulting 'Alsatian Organ Reform' has been seen as the precursor of the Organ Revival.

(iii) attempted in general to lead to standardization. Schweitzer's views expressed at the Vienna Congress of the IMS in 1909 and at the Third Organ Conference at Freiberg, Lower Saxony in 1927 aimed at a general return to old ideals. Although in 1909 it may have been reasonable to equate *tonschön* with *alt*, a blanket equation of the two leads to over-uniformity and a kind of lazy norm often to be heard as simple anonymity in the tone of hundreds of neo-Baroque organs built in Germany and elsewhere since the mid-1930s.

1. Early indications. Schweitzer's book *J.S. Bach, le musicien-poète* (1905) and his pamphlet *Deutsche und französische Orgelbaukunst* (B1906) were highly formative, and still influential in some quarters at the end of the 20th century. A precursor in the workings of the Alsatian Organ Reform has been seen in Emil Rupp, for whom Walcker built a 'reformed organ' at St Paul, Strasbourg, in 1907. But equally indicative of the inevitable change in direction were works of more general musical scholarship. For example, Guilmant's series of old French organ music (begun in 1901 under the title Archives des Maîtres de l'Orgue) was much in advance of Karl Straube's 'editions' of old German composers (1904) with their anachronistic expression marks and improbable registrations. Also important was the pioneering work in the interpretation of old music published by Arnold Dolmetsch and others. Dolmetsch no doubt owed much to a favourable musical climate in England where Charles Salaman, Carl Engel and A.J. Hipkins had already reintroduced the harpsichord to public music-making. But, as in France and Germany, renewed interest in harpsichords did not necessarily lead to enlightenment with regard to organs. Nevertheless what Dolmetsch wrote in 1915 reflected his views over the past decades and summed up the situation admirably for anyone wishing to heed them:

> Church organs had that power based on sweetness which constitutes majesty. The change came on, and for the sake of louder tone, pressure of wind was doubled and trebled. The same pressure acting on the valves which let the wind into the pipes made them too heavy for the fingers to move through the keys. A machine was then invented which did the work at second hand [and] the music of the organ dragged on after the player's fingers as best it could. Personal touch, which did so much for phrasing and expression, was destroyed.
>
> Then fashion decreed that the organ should be an imitation of the orchestra. ... The organist, if he is clever, can give a chromo-lithograph of the *Meistersinger* Prelude; but he has not the right tone with which to play a chorale, if his organ is up-to-date. Modern compositions are intended for this machine, and all is well with them; but it is a revelation to hear Handel's or Bach's music on a well-preserved old organ.

There is nothing here about 'the Baroque organ', and the word was only later taken over from art historians to evoke an organ type more imaginary than real.

In England practice did not reflect enlightened theory. The ideas of organ advisers like Thomas Casson (1842–1910) and, during a particularly critical period, George Dixon (1870–1950) kept early 20th-century organs from

the worst excesses; but they were still only insular compromises. As with so many English writers of the period 1875–1975, their emphasis on stop-lists and imaginary 'ideal organs' was not basic enough to lead to radical rethinking. Factions in organ building are common, and in France the polarization of conservative 'Romanticists' versus German-influenced 'Reformers' meant that a modern organ could have one of two totally opposed characters depending on what the builder and his adviser favoured. But in England, many organists had only a compromise instrument of mixed lineage going back to William Hill and taking in a few non-establishment influences from Hope-Jones on one hand and later continental 'reform' builders such as D.A. Flentrop on the other. *Grove5* ('Organ') gives the specifications of several such organs, often built well and at great expense. Until the 1930s the situation in the USA was much the same as in England, although Willis's influence on Ernest Skinner prompted him to reintroduce the Great principal chorus in some of his organs in the 1920s. The increasing interest in Bach's music (as shown in the popularity of W. Lynnwood Farnam's recitals of the complete organ works of Bach in 1929) was an early sign of coming change.

2. German developments in the 1920s. A practical step was taken in 1921 when Oscar Walcker, with the collaboration of Wilibald Gurlitt, designed and built the Freiburg Praetorius-Orgel, inaugrated by Karl Straube. This was the first attempt at reconstructing the tonal character of a so-called Baroque organ according to some of the details given by Praetorius in *De organographia* (*Syntagma musicum*, ii).

Compromises were evident: suitable casework was not made, the stop-list was modified, the pipes were placed not on a slider-chest but a 'stop-channel chest', wind was supplied by an electric blower and the action was electro-pneumatic. Nonetheless, the organ was significant, not least in the publicity it gained during the organ conference held at Freiburg in 1926 before 600 members. The instrument was destroyed in 1944, and a second, less compromising one was made in 1954–5. The change in approach indicates clearly how German organ thinking had developed over 30 or so years: Gurlitt was still the adviser, but the organ was built by Walcker-Mayer with the collaboration of acoustic and technical experts (Lottermoser, E.K. Rössler) and closely modelled on the first specification in Praetorius's *De organographia*, with data taken from extant pipework by Praetorius's friend Esaias Compenius, and with mean-tone tuning, a slider-chest, mechanical action and a thorough *Werkprinzip* structure; the stop-lists is given in Table 35. Were a third 'Praetorius' organ to be built, one could expect that all compromises away from his specification would be dropped and an early 17th-century casework and wind system incorporated, being integral parts of the total sound-production.

Although both Schweitzer's and Gurlitt's views were directed towards certain music – that of J.S. Bach on the one hand and that of Scheidt and Schütz on the other – results were seen only gradually in organ building. After Rupp and Walcker visited Mutin, Cavaillé-Coll's successor, one or two organs were built with the express purpose of combining the musical potential of the German and French organ. One such instrument was at the Reinoldikirche, Dortmund, inaugrated in 1909 by Schweitzer and attracting the attention of Reger, for whom a festival was

held at Dortmund in 1910. The dual polyphonic-homophonic nature of Reger's mature style would in theory gain much from the character of an Alsatian Reform organ. The type of eclecticism aimed at in such organs was considerably ahead of its time and not fully understood; but it led to giant organs such as that at Passau Cathedral (Steinmeyer, 1930; 208 stops) in which one section serves as a 'German Romantic organ', another has a 'French character' (reeds, Cornet), and yet another provides a 'Baroque department'. While in north Germany such firms as Ott and Kemper remained closer to a single orderly tradition, the influence of Steinmeyer was wide, and a harbinger of things to come.

Yet returning to full *Werkprinzip* design was also only gradual. Like the 1921 Praetorius-Orgel, the influential organ of the Marienkirche, Göttingen (Furtwängler & Hammer, 1925), was a compromise with pneumatic action, but in its specification and scalings, prepared by Christhard Mahrenholz, it pointed the way to future development:

Less recognized is the broader Swiss approach, as expressed in Jacques Hanschin's paper in *Tagung für deutsche Orgelkunst: Freiburg, Lower Saxony, 1927*, and Kuhn's French-influenced *Rückpositiv* at Berne Minster (1930). The 'Hindemith organ' – that thought ideal for the performance of his sonatas – was itself a mean between extremes, and in fact revelatory of the real meaning of the movement to many, including 'neo-Baroque' composers such as Distler and Pepping. But important work was begun on technical aspects of organ building, and a climate of opinion was being created with regard to acoustics (*Akustische Zeitschrift*, 1936; *AMf*, 1939), slider-chest and their influence on tone (H.H. Jahnn: *Der Einfluss der Schleifenwindlade*, 1931), pallets (*ZI*, 1933), casework (W. Supper: *Architekt und Orgelbau*, 1934) and scaling (Mahrenholz, C1938). In Italy questions concerning old organs had been discussed for many years (e.g. *Musica sacra*, 1901–3), and even large electric organs like that in the Pontificio Istituto di Musica Sacra (Rome, 1933) had never shaken off certain traditional features. But in France technical achievement lagged behind

historical research: the documents and archives published by Raugel and Dufourcq led to the discovery of many old organs, as a result of which almost all were rebuilt over the next few decades, and many altered beyond recognition in an effort to make them suitable for German Baroque music.

3. Old organs. The position of surviving old organs in the Organ Reform was a difficult one. Important though the Schnitger organ in the Jacobikirche, Hamburg, or the Lübeck Totentanzorgel were to a writer like H.H. Jahnn (*Deutsche Musikgesellschaft: Kongress I: Leipzig 1925*), or the Silbermann in Freiberg, Lower Saxony, to E. Flade (*Tagung für deutsche Orgelkunst III: Freiberg, Lower Saxony, 1927*), in practice they were, obviously, not suitable for all the organ repertory. They would not allow, for instance, the gradual crescendo demanded by Reger and obtained on one manual by piling up three or four 8′ stops before the first 4′ was added. Oversimplified claims were often made – for instance, that ventil-chests are by nature 'bad'. It is probably true that, compass apart, an organ of 1700 is in certain respects more versatile than one of 1900; but no valid doctrine can be formed on the basis of such a generalization.

Nevertheless, the beauty of the Freiberg Cathedral Silbermann organ was not questioned, and the publication in facsimile of treatises by Werckmeister, Praetorius, Bédos de Celles, Mattheson, Adlung and Schlick heightened interest in the few extant remains of organs they described. One result, however, was that much-altered instruments were over-respected, and an organ like that at Amorbach (1774–82) or the Totentanzorgel gave, over the years, many misleading impressions, due, at least in part, to imperfect analysis. Enlightened opinion may no longer claim that 'it is the large Schnitger organ that best corresponds to the demands made by J.S. Bach's music' (Klotz, D(i)1934), but it is still almost impossible to be sure what kind of sound Schnitger was aiming at, since none of his instruments remain in wholly unaltered condition.

As examples of ill-conceived restorations, many organs in England, Ireland, France, Spain and Germany could be described, and as much damage was done during the 30 years following World War II as at any other period. The organ of Herzogenburg Abbey, Austria, can serve as an example. By 1964 most of its original character had either survived or was fairly easily ascertainable; but the 'restoration' of that year resulted in major changes based on unhistorical or oversimplified concepts. The main chests were enlarged to give a modern compass of *C*–*f*‴–*g*‴, thus discarding the original short octaves, the incomplete (but characteristic) pedals and most of the original chests; the action was discarded and newly made; manual and pedal Mixtures were changed in content; new ranks and stops of a kind unsuitable to an Austrian organ of 1749 were made; the instrument was revoiced throughout; and the original detached console was discarded and replaced by a new oak console. This organ would need a radical rebuild if it were ever again to give an organist anything like a true impression of the instruments known to Mozart.

By 1971, however, certain builders were attempting closer historical accuracy in their restorations, as is shown in a second Austrian organ, that of the Hofkirche, Innsbruck (see Table 8 and fig.34). Here the original wind-trunk was preserved, the wind pressure ascertained and voicing recovered; the original short *C*–*a*″ compass was restored (though the keys perhaps date from the 18th century); the original pitch level (*a*′ = 445), case, chests etc. were restored; and the instrument was tuned in an unequal temperament. Were the modern bellows to be replaced by one more characteristic of the period, the organ would represent better the late 20th-century ideals of restoration.

Almost wholly overlooked until the 1960s, however, were many noteworthy 19th-century organs in all countries. After World War II large numbers of these continued to be ruthlessly rebuilt or electrified, or, ironically, tonally ruined in misguided attempts to make them conform to neo-Baroque ideals.

4. Scandinavian and Dutch organs. A more radical rethinking of the organ appears to have been achieved in Scandinavia, but it is more likely that national organ types had been less extremely developed there during the crucial period 1870–1910. It is thus perhaps less a question of revival than of survival of old organ design. On the whole the Swedish organ had become more 'decadent' than the Danish, but interest in such things as mutations survived here and there. Naturally, German ventil-chests were found in Scandinavia, and Theodor Frobenius, a German-born builder who settled in Copenhagen, made the first Danish electric action. But the ideas aired by the Alsatian Organ Reform soon became respected in Denmark.

Simpler than the organ at the Marienkirche, Göttingen, yet put in a very imposing contemporary case by builders alert to correct acoustical placing, was the quire organ of the extraordinary Grundtvig Church, Copenhagen (1940), built by Marcussen. In 1920 the head of this firm was Sybrand Zachariassen, who was joined a little later by P.G. Andersen; by the late 1930s the firm was producing almost nothing but mechanical-action organs and doing good formative work in restoration (Sorø Cathedral, 1942). The Grundtvig Church organ was quite uneclectic (Table 36).

In the same year (1940) a *Rückpositiv* was added by Frobenius to the early 16th-century *Hauptwerk* from St Petri, Malmö, now in Malmö Museum, showing that builders were aware of the practical convenience of *Werkprinzip* elements. By 1944 the new organ of Jaegersborg, near Copenhagen, had three uncompromising *Werkprinzip* manuals complete with a Trumpet *en chamade*, so placed for power rather than for imitations of Spanish tone. (This has remained true of *Orgelbewegung* reeds *en chamade*.) Important too were the smaller organs made by the new builders after the war, especially in view of the lacklustre quality of most small organs built

in the pre-war period. Flentrop's eight-stop organ at Schoondijke (1951) was in its way even more influential than his *Werkprinzip* organ at Doetinchem (1952), which soon became a model for the design of *Hauptwerk* + *Rückpositiv* + Pedal towers. (The stop-lists of both are given in Table 37.) Open-toe voicing, mechanical action and encased departments were by now standard among the younger builders, although the importance of wind supply was still not understood. Such instruments went far beyond the theories of the *Orgelbewegung*, and it is a mistake to regard them as mere 17th- or 18th-century pastiche – they were in fact a new genre. Frequently they serve as practical demonstration of intricate theory and knowledge. Frobenius and Ingerslev's paper on end correction, for example (C1947), is the most important theoretical work by an organ builder in this field since Cavaillé-Coll.

5. The Organ Revival in the USA. The main innovators of the early revival in USA were Walter Holtkamp of Cleveland and G.D. Harrison, an Englishman working for the Skinner Organ Co. In 1933 Holtkamp had been contracted to add a *Rückpositiv* to Tthe large Romantic organ of the Cleveland Museum of Art, but the slider-chest had a multiple-valve system which was later abandoned in his work. Harrison's influence on tonal design was more important than the structural reforms; he had applied low pressure to a fairly large organ contracted for at Groton School in 1935, but structurally and mechanically it was otherwise no different from other electro-pneumatic organs built by the firm. This organ, like the slightly smaller but more coherent instrument built a year earlier for the Church of the Advent in Boston, was one of the first attempts in the USA at a large, classically influenced eclectic instrument, although its voicing hardly follows classical principles and its general effect lacks articulation. More successful, and certainly more influential, was the small, unencased, two-manual organ built in 1937 as an experiment, and installed in the Germanic (now Busch-Reisinger) Museum at Harvard University, which was heard by a vast audience through the broadcasts and recordings of E. Power Biggs, an early champion of the Reform movement. These and other isolated instruments of the period testify to a growing interest in historic European principles among some American organists and builders, Cavaillé-Coll and Silbermann being especially admired. Such organs, for all their drawbacks of voicing, pitman chests and electric action, possessed greater clarity than had been heard from American organs for some decades, and they made their point musically. Partly because of Holtkamp's efforts, many of these organs were free-standing rather than installed in the all-too-common chambers (fig.47), but the musical importance of casework was as yet unrealized, and only low wind pressures and gentle voicing curbed the tendency of 'pipes-in-the-open' to sound raw and unblending, especially in acoustically dry surroundings.

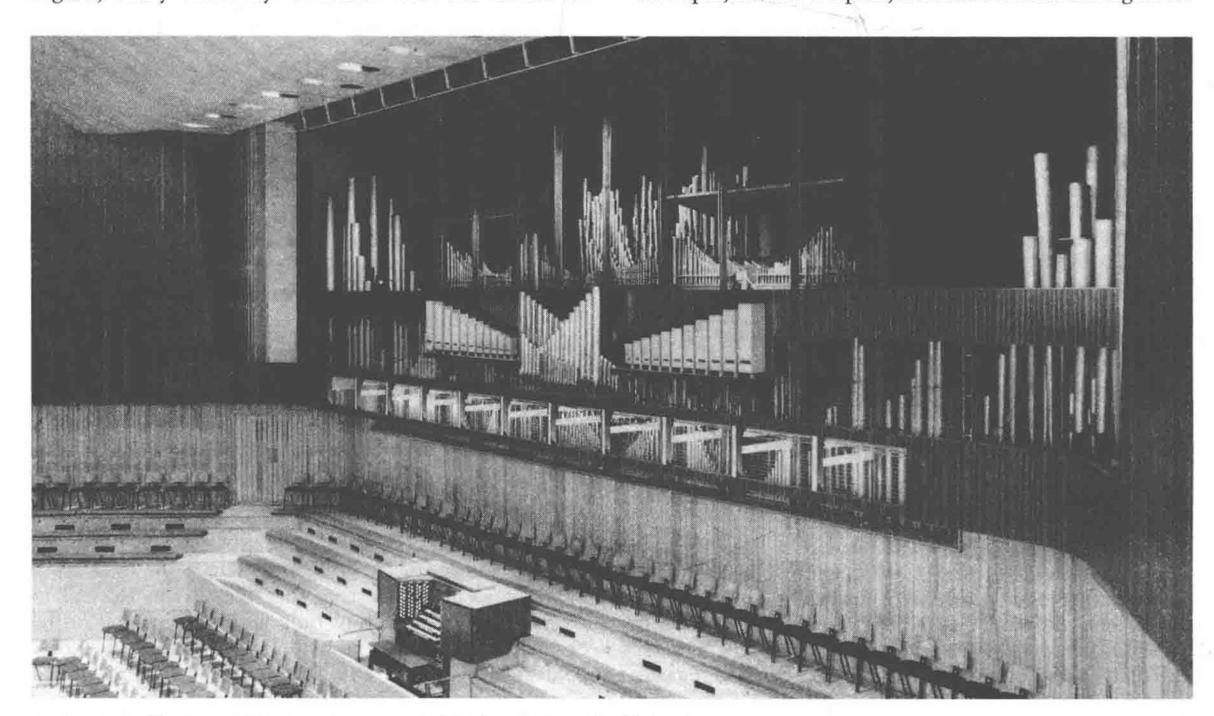
Soon after World War II the reform movement revived with renewed vigour. Academic and musicological writers leant heavily on 17th-century German literature and indeed tried to create a more rational (if sometimes contrived) language of organ terms (Bunjes, D(xv)1966). Organists and organ students, especially American, became much influenced by the various historic organs of France and Germany, although the relative inaccessibility of East German organs until the late 1980s, notably those of Silbermann, affected American-European organ design. European builders exported small but important organs to the USA (Rieger about 1952, Flentrop in 1954), and Beckerath consolidated the trend by building a 44-stop four-manual organ for Trinity Lutheran Church, Cleveland, in 1957. American firms were bound to be influenced by such instruments, and while Flentrop secured many prestigious American contracts (e.g. St Mark's Cathedral, Seattle), and Beckerath went on to build several equally important organs in Canada (e.g. St Joseph's Oratory, Montreal), other builders like Charles Fisk of Massachusetts and Casavant Frères of Quebec soon produced their own versions of the new styles. Casavant's organ of 1963 in Acadia University, Wolfville, Nova Scotia (Table 38) is

47. Organ by the Holtkamp Organ Co., inaugurated 1967, University of New Mexico, Albuquerque

a typical small organ of the kind inspired by such builders as Beckerath, and Fisk's organ in Mt Calvary Church, Baltimore, was influenced by Flentrop. From the point of view of the Organ Revival, such instruments were far in advance of the huge unencased organs made by the larger firms (e.g. Möller's paired organs in the Shrine of the Immaculate Conception, Washington DC, 1970), although it is fair to point out that inventive and contemporary visual effects can often be achieved by a good designer with unencased chests.

Many North American builders were willing to consult advisers who had practical or theoretical knowledge of historic organ types of Europe; at its best the collaboration is highly successful. Flentrop's organ of 1958 for the Busch-Reisinger Museum at Harvard reflects a further element: the strength of taste developed by players (in this instance E. Power Biggs) experienced in European organs. In North America, Flentrop, Metzler, Beckerath, Ahrend & Brunzema and others went on to build important instruments of great beauty, and from the late 1960s other influences became evident, such as the French elements in the stop-list and voicing at the Memorial Church, Harvard University (C.B. Fisk, 1967), or the pseudo-Italian elements in the large electric-action organ of the First Congregational Church, Los Angeles (Schlicker, 1969). It is true that neither instrument demonstrates a thorough understanding of its models, but such attempts were important stepping-stones towards stricter historical copies – a trend also followed by American harpsichord makers in the same period and one leading to less compromising organs (see §VIII below). The specific influence of the German-orientated *Orgelbewegung* has waned considerably in the USA and Canada since the 1970s; like the new organ terminology sometimes attempted, it was too artificial a graft to bear much fruit, and other, more attractive and more historically informed influences have taken its place in the thinking of builders and players.

6. ENGLAND, FRANCE AND ITALY. Although perceptive English organ enthusiasts such as Cecil Clutton were praising European 'reform' organs in print by around 1950, it seems to be true that the Organ Revival in England 'really took root only with the opening of the organ for the Royal Festival Hall, London, in 1954' (Clutton and Niland, D(xii)1963; fig.48). Despite careful planning by the adviser (Ralph Downes) and meticulous workmanship by the builders (Harrison & Harrison), the



composite nature of the organ made it little more than a quickly dated compromise. Its 103 stops give the impression of immense adaptability, and the German flutes, Anglo-German chorus and French reeds allow many types of organ music to be given reasonable performance; but the very size (quite apart from the semi-unencased construction and the electro-pneumatic action) make true sympathy with most musical styles impossible. Although admired by many players in both England and the USA, the instrument has had curiously few successors: new designs did not immediately appear, despite an awareness of continental organs (e.g. the Organ Club's visit to Frobenius in 1958) and the obvious qualities of tracker action (St Vedast-alias-Foster, London, built in 1961 by Noel Mander, using an 18th-century case and much antique pipework). J.W. Walker's organ of 1959 in the Italian Church, London, showed a rather confused scheme, but it helped to open the path to 'Baroque' influences:

Great organ	16.8.8.4.4.$2\frac{2}{3}$.2.II.IV.8
Choir organ	8.4.4.2.2.$1\frac{1}{3}$.II.III.8
Swell organ	8.8.8.8.4.4.$2\frac{2}{3}$.2.IV.16.8.8
Pedal	32.16.16.16.8.8.8.$5\frac{1}{3}$.4.4.IV.16.16.8.4

As in America, imported organs (e.g. The Queen's College, Oxford: Frobenius, 1965) played their part in promulgating the new tonal and mechanical ideals, which began to be taken up by such builders as Collins, Mander, and Grant, Degens & Bradbeer (New College, Oxford, 1969). Later in the 20th century some younger builders (e.g. Goetze & Gwynn, Drake and Collins) found inspiration closer to home, particularly in 18th-century English organs.

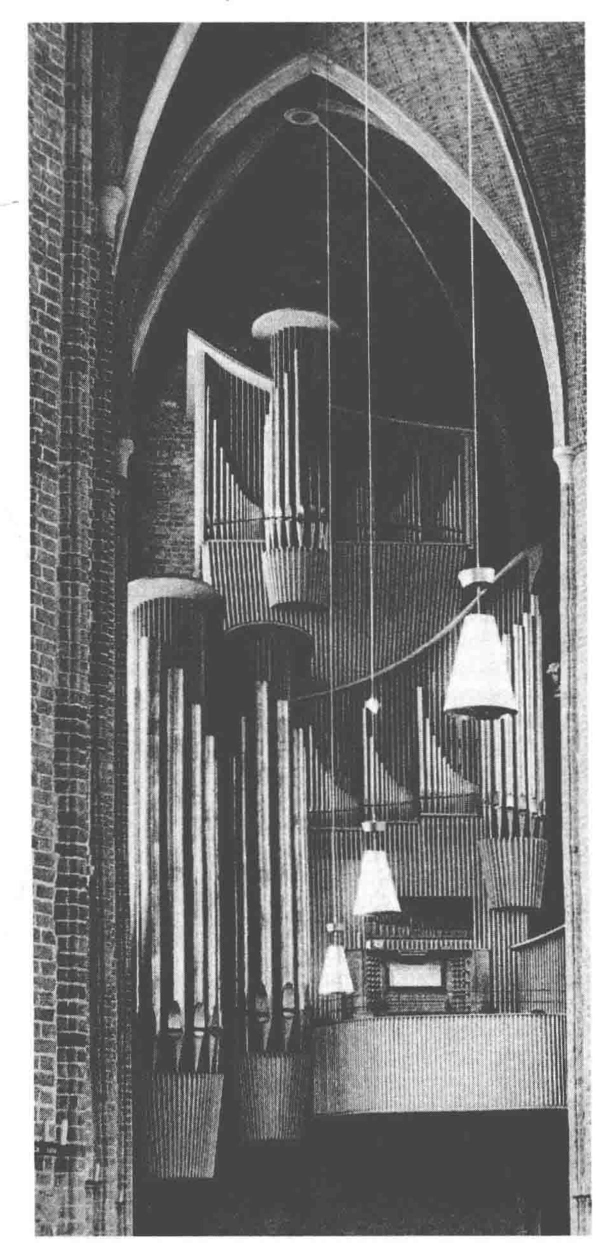
The French organ has developed on rather similar lines, 'neo-classical' indicating a frenchified composite organ designed with both Grigny and Bach, both Franck and Messiaen in mind. Most major French churches have such organs, many made by Gonzalez with the advice of Norbert Dufourcq, a collaboration which also unfortunately engineered the rebuilding of many intact classical and Romantic organs in a hybrid quasi-Germanic mould, with the stated aim of making them better fitted for the playing of Bach. Since the late 1960s closer imitations of old French styles have been attempted, for example the partial copy of a Bédos de Celles organ (complete with low pitch) by J.-G. Koenig at Sarre-Union (1968). In particular, the importance of the traditional French classical form of 'suspended' action has been recognized and such actions, notable for their sensitivity, have since successfully been made by American, Dutch and German builders as well as the French. In both England and France, 'restoration' of old organs had been, with a few significant exceptions (Poitiers Cathedral, restored by Boisseau), as detrimental as in Germany. The typically French classical 1693/1832 pedal department (Flutes 8′ and 4′ (*C–e*), Trompette 8′ and Clairon 4′ (*ravalement F′–e*)) at Auch Cathedral was altered in 1959 to a more 'correct' Reform stop-list (Principal 16′, Sub-Bass 16′, Bourdon 8′, Flûte 8′, Flûte 4′, Bombarde 16′, Trompette 8′, Clairon 4′). Only towards the end of the 20th century did builders in England or France show enlightened attitudes towards the subtler historical problems of pitch and voicing. In France the journal *Connaissance de l'orgue* has helped propagate sounder ideas, as have the British Institute of Organ Studies and the *Organ Yearbook* in England, and the Organ Historical Society in the USA.

In Italy the late 1960s witnessed a movement towards a kind of modified *Werkprinzip* organ but with characteristic Italian choruses and even at times Italian reeds. The organ at S Maria Assunta (B. Formentelli, 1967–8) has a *grand'organo* of 8.4.2.$1\frac{1}{3}$.1.$\frac{2}{3}$.$\frac{1}{2}$.$\frac{1}{3}$ + $\frac{1}{4}$.8.4.$2\frac{2}{3}$.2.$1\frac{3}{5}$.8.4, the last of them reeds. Large three-manual organs such as that at the Chiesa dei Servi, Bologna (Tamburini), united an Italian chorus, German mutations, Spanish Trumpet, Italian compass, mechanical action and general

48. Organ by Harrison & Harrison, inaugurated 1954, Royal Festival Hall, London

Werkprinzip relationships between the manuals. Other larger firms such as Ruffatti, on the other hand, seem to have been strongly affected by the 'American classic' movement, and, while they have produced some smaller mechanical-action organs, have concentrated more on large multi-purpose electric-action instruments, many of them built for export. Smaller organs too have attempted comprehensiveness; the instrument at S Severino, Bologna (G. Zanin & Figlio, 1968), has the following scheme:

Grand'organo	8.4.2.11.IV.8.2.II.8.8
Positivo	8.4.2.1⅓.1.8.2⅔.8
Pedale	16.8.8.4.16



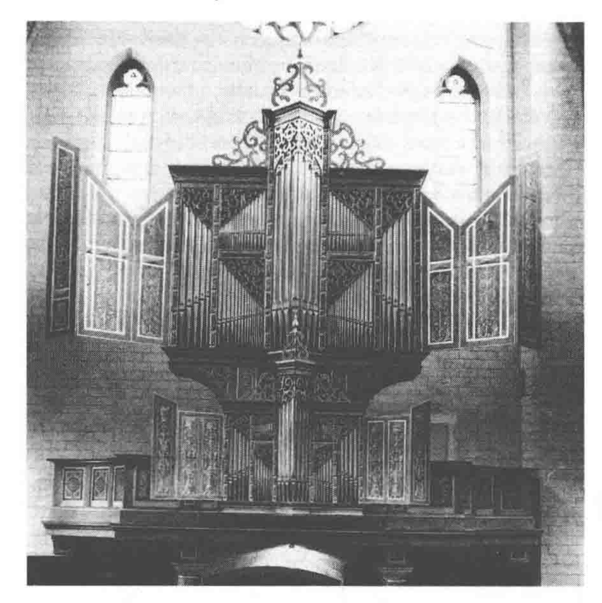
Apart from some restoration work by builders such as Amezua, and a few modern positive organs, the Iberian peninsula has been only slightly affected by the organ reform.

7. Some German developments since World War II. An important factor in postwar Germany was the prominence and high standard of many new and small firms, while the older and larger ones faded into the background. The appointment of organ advisers for each of the districts of Germany encouraged smaller builders as it also encouraged local variety and enterprise. From the early 1950s Beckerath of Hamburg and the two Schuke firms of Berlin (East and West) produced organs of strong character, often influenced by old instruments they had rebuilt (Schnitger organs rebuilt by Beckerath, Joachim Wagner organs by Alexander Schuke); as noted above, Beckerath also exported instruments to the USA and, in 1970, a smaller example to Britain (Clare College, Cambridge). Ahrend and his former partner Brunzema (pupils of Paul Ott) continued the trend towards strong-toned organs, omitting most mutations and relying on highly coloured flue and reed stops (usually made of hammered metal); old instruments restored by the firm (e.g. at Westerhusen) have a natural, unforced but startlingly powerful, breathy tone. The organ at Westerhusen, like Metzler's restoration at Nieuw Scheemda, Führer's at Hohenkirchen and Ahrend's in Stade, is a revelation of the musical colour open to a 17th-century organist of Friesland and Groningen, and these instruments have exercised an increasingly positive influence on the work of other north German builders as well as Americans such as John Brombaugh, Taylor & Boody and P.B. Fritts. The stop-lists seem nondescript; an example by Ahrend & Brunzema (Bremen-Oberneuland, 1966) is:

Hauptwerk	16.8.8.4.4.2.Mixtur.8
Rückpositiv	8.4.4.2.1⅓.II.Scharf.8
Pedal	16.8.4.16.8.2

But the sound is far from nondescript, and the idiosyncratic tone of such instruments is well removed from the top-heavy neo-Baroque anonymity typical of so many organs of the 1950s.

Before 1973 German builders rarely developed good designs for organ cases, relying on simple geometric Bauhaus-influenced shapes that are pleasing but repetitive and often careless. Some imagination has been shown here and there in designing a sinuous front with 'modern' motifs (Marktkirche, Hanover; Beckerath, 1954, fig.49) and the square or rectangular box sometimes conforms with its surroundings (Gedächtniskirche, Berlin; Schuke, 1962). Non-German builders more often tend to look at old models, as witness the influence of the Perpignan organ-case on that at Linz Cathedral (Marcussen and Andersen, 1968). Swells, either as enclosed *Oberwerk* or enclosed *Brustwerk*, were fairly common in Germany, but it is often not possible to view them as anything more than ambiguous in nature and limited in conviction, although they were seen as an acceptable compromise in America. Standard German practice in making mechanical action has done little but good, and German builders are correct to point out that 'organ music (such as Ligeti's *Volumina*) with its note-clusters, requires mechanical action. … The cluster technique shows complex flutter beats; the foreign nature of untempered, non-harmonic sound-elements can be produced only by mechanical action and its associated voicing' (*ISO Information*, viii, 1972, p.45). On the other hand, the widespread use of *Schwimmer* wind regulators, producing an inflexible and often jittery wind response, cannot in any way be regarded as a positive influence.

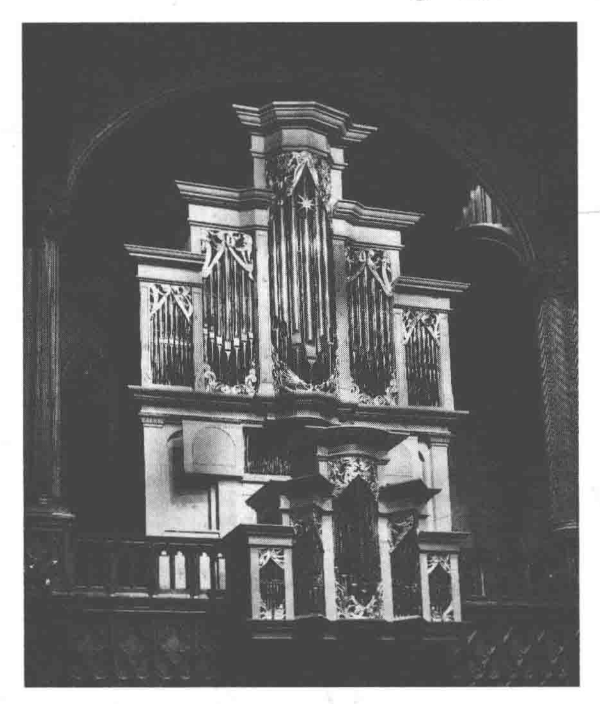


49. Organ by Rudolph von Beckerath, 1954, Marktkirche, Hanover

VIII. The organ at the close of the 20th century

During the last three decades of the 20th century such terms as 'Organ Reform' and 'neo-Baroque' ceased to be truly applicable. The original thrust of these movements was as much anti-Romantic as it was pro-Baroque. From the bottom-heavy, widely expressive, remote-controlled 'symphonic' organ of the 1920s (lacking a coherent chorus and deriving its colour from a variety of unison reeds, flutes and strings), to the top-heavy, inexpressive, mechanically controlled 'neo-Baroque' organ of the 1950s (with dogmatically dictated choruses, no strings, and deriving its colour from mutations and antique reed forms), the pendulum of taste in the organ world has swung between extremes unmatched in any other musical area save possibly that of popular music. There have always been exceptions, of course. The French made gestures in the neo-classic direction, but could never entirely shake off the influence of the Romantic organ on their music. Builders in the 'American classic' style, encouraged by the work of some of the more conservative English builders, strove, if somewhat haphazardly, to amalgamate elements of several periods into a multi-purpose instrument that had influence as far away as Italy. Only in Germany and northern Europe did the neo-Baroque aesthetic hold almost total sway at the mid-century, but the influence on the composers of those countries, and on organ building in other countries, was considerable

During the late 1960s and early 70s, a new spirit of inquiry began challenging some of the dogmas of the Reform movement while taking a closer look at the historic instruments that purported to be its models. Why, for instance, did a well-preserved 17th- or 18th-century Principal pipe speak with a full 'bloom' and just the smallest amount of 'chiff' when its neo-Baroque counterpart coughed prominently before settling into a rather thin and sizzly tone? Both had similar scales and cut-ups, open toe-holes and a seeming absence of nicking, but on closer inspection the historic pipe was found to have not the chisel-edged languid of the modern pipe but one with its leading edge blunted rather roughly with a counterface, and it had a more open windway; even closer inspection revealed details of metal composition (trace elements) and treatment (hammering or scraping) which had gone unnoticed or unheeded before. During the 1970s builders such as Wolff in Canada, Brombaugh, Fisk, Noack, Bedient, and Taylor & Boody in the USA, and Ahrend in Germany began experimenting with principals and flutes made more closely to historical models. Reeds soon followed, as analysis of various historical shallot forms (including French styles and those faced with leather), tongue brass, and tongue curvatures revealed why using standardized shallots and modern tongue materials such as phosphor-bronze did not produce a desired result. The results of these inquiries found favour with many organists concerned with the requirements and interpretation of various schools of organ literature.



If the historical research of the Reform movement in the 1930s concentrated at first on stop-lists and scales, by the 1950s, as understanding of traditional instruments developed, the value of mechanical action and free-standing casework was recognized. In 1968 an article by Charles Fisk concerning wind supply was published in *The Diapason* which generated considerable controversy internationally over most of the succeeding decade. When this had finally died down, the role of flexible wind

50. Organ by Jürgen Ahrend, 1981, Musée des Augustins, Toulouse

supply, with all that it implies relative to the size and form of bellows and wind-trunks (and even tremulants), had been accepted along with pipe metal composition and non-equal temperaments (Werckmeister, Kirnberger, Chaumont, Vallotti, Young, Fisk, van Biezen) among the last major pieces in the puzzle of the 'historically informed' organ, and many builders abandoned the inflexible modern *Schwimmer* system of wind regulation (see §II, 11(iii, v), above), that had been so much a part of the neo-Baroque organ. By the 1980s builders on the Continent (Ahrend, Flentrop, Riel, Garnier, Führer, Metzler) and in America (Fisk, Noack, Brombaugh, Bedient, Moore, Fritts, Taylor & Boody) were building organs where the wind could optionally be raised either manually or electrically. In 1981 instruments built in the 17th-century north European style by Fisk (Wellesley College, Massachusetts; fig.51) and Brombaugh (Oberlin College, Ohio) helped to confirm the validity not only of flexible wind but of mean-tone tuning and sub-semitones (split keys) in the performance of music of that period.

The early Organ Reform school concentrated on its interpretation of one particular style of organ, that of the north German Baroque. By the end of the 20th century organists and organ builders had come to a deeper understanding not only of that particular model, but of myriad other styles. Foremost among these were the French classical (Clicquot) and Romantic (Cavaillé-Coll) styles, and by the 1990s a number of organs wholly or largely patterned on both were being built; in the Netherlands, the Van den Heuvel firm specialized not in classical Dutch but Romantic French instruments. The organs of Silbermann and other central German builders also began to find emulators: Fisk and Bozeman each built a Silbermann copy in the 1980s, as did Ahrend (Jesuit church, Porrentruy, Switzerland, 1985). The south German work of Riepp has inspired at least one new instrument by Hubert Sandtner (St Andreas, Babenhausen, 1987). The unification of Germany in 1989 and the restoration in the same period of important 18th-century organs such as those in Altenburg (Trost) and Naumburg (Hildebrandt) focussed attention on the typical central

51. Organ by C.B. Fisk, 1981, Wellesley College, Massachusetts

German organ, resulting in instruments such as that built by Noack for Christ the King Lutheran Church in Houston, Texas (1995). A few builders made smaller organs in the Italian (Wilhelm, Hradetzky, Tsuji) and Iberian (Rosales, Harrold) styles during the 1990s.

In the 1980s and 90s England and America witnessed a re-evaluation of a national heritage overlooked during many years of seeking inspiration from the Continent. Although the Mander firm played an important part in the preservation of numerous 18th- and 19th-century English organs during the postwar years, the influence of these instruments did not really begin to be strongly felt in the firm's new work until the 1980s (Pembroke College, Cambridge, 1980), when other English builders such as Martin Renshaw, William Drake, and Goetze & Gwynn likewise began to concentrate on models from the Restoration and Georgian periods; in 1989 Mander built an organ for St Andrew's, Holborn, London, largely based on early Victorian models. In the USA many 19th-century organs have been sympathetically restored, and 18th- and 19th-century American builders such as Tannenberg, Erben, Appleton and Hook have had both visual and tonal influence on work by Andover, Bozeman, Dobson, Fisk, Moore and Noack, while renewed interest in organs of the early 20th century led Schoenstein to build organs in the Skinner style (e.g. St Paul's Church, Washington DC, 1996). As 'neo-Baroque' organs also became regarded as 'historic', the whole gamut of organ history became open to emulation.

The proliferation of these exercises in emulating so many earlier styles led inevitably to differences in opinion among organists, and perhaps indirectly to situations where two very different organs co-exist in certain large buildings, especially in the USA. An increasing number of builders (also probably in North America at first) began cautiously combining various styles to create a new kind of 'historically informed' eclectic instrument. One of the first examples was Fisk's large 1979 instrument for the House of Hope Church, St Paul. Its *Brustwerk* division is a virtual copy of a similar 17th-century division in Lüneburg, and the *Rückpositiv* is also largely German, with a hint of classical French. The Great, Swell and Pedal divisions are, however, carefully chosen eclectic mixtures of 18th- and 19th-century German and French styles (including both German and French Trumpets). Music from several periods and places can be played stylistically on this organ, but players must have a clear understanding of the registrational needs of any particular piece, as also with Brombaugh's similar 1986 instrument at Southern Adventist University, Collegedale, Tennessee. A 1985 Fisk (Mt Holyoke College, Massachusetts) blended German and Italian Baroque elements; a very different blending of 18th-century German, 19th-century French and 20th-century American elements characterizes Manuel Rosales's 1987 organ in Trinity Church, Portland, Oregon; and Mander's large organ at St Ignatius Loyola, New York (1992), successfully melds classical elements with later French and English colours. Such instruments succeed, not because they purport to play all music indiscriminately (they do not), but because they are carefully designed and large enough to do ample justice to more than one school or period.

In the 1990s this kind of historically informed eclecticism proliferated not only in the USA but in Britain, the Netherlands, Switzerland, Germany and even the former hotbed of neo-Baroque design, Scandinavia. That decade also saw a renewal of interest in concert hall organs which led to the restoration of older ones (the town halls at Birmingham, West Bromwich and Sydney; City Hall, Portland, Maine) and to the building of new ones largely in the new eclectic style (Meyerson Symphony Center, Dallas, Texas; Fisk, 1991). Mechanical key action became the choice of many of the younger builders and some of the older ones, but in the larger instruments of all builders the stop and combination actions were almost universally electric or electro-pneumatic, and often equipped with solid-state memory systems, MIDI capability, or both. Small organs of excellent quality (usually all-mechanical) were being built, but tended to differ tonally from similarly sized instruments of the 1950s and 60s in that they more often included an 8′ Principal on the main (or only) manual, tended to have a smaller proportion of Pedal stops to manual stops, and, if they had an enclosed division, it was more likely to be a proper interior Swell rather than simply a *Brustwerk* with shutters. Casework of organs of all sizes tended to be classical in proportion and decoration, but a few younger builders, such as the Austrian Caspar Clatter-Götz, remained committed to exploring more contemporary visual designs.

Organ-building firms became greater in number but smaller in size. In the USA two of the largest firms (Aeolian-Skinner and Möller) closed after 1970, and the only remaining firms of comparable size were Schantz, Reuter, Austin and Wicks, all makers of electric-action organs; in England the large Hill, Norman & Beard firm closed in the 1990s. Large European firms such as Klais, Schuke and Ruffatti diversified, offering organs in many styles, sizes and action types, and east European builders such as Jehmlich and Rieger-Kloss began to compete for export trade. Other older firms retrenched, including Willis, Walker, and Harrison in England, Walcker in Germany, Casavant in Canada and Rieger in Austria.

Medium-size firms (30–40 employees) began to execute the large and prestigious contracts that would once have been the province of the larger factories, and some important instruments were commissioned from even smaller and younger firms, such as Fritts in the USA, Wolff and Letourneau in Canada and Jones in Ireland.

The last decades of the 20th century also saw the growth of organ-building establishments outside Europe and the Americas. Despite a large number of imports, mainly British, organs have been built since the middle of the 19th century in Australia and New Zealand by builders such as Fincham, Hobday, Richardson, Fuller, Dodds, Jones, Pogson and South Island, but it was not until Ronald Sharp built a mammoth five-manual organ in 1979 for the new Sydney Opera House that an Australian-born organ builder gained prominence. A Western-inspired organ culture also took root in Asia. Ever since the 19th century small numbers of organs have been exported to Hong Kong, Korea and mainland China, but Japan emerged as the major Asian organ centre. During the final three decades of the 20th century a large number of organs of all sizes, chiefly all-mechanical or with mechanical key action, were exported by European and North American builders to Japanese colleges, concert halls, private houses, Christian churches and Buddhist temples. Organ playing began to be taught in many colleges and conservatories, organ recitals were well attended, and an active Japan Organ Society founded a scholarly journal. Excellent organs began to be constructed in Japan by several native builders, among whom Hiroshi Tsuji and Tetsuo Kusakari were the earliest to establish workshops.

Late 20th-century developments in organ research and design did much to further understanding of the repertory of all times and places. But the 'historically informed' organ also attracted the attention of a growing number of composers who, unlike many in the previous generation, were more interested in exploring its potential as a musical medium than in treating it as a sound-effects machine. Other trends, however, were more disturbing to some and challenging to others, especially the encroachments of electronic technology. Solid-state switching gained widespread acceptance in larger organs as a compact and reliable alternative to all-electric or electro-pneumatic systems, and computerized 'memory' in combination actions was welcomed with enthusiasm by organists. MIDI can be applied to most organs, even those with mechanical key action, and offers access to synthesizer effects for some kinds of contemporary music, as well as playback options (in which it is simply duplicating the function of the early 20th-century roll-players). More controversial to many players and builders has been the incorporation of electronically produced tone into otherwise traditional organs, although some builders had already been doing this in order to add 32′ Pedal tone in situations where finances or space precluded using real pipes. By the end of the century, however, whole divisions were being added electronically: an organ might have one or two divisions of (mostly) pipes, a second or third of electronic tone-generators, and a Pedal division combining both. The greatest appeal of such frankly hybrid instruments is to smaller churches with limited space and funds, although a few larger ones have been manufactured. Such developments have, predictably, encouraged polarization between the proponents of historically influenced traditional organs on the one hand, and those who regard organs more from a technological and commercial standpoint on the other. However, the long history of the organs tells us that this 'large wind instrument' (as the builder Metzler has described it) has faced many other cultural and technological challenges in past centuries, and all that is certain is that yet more intriguing chapters in its continuing saga will open as the future unfolds.

Organ chorale. An organ composition based on a traditional German Protestant chorale melody. *See* CHORALE SETTINGS.

Organette. A portable self-playing REED ORGAN. It enjoyed an enormous popularity between 1880 and the early 1900s. The first automatic keyboardless instrument of this type was the Cartonium made in 1861 by J.A. Testé of Nantes. A series of sprung metal fingers were held down by a strip of perforated cardboard which was drawn across these fingers by friction rollers. Where a hole appeared in the card, the relevant lever would rise, so opening a pallet to a reed and allowing air to be sucked in to an exhaust bellows worked by a hand crank. Further developments took place simultaneously in Germany and in the USA. While most German organettes worked on Testé's mechanical fingers and vacuum principle, American makers generally adopted the pneumatic 'paper-as-a-valve' system in which a music roll of perforated paper is drawn across a row of openings in a block or tracker bar. The pneumatic system, adopted in the later pneumatic piano player and PLAYER PIANO, enabled instruments to be made very cheaply. Huge numbers of instruments were made: sales of the Leipzig-made Ariston, for example, had exceeded 300,000 by 1893 while the repertory of tunes available numbered over 4000 titles and 6 million of the cardboard tune-discs had been punched out. The tonal range of the organette was never fully chromatic and usually compromised between 14 notes and 28 notes, although Vocalion's Syreno had a 46-note compass (one version of this, the Tonsyreno, was provided with a keyboard). Other makes of organette models included Ariosa, Ariston, Cabinet Organ, Celestina, Gem Roller Organ, Herophon, Intona, Kalliston, Organina, Phoenix and Seraphine. Alternative forms of musical programme to the perforated paper roll or cardboard or metal strip included punched metal or cardboard discs, punched music in ring (annulus) form, endless card or paper bands, and small pinned wooden barrels of the barrel organ type. One instrument played 'square discs' by rotating the entire player mechanism beneath the perforated tune-sheet. For a discussion of larger self-playing organs (other than the BARREL ORGAN type), *see* PLAYER ORGAN.

Organ hymn. A liturgical form in which the organ replaced the odd-numbered or even-numbered stanzas of a plainsong hymn, alternating with the choir. It is convenient to consider other *alternatim* forms used in the Office at the same time, in particular the *Te Deum*, *Magnificat* and *Salve regina*. Antiphons to psalms and canticles were also set, especially in England, but they are complete in themselves and not in the strict sense *alternatim*.

The earliest extant music in these forms dates from the early 15th century, but there are earlier references to *alternatim* singing, especially of the *Te Deum*. A passage in Dante's *Purgatorio* (ix.142–5) appears to refer to this. At Essen in the 14th century a triple scheme of alternation was devised for the singing of the *Te Deum* after the performances of the Easter sepulchre play at Matins: the organ began, the canonesses in whose convent the performance took place sang the second verse, the clerks (men in orders) sang the third, and so on to the end. At St Albans in 1396 the *Te Deum* was sung 'alternantibus organis' at the reception of an abbot.

The earliest source of liturgical organ music, the Faenza manuscript (*I-FZc* 117), contains in addition to organ music for the Mass a single verse of the hymn *Ave maris stella*, what may be conjectured to be three verses for a *Magnificat*, and the response *Deo gratias* to a melody for the *Benedicamus domino* for the Office; all are untitled in the manuscript. The provision of only a single hymn verse and of fewer than the required number of verses for the *Magnificat* (which needs six) seems strange but is characteristic of continental sources up to the mid-16th century. It is possible that single hymn verses were intended merely as preludes, but it is more likely that they were written down as samples of what could be readily improvised to provide a complete *alternatim* structure. *Magnificat* fragments are found in early 15th-century German sources, among them Paumann's *Fundamentum organisandi* (1452), which also contains the verse 'O clemens' of the *Salve regina*. The Buxheimer Orgelbuch (*c*1470) has four *Magnificat* fragments, two complete settings (with five organ verses) of the *Salve regina* and two hymn verses: *Veni Creator Spiritus* and *Pange lingua*, the latter merely an arrangement of a vocal piece by Touront.

Early 16th-century German tablatures favoured the *Salve regina*. The Basle manuscript of Hans Buchner's *Fundamentum* (dated 1551) contains only three hymn verses, two verses for the *Te Deum* and two responds for the Office. There are a few hymn verses in the Lublin tablature (CEKM, vi/2, 1964–7). The hymn is better represented in Italy. Apart from a hymn verse and a *Magnificat* verse in an early 16th-century manuscript of keyboard dances (*I-Vnm* ital.iv.1227; ed. K. Jeppesen, *Balli antichi veneziani per cembalo*, Copenhagen, 1962), the two organ publications of Girolamo Cavazzoni (1543 and before 1549) contain between them 12 single hymn verses and four five-verse settings of the *Magnificat* (they lack the verse 'Et misericordia'). The sixth of the seven books of keyboard music published by Attaingnant in Paris in 1531 contains eight settings of the *Magnificat* with from two to five verses, and *alternatim* verses for the first and third sections of the *Te Deum*. In Spain the *Libro de cifra nueva* edited by Luis Venegas de Henestrosa (1557) included, apart from some isolated single hymn verses, sets of verses for *Pange lingua* and *Ave maris stella* by Cabezón. Further settings of these two hymns (with yet more isolated verses) occur in Cabezón's posthumous *Obras* (1578); only two single verses are identical with any from the 1557 edition, and the general impression is

of an unwieldy mass of material from which selections for *alternatim* performance might be made.

For a full appreciation of the *alternatim* possibilities of the organ hymn one must turn to the English organists. Even in this repertory (published in EECM, vi, 1966–9) there are a number of isolated hymn verses, and series of verses which are too many or too few for *alternatim* performance of the hymn to which they belong. But there are enough regular sets to show that English composers of the first half of the 16th century regarded the complete hymn as a single entity. Except in settings of the nine-verse hymn *Aeterne rerum conditor*, which is regularly given four organ verses, the organ is normally allotted the odd-numbered verses. Occasionally the first line of the first verse is left to be intoned by a *cantor*, as in English settings of the *Te Deum*, *Magnificat* and certain Mass chants. The two most important collections of hymns are found in different sections of the same manuscript: *GB-Lbl* Add.29996. Those of the former are mostly by John Redford (*d* 1547); those of the latter, though anonymous, may be by Thomas Preston. All English organ hymns are based on a cantus firmus, which may be either the appropriate plainsong (sometimes heavily adorned) or the faburden of the chant, which also may be highly ornamented. Since the faburden need not strictly follow the melodic contour of the chant, the degree of sophistication in the treatment of the cantus firmus was sometimes very considerable.

Alternation between choir and organ was not banned by the Council of Trent, and organ hymns and settings of the *Magnificat* were published in the early 17th century by Frescobaldi and, most memorably, by Titelouze (hymns in 1623, *see* SOURCES OF KEYBOARD MUSIC TO 1660, fig.3, *Magnificat* settings in 1626), whose works are lengthy essays in an imaginative brand of traditional counterpoint. There are also numerous examples in Italian and Spanish manuscripts of the 17th century; in Spain a local triple-time tune for *Pange lingua* was especially favoured. In France, the hymn was among the items in which organ alternation was permitted (Higginbottom). But the organ hymn did not develop much beyond this point, perhaps because even where alternation was still permitted it was more convenient to improvise than to write down so many versions of a single tune. In the Protestant countries the organ hymn gave way to the organ chorale. There was a considerable amount of continuity, not only because earlier German composers had made settings of German religious songs (for example the settings of *Maria zart* by Schlick and of *Christ ist erstanden* by Buchner and in the Buxheimer Orgelbuch) but also because some Latin hymns remained in the Lutheran liturgy. The principle of alternation was lost; but the musical substance of the genre remained in the form of the set of chorale variations.

Organi, Bartolomeo degli. *See* BARTOLOMEO DEGLI ORGANI.

Organino (i) (It.). A term for a small organ, notably the 14th- and 15th-century instrument generally known as PORTATIVE.

Organino (ii). A free-reed instrument based on the regals said to have been made by Filippo Testa in 1700; a precursor of the REED ORGAN.

Organistrum. *See* HURDY-GURDY.

Organized piano [Organ-piano]. A piano, usually a square, to which organ pipes have been added. *See* CLAVIORGAN.

Organ mass. A collection of versets for the organ replacing parts of the Ordinary and Proper of the Mass and played in alternation with the sung portions. The term ALTERNATIM is frequently used to describe the practice of dividing sections of a liturgical text between organ and choir. The choir normally sings a plainchant setting of the Mass when alternating with the organ. The practice belongs almost exclusively to the liturgy of the Roman Catholic Church.

The extant literature of organ masses covers most of Western Christendom and some 500 years of music history, beginning about 1400 with the organ versets in *I-FZc* 117 and ending late in the 19th century with works such as Justin's *L'organiste à la messe ... 11 messes: plainchant alternant avec l'orgue* (1870).

1. Ecclesiastical legislation and the liturgy: (i) *Alternatim* practice in the Ordinary (ii) *Alternatim* practices in the Proper. 2. The extant literature: (i) The use of plainchant (ii) *Alternatim* styles (iii) History.

1. ECCLESIASTICAL LEGISLATION AND THE LITURGY. The organ mass is essentially a practice and not a musical form, and as such it came to be regulated by ecclesiastical prescription. The earliest document issued by the Apostolic See to refer in detail to liturgical organ music is the *Caeremoniale episcoporum* or 'Bishops' Ceremonial' of Pope Clement VIII (Rome, 1600). This permits the use of the organ each Sunday, except those during Advent and Lent, and on all important feast days, and it lists the moments in the offices when the organ might intervene. The section concerning the Mass reads:

> At the solemn Mass the organ is played *alternatim* for the Kyrie eleison and the Gloria in excelsis ...; likewise at the end of the Epistle and at the Offertory; for the Sanctus, *alternatim*; then more gravely and softly during the Elevation of the Most Holy Sacrament; for the Agnus Dei, *alternatim*, and at the verse before the post-Communion prayer; also at the end of the Mass.

This arrangement, which had already been practised in broad outline for over 200 years, was maintained until the beginning of the 20th century. It was sustained not only by the authority of the *Caeremoniale espiscoporum* but also by the numerous local diocesan ceremonials, and by ceremonials published for the use of religious orders. It was finally changed by Pope Pius X, whose *Motu proprio* (1903) imposed a formal ban on *alternatim* organ music in general.

(i) Alternatim practice in the Ordinary. The *Caeremoniale episcoporum* omits to describe the manner in which

the texts of the Ordinary were to be apportioned. The instruction *alternatim* is clearly intended to suffice. A fairly standard division of the text is revealed in extant organ masses of the 16th century, and continues in later sources. The division for the Kyrie, Gloria and Agnus Dei customarily falls into the following pattern (portions taken by the organ are shown in italics):

Kyrie eleison. Kyrie eleison. *Kyrie eleison.* Christe eleison. *Christe eleison.* Christe eleison. *Kyrie eleison.* Kyrie eleison. *Kyrie eleison.*
[Intonation: Gloria in excelsis Deo.] *Et in terra pax hominibus bonae voluntatis.* Laudamus te. *Benedicimus te.* Adoramus te. *Glorificamus te.* Gratias agimus tibi propter magnam gloriam tuam. *Domine Deus, rex caelestis, Deus pater omnipotens.* Domine fili, unigenite Jesu Christe. *Domine Deus, Agnus Dei, filius patris.* Qui tollis peccata mundi, miserere nobis. *Qui tollis peccata mundi, suscipe deprecationem nostram.* Qui sedes ad dexteram Patris, miserere nobis. *Quoniam tu solus sanctus.* Tu solus Dominus. *Tu solus altissimus, Jesu Christe.* Cum Sancto Spiritu. *In gloria Dei patris. Amen.*
Agnus Dei qui tollis peccata mundi, miserere nobis. Agnus Dei qui tollis peccata mundi, miserere nobis. *Agnus Dei qui tollis peccata mundi, dona nobis pacem.*

The Sanctus and Benedictus might be subject to various arrangements, including one in which the Benedictus was subsumed by a piece of organ music at the Elevation (Schaefer, 1987). In the French classical tradition the Sanctus was often treated thus (organ versets in italics):

Sanctus. Sanctus. Sanctus Dominus Deus Sabbaoth. Pleni sunt caeli et terra gloria tua. Hosanna in excelsis. *Benedictus qui venit in nomine Domini. Hosanna in excelsis.*

In all, this makes 19 organ versets: nine for the Gloria, five for the Kyrie, two each for the Sanctus and Agnus and one for the Benedictus (although strictly speaking the Benedictus is not *alternatim*). The text of the Credo, according to the *Caeremoniale episcoporum*, was not to be divided between organ and choir although before 1600 organ versets had appeared quite frequently for the Credo, as for instance in Cavazzoni's *Intabulatura d'organo . . . libro secondo* (?1543) and in the Mass *'Kyrie fons bonitatis'* of Attaingnant's publication *Tabulature pour le jeu d'orgues* (1531). Such settings were clearly no longer generally acceptable after the Counter-Reformation.

The *alternatim* pattern given above is the one intended for such famous organ masses as François Couperin's *Messe pour les paroisses* (1690). Variations in this pattern after the beginning of the 16th century are found normally only in the distribution of the versets for the Gloria and the Sanctus and Benedictus, although variations of course occur when the Gloria is troped: the *Missa de Beata Virgine* from Cavazzoni's *Intabulatura* includes such a Gloria setting with 12 versets. An earlier example, also with Marian tropes, is to be found in the Buxheim Organbook (*c*1470, in *D-Mbs*). The practice of troping was banned by the Council of Trent.

Whether or not an Elevation verset was part of an *alternatim* sequence for the Benedictus, the *Caeremoniale episcoporum* specifically stipulated quieter and more serious music at this moment. Frescobaldi's three *Toccate per l'elevatione* from his *Fiori musicali* (1635) exemplify the intensely expressive music deemed appropriate (Tagliavini, 1984). There is also a beautiful *Tierce en taille* for the Elevation in Couperin's *Messe pour les couvents* (1690).

At the very end of the Mass, the organ normally responds with 'Deo gratias' to the priest's 'Ite missa est'.

(ii) Alternatim practices in the Proper. The *Caeremoniale episcoporum* mentions the intervention of the organ 'at the end of the epistle', 'at the offertory', and 'at the verse before the post-communion prayer'; in other words, at the gradual or alleluia or both, the offertory, and the communion. But once again it does not indicate the distribution of the texts of these items between the organ and the choir. It is difficult to gain an overall view of practices concerning the Proper (with the notable exception of the offertory) from musical examples, since these are distributed very unevenly over time and place.

Although Clement's ceremonial does not refer to the introit in connection with *alternatim* practices, some organists had been accustomed to producing versets for this item (for example, there are settings in the Buxheim Organbook, an elaborate three-verset setting of the introit *Resurrexi* in Thomas Preston's *Missa in die Paschae*, ed. in EECM, x, 1969, no.5, and all of 47 settings in the Leopolita Tablature, *c*1580). In all, Lynn has located 104 organ settings from the period *c*1460–*c*1630. But extant examples from after the early 17th century are few, and the practice is hardly mentioned in ceremonials. An exception occurs in a German *Caeremoniale benedictinum* published in Dillingen in 1641: the choir is instructed to begin the introit, the organ to play the verse, the choir to sing 'Gloria' and 'Sicut erat', and the organ to repeat the antiphon.

Organ music at the gradual and alleluia on the other hand was clearly used as frequently after 1600 as before. The *alternatim* patterns seem to vary greatly, and it is not always certain that *alternatim* in its strict sense was intended. For instance, a *Caeremoniale monasticum ... ordinis S. Benedicti* (Toul, 1695) reads: 'afterwards the organ plays the whole of the gradual with its verse'. This may also be the meaning of Banchieri's instruction in his *L'organo suonarino*: 'Finita l'epistola una toccata del primo tuono' (cf Frescobaldi's *Canzone dopo l'epistola* in his *Fiori musicali*). If, however, the gradual was sometimes replaced entirely by the organ, then other ceremonials demand no less clearly an equal division between organ and choir. A *Rituale cisterciense* (Paris, 1727) instructs the organ to begin and the choir to take over at the verse: 'Post epistolam pulsatur ad responsorium, sed versum sequentem ... cantat chorus'.

There remain few organ versets for the gradual. Thomas Preston's two-verset setting of *Haec dies* from his *Missa in die Paschae* is a rarity, as is Gaspard Corrette's single-verset gradual in his *Messe du 8e ton* (1703). A late 18th-century French manuscript entitled *Livre d'orgue pour la Chapelle royale* (in *F-V*) gives the plainchant intonation for each gradual for the feasts on which the organ was played, leaving the precise nature of the organist's intervention unclear.

Instructions on the performance of the alleluia are often more specific: Banchieri (*L'organo suonarino*) wrote, 'Dopo l'alleluia, e versetto si replica l'alleluia', a clear indication that the organ takes up the repeat of the alleluia after the verse. Among those ceremonials which mention *alternatim* alleluias, some allow the organ to intervene only at the last jubilus of the repeat. Others, including the famous *Caeremoniale parisiense* (Paris, 1662), also allow the organ to play the repeat of the alleluia before the verse. The Versailles *Livre d'orgue* mentioned above gives the chant for the intonation of each alleluia. Thomas Preston provided a unique set of alleluia versets in his *Missa in die Paschae*.

By way of contrast, extant offertory versets are numerous, and they show that the intervention of the organ at the offertory was standardized at an early date. From the English pre-Reformation settings of the Marian antiphon *Felix namque* to the French *offertoires* of the 19th century the formula was the same: the intonation of the offertory antiphon was sung and the organ played from then onwards. This very simple form of alternation eventually led composers to treat the offertory with a considerable degree of freedom, for once the custom of using the plainchant as a cantus firmus had passed, even the obligation to match the mode of the sung intonation was forgotten: there was no ensuing choir verset to accommodate. Indeed, the *offertoires* of the French classical school were simply free-standing pieces, written on a large scale to span the liturgical ceremonies at this point in the Mass.

It appears to have been common practice to use the organ at the communion antiphon. A *Caeremoniale monasticum* (Paris, 1634) reads: 'play *alternatim* at the antiphon which is said at the communion'. The organist might also be required to provide music during the distribution: 'ad communionem cleri et populi pulsatur organum' (*Ceremoniale lexoviense*, Lisieux, 1747). But it is not clear whether such versets as the one headed 'pour la communion' in Grigny's *Premier livre d'orgue* (1699) are intended for use during the communion, or for the communion antiphon, or for both at once. The communion antiphon would be treated in the same way as the offertory: intonation and then organ verset.

These practices, variously described by the official texts of the Roman Catholic Church, were not in the main copied by the Protestant reformed churches. The exceptions (bits of an *alternatim* mass in the third part of Scheidt's *Tabulatura nova*, 1624) were hangovers, and soon fell into disuse. The matter of J.S. Bach's so-called organ mass is considered below (§2(iii)).

2. THE EXTANT LITERATURE. The extant examples of *alternatim* organ music for the Mass should be seen in their correct perspective: they are the recorded monuments of what was above all an improvisatory art, long practised by countless organists in innumerable churches. If some organ masses have been written down, they are but the most minute fraction of the organ music to which the practice of *alternatim* gave birth. Their notated form allowed them to serve as exemplars and (more modestly) to supply the less competent improvisers with something to play. Most extant organ masses consist of versets for the Ordinary. Versets for the Proper were less easy to supply in any useful fashion on account of the wide repertory of chants involved.

(i) The use of plainchant. Until the middle of the 17th century it was normal for the portion of plainchant replaced by the organ to be used structurally in the organ verset itself. Even after 1650 plainchant continued to exert its influence, but only rarely as a structural element, at least until the reappearance of strict cantus firmus techniques in the middle of the 18th century. The plainchant masses upon which organ versets for the Ordinary were most commonly based were those used on Sundays and the principal feasts of the Church's calendar. In the modern Gradual they are known as: *Cunctipotens genitor Deus* (IV), *Cum jubilo* (IX) and *Orbis factor* (XI) (the figures in parentheses show modern enumeration).

Where organ versets are not built upon the plainchant they replace, there may be some difficulty in identifying the plainchant with which they were intended to alternate. Crucially, of course, the organ had to remain in the tonality appropriate to the mode of the plainchant being used by the choir. So, for example, Gaspard Corrette's *Messe du 8e ton*, although not structurally based on any particular chant, was written for use with a plainchant setting in the 8th mode, or one compatible with the key of G major. It could not, therefore, alternate with the setting *Cunctipotens genitor Deus*.

(ii) Alternatim styles. The liturgical use of the organ in the Mass juxtaposed organ music and plainchant. The plainchant itself was subject to vastly different readings and interpretative styles, some of which led to vocal performances of the chant coming very close to the tempo and rhythmic articulation of the cantus firmus in the organ verset. In some places improvised discant might have been employed by the singers (called 'chant sur le livre' in France). In other places, notably France from the second half of the 17th century, newly composed 'plainchant' was used alongside the organ versets (see below). Evidence for the use of the organ to support the sung portions of plainchant is largely lacking. Several factors make it highly unlikely that the organ participated as both solo and accompanimental instrument on any regular basis. Evidence for the use of 'polyphonic' vocal settings in alternation with the organ is more plentiful, though not all of it is unambiguous. Mahrt (1969) argued that the polyphonic masses of Heinrich Isaac may have been used *alternatim* with organ. Certainly polyphonic settings of strophic items, such as hymns and canticles, might have been so employed. The problem with the Ordinary of the Mass is that its forms are not strophic in the same way. Nevertheless, a ceremonial for the French diocese of Toul (*Cérémonial de Toul*, 1700) explains in detail how vocal music (*chant figuré* as opposed to plainchant) might be accommodated within the tradition:

> At the Mass one plays five times at the Kyrie when it is sung in the choir in plainchant; four times when it is sung 'en musique' [i.e. organ–Kyrie–organ–Christe–organ–Kyrie–organ]; and twice only when the musicians sing Kyrie, Christe, Kyrie without a break [i.e. organ–Kyrie+Christe+Kyrie–organ].

This ceremonial also explains that when the Gloria is sung 'en musique', the organ does not intervene at all. For the remainder of the Ordinary 'en musique', the organ plays once before the Sanctus, for the Benedictus and for the first and third Agnus. A similar scene is used in several vocal mass settings by Marc-Antoine Charpentier. His *Messe pour le samedi de Pâques à 4 voix* contains instructions for the interpolation of organ versets in the Kyrie and Sanctus. The Benedictus is wholly sung. (The Agnus is omitted in accordance with liturgical practice on Holy Saturday.) The Sanctus bears the following rubrics: 'Premier Sanctus pour l'orgue sur le plein jeu'; 'Second Sanctus' (polyphonic vocal setting); 'Troisième Sanctus pour l'orgue sur les petits jeux'; 'Pleni sunt ... in excelsis' (to a polyphonic vocal setting). Here therefore, Charpentier introduced the organ between the second 'Sanctus' and 'Pleni sunt'. Somewhat later Michel Corrette published a collection of masses (*Quatre messes à deux voix égales, avec l'accompagnement de l'orgue à l'usage des dames religieuses*) showing the alternation of vocal settings and organ versets. In the second and third masses only half of the liturgical text is set (including the Gloria),

Corrette directing the organist to interpolate versets at the breaks. Appropriate versets, according to a note at the head of the second mass, were to be found in the composer's 'Ie livre d'orgue', referring not to Corrette's *Premier livre* but to a much later 'livre Ir' of *Pièces pour l'orgue dans un genre nouveau à l'usage des dames religieuses*.

(iii) History. The manuscript *I-FZc* 117 (*c*1400; complete facsimile in *MD*, xiii–xv, 1959–61, and MSD, x, 1962; ed. in CMM, lvii, 1972) contains two Kyrie–Gloria sets (one incomplete) and a single Kyrie verset. This transcription shows a tenor plainchant cantus firmus in predominantly long, equal note values over which a lively discantus dances. No less reminiscent of 12th-century St Martial organa are the versets found in the earliest extant German sources, the so-called Sagan Manuscript (*PL-WRu*, *c*1425) and the Wynsem Manuscript (*D-Bsb*, *c*1430; both ed. in CEKM, i, 1963). The first includes three versets for the Gloria, the second a Sanctus and incomplete Credo.

A more flexible approach to the cantus firmus is found in the three-part settings belonging to the Buxheim Organbook (*D-Mbs, c*1470). Here the plainchant is organized rhythmically. This source contains (in addition to the troped Gloria mentioned above, several settings of the Kyrie, a single Credo and a Sanctus) versets for three introits.

Two English organ masses survive from the very early years of the 16th century: *Missa in die Paschae* by Thomas Preston, which consists exclusively of settings of the Proper, and a complete setting of the Ordinary, with a troped Kyrie for Trinity Sunday, by Philip ap Rhys (EECM, x, 1969, no.1). There remain also a significant number of English offertory versets, among which *Felix namque* settings predominate. The offertory antiphon *Felix namque* was prescribed for Lady Masses. (Surviving examples of pre-Reformation English organ music for the Mass are transcribed in EECM, x (1969).)

The two earliest extant French organ masses also date from the first half of the 16th century. Moreover, they are the first printed organ masses. They appear in Attaingnant's *Tabulature pour le jeu d'orgues* (1531), which set the pattern for printed organ masses for the next 200 years. The versets are for the Ordinary and, with the exception of those for the Kyrie of the Mass *'Kyrie fons bonitatis'*, based on the fourth plainchant. This setting (*Cunctipotens genitor Deus*) was favoured (and continued to be favoured in France) for 'annual and solemn feasts'. The plainchant is still treated as a strict cantus firmus, mainly in the bass.

Cavazzoni, in his *Intabulatura d'organo ... libro secondo* (?1543), was one of the first composers to break away from the strict cantus firmus style and to produce a more unified texture. His versets normally start with a compact series of imitative entries, taking the plainchant incipit as their 'point', and proceed to a fuller statement of the plainchant, either in the soprano or in the bass. The *Intabulatura* contains three masses, *Missa apostolorum* (IV), *Missa domenicalis* (XI) and *Missa de Beata Virgine* (IX). The same basic titles, and the same plainchants, occur in the three organ masses by Andrea Gabrieli (in one of the Turin tablatures, *I-Tn*) and in those by Claudio Merulo (*Messe d'intavolatura d'organo*, 1568). Organ versets for the Mass also appear in the work of Hans Buchner (*Fundamentum*) and Cabezón, and in a Polish manuscript (*PL-Kp*: the Lublin Tablature).

Towards the end of the 16th century and the beginning of the 17th the extant literature of organ versets from the Catholic parts of Germany is much slighter than from Italy, but there are manuscript sets of versets for the mass by Hans Leo Hassler (one complete in the Turin manuscripts) and Christian Ehrbach (five Kyries and one Gloria), which show that *alternatim* organ music was in use. An anonymous German 16th-century source contains three masses in organ tablature (Wolff, 1994).

The 17th century is the most important in the history of the organ mass, both for the number of publications and for the degree of technical accomplishment. Banchieri's treatise *L'organo suonarino* (1605), of which the third edition (1622) contains a *Missa alla domenica*, was followed by Bottazzi's *Choro et organo* (1614), Frescobaldi's *Fiori musicali* (1635), Salvatore's *Ricercari ... e versi per rispondere nelle messe* (1641), Croci's *Frutti musicali* (1642) and Fasolo's *Annuale* (1645), each of which contains three masses: the familiar Mass for the Apostles, Mass for Sunday and Mass for Our Lady. Frescobaldi's publication is exceptional in that, of the Ordinary, only the Kyrie is set. The remaining pieces are for the processional ('avanti la Messa'), the gradual ('dopo l'epistola'), offertory ('dopo il Credo'), the Elevation and the post-communion. The Kyries use the normal plainchants, but for each mass there are more than five versets; clearly some are alternatives.

In France also, publications containing organ masses abound, beginning at about the time that Italian publication ceased: Nivers' *2e livre d'orgue* (1667), Lebègue's *Second livre d'orgue* (n.d.), Gigault's *Livre de musique pour l'orgue* (1685), Raison's *Livre d'orgue contenant cinq messes* (1688), Grigny's *Premier livre d'orgue* (1699) and the most outstanding masses of the French classical school, those of François Couperin (ii) in his *Pièces d'orgue consistantes en deux messes* (1690). There are also settings in manuscript: two in an anonymous *livre d'orgue* formerly belonging to Marguerite Thiery (now in *F-Pc*), another in an anonymous collection of organ music sometimes attributed to Jean-Nicolas Geoffroy (all three published in A.C. Howell: *Five French Baroque Organ Masses*, Lexington, Kentucky, 1961), and five in the *Livre d'orgue de Montréal*, a late 17th-century compilation of Parisian provenance (ed. E. Gallat-Morin, Paris and Montreal, 1988).

With the emergence of the French classical school, notable changes are found in compositional techniques. The old polyphonic structures were discarded in favour of the new concertato style: the *récit*, the *Tierce en taille*, the *basse de trompette* and the *dialogue* appeared; the old forms were transformed into the *fugue*, the *plein jeu* and the *fond d'orgue*, and the organ was exploited for its variety of colour. The structural use of plainchant diminished to such an extent that the Paris diocese actually directed (in the *Caeremoniale parisiense*) that the plainchant in use should appear, completely unaltered, in the versets for the first and last Kyrie, at the words 'Et in terra pax ... suscipe deprecationem nostram' and 'In gloria Dei patris. Amen' of the Gloria, and also in the versets for the first Sanctus and Agnus. However, the full force of this injunction appears seldom to have been felt by composers. Even so sensitive a liturgist as Nivers only went so far as to observe it for the first versets of the Kyrie, Gloria,

Sanctus and Agnus. A similar compromise was reached by both Couperin (in his *Messe pour les paroisses*) and Grigny, with the exception in Couperin's case of a cantus firmus setting of the last Kyrie. The treatment of the cantus firmus plainchant in these instances is often rather selfconscious, partly because the standard registration for versets with a cantus firmus calls for the plainchant to be played on the loudest stops of the organ: the pedal Trompette and Clairon. This contrasts with the easy manner in which other versets may freely paraphrase the plainchant.

In other settings, notably Couperin's *Messe pour les couvents* and the five masses of Raison's *Livre d'orgue* (1688), the demands of the Paris ceremonial seem to be totally ignored, but for understandable reasons. These organ masses were intended for use in religious houses where the diocesan ceremonial had no jurisdiction, and where local usages existed, such as the employment of special chants for the Mass. Many of these chants were often newly composed (i.e. *messes musicales*) and required organ versets which remained in the same key throughout the Ordinary, unlike organ masses written to alternate with the fourth plainchant. It was these demands which Couperin and Raison had to meet. Raison's publication with its variety of keys is intended to supply versets for any *messe musicale*. Interestingly, Couperin's *Messe pour les couvents*, written in the 8th mode (more or less G major), conforms to the key needed for alternation with Nivers' 'plainchant' setting for feasts of the first solemnity, transposed from F to G (perhaps to suit nuns' voices). Nivers' *messes musicales* were in wide circulation in service books published for the use of monastic orders.

French organ masses continued to dominate the scene in the 18th century. Although Gaspard Corrette's *Messe du 8e ton* (1703) stands firmly in the classical tradition, his son Michel was responsible for a new development in compositional technique, altogether uncharacteristic of the classical school. Each of the four masses of his *IIIe livre d'orgue ... contenant les messes* (1756) consists of versets written almost without exception upon a strict plainchant cantus firmus in the bass. This return to cantus firmus settings became very popular and continued well into the 19th century, but whatever its liturgical advantages it produced nothing of artistic merit (van Wye, 1995).

The French also cultivated the *messe en noëls*, which became a notable Christmas attraction in fashionable Paris churches. Here each verset is based upon a popular Christmas carol. Claude-Bénigne Balbastre was renowned for his improvised *messes en noëls*, and some examples by Benaut survive. The cult of the organist as entertainer also led to extravagant and entirely inappropriate versets for the offertory. The Mass in F by Benaut contains an *offertoire* in several sections inscribed: 'Prélude, ou Réveil de chasseurs', 'Chasse flamande', 'Repos de chasse, tempo di minuetto', and 'Retour de la chasse'. These trends continued into the 19th century with Christmas enlivened by such works as Alexandre Boëly's *Messe du jour de Noël ... sur les airs populaires anciens* (1842), while the general production of organ music for the Ordinary continued with such works as the *Livre d'orgue* op.26 of J.A. Miné. The style of Miné's versets is similar to Michel Corrette's, but still simpler. They consist of little more than harmonizations of a plainchant bass, of negligible musical interest (van Wye, 1970). Some 19th-century Italian sources reveal a more ambitious approach. Vincenzo Petrali (1832–89) published versets for the Mass on the scale and in the character of operatic arias and interludes.

The case of the third part of J.S. Bach's *Clavier-Übung* being called an organ mass (first by E. Krieger in 1930) forms an interesting footnote to this account. Despite the intriguing appearance of versets for the Kyrie and Gloria in the third part of Scheidt's *Tabulatura nova* of 1624 (see Herman, 1969), the use of *alternatim* organ music for the Mass was generally not adopted by the Lutheran Church, nor indeed by any of the reformed churches. Book 3 of Bach's *Clavier-Übung* provides for the Mass only in the sense that it contains elaborate chorale preludes on Lutheran chants for the Kyrie and the Gloria. Bach's organ music 'sub communione' (e.g. *Jesus Christus, unser Heiland* BWV665) had a specific liturgical role in the Mass, one with which the chorale partitas have also been associated (Clement, 1991). However, there is no *alternatim* practice at work here.

Although the Roman Church banned *alternatim* organ music after 1903, much music for use during the Mass has of course been written since then (Kotek, 1974). Messiaen's *Messe de la Pentecôte* (1949–50) is a notable example. It consists of five movements (the term 'verset' is no longer appropriate): 'Entrée', 'Offertoire', 'Consécration', 'Communion' and 'Sortie'.

Organ music. *See* KEYBOARD MUSIC, §§I–II.

Órgano, canto de. *See* CANTO DE ÓRGANO.

Organochordium [organochordon]. A type of CLAVIORGAN built in 1782–9 by the Danish organ builder Kirschnigk and developed by G.J. Vogler, with Rackwitz of Stockholm. *See also* REED ORGAN, §1.

Organology (Ger. *Instrumentenkunde*). The study of musical instruments in terms of their history and social function, design, construction and relation to performance. Organology has interested scholars since at least as early as the 17th century. Praetorius, in his *Syntagma musicum* ii (1618) provided an important section on instruments, including some non-Western types, with realistic illustrations drawn to scale (*Theatrum instrumentorum*, 1620). Other technical discussions appear in the encyclopedic works of Mersenne (1636) and Kircher (1650). Modern organologists and reproducers of historical instruments (who might be called 'applied organologists') have benefited from the observations of such early scholars, particularly in cases where well-preserved original instruments are rare or nonexistent. In addition to providing practical information useful to performers and instrument makers, organologists seek to elucidate the complex, ever-changing relationships among musical style, performing practices and evolution of instruments worldwide. This study involves authenticating and dating old instruments by scientific means, discerning the methods by which instruments of different cultures have been designed and produced and investigating the many extra-musical influences – such as advances in technology and changing economic conditions – that lead to innovation and obsolescence. The symbolism and folklore of instruments are subjects that organology shares with music iconography and ethnomusicology.

Since the late 18th century, interest in instruments of all kinds has served an ethnomusicological purpose by providing a common avenue of approach to the music of diverse cultures. Guillaume André Villoteau (1759–1839) made the first scientific study of ancient Egyptian music largely on the basis of depictions of instruments in tombs and temples; later archaeological discoveries of actual if fragmentary Egyptian instruments allowed his conclusions to be refined and corrected. Organology as an academic discipline came into its own after the 19th-century development of large, permanent instrument collections in Europe and the USA. Once these repositories were established, organologists, who were often also museum curators, confronted the challenges of comprehensive classification and description. Curt Sachs's *Real-Lexikon der Musikinstrumente* (1913), a pioneering effort to systematize knowledge of instruments on a worldwide basis, and the widely-adopted classificatory scheme devised jointly by Sachs and Erich von Hornbostel were based on Victor-Charles Mahillon's research on instruments collected at the Brussels Conservatory beginning in the 1870s. Nicholas Bessaraboff, who in 1941 introduced the term 'organology' in the sense used here, applied a classification derived from Francis W. Galpin's (1910, 1937) to the collection at the Museum of Fine Arts, Boston. The study of instruments *per se* became an important resource for comparative musicology (e.g. Hornbostel's adducing of panpipe tunings as evidence of a cultural connection between Brazil and Polynesia), but ethnomusicologists have tended to subordinate a purely object-oriented approach to a broader consideration of instruments' musical and social contexts. Especially in traditional and non-literate cultures, the shapes, materials, and decoration of instruments, no less than their sounds, convey meaning essential to their functions; seeking to understand these features, organologists might collaborate in field research with ethnologists and native informants. Efforts to interpret ancient and prehistoric sound-producing implements have thus far usually proved inconclusive or unconvincing, in part because of the difficulty of faithfully reconstructing scattered fragmentary remains. Since primitive noisemakers often served multiple purposes, the sonic function of an excavated artefact might even go unrecognized.

Recent studies of Western instruments have produced important, though sometimes controversial, results in such matters as pitch and tuning, historically appropriate string materials and the origin and dissemination of various instrument types. Technological advances, for example, in dendrochronology (the comparative study of the annual growth rings in timber and in ancient trees in order to fix dates in the past) and computer-assisted tomography (the use of scanning techniques to obtain a detailed image of a particular section or plane, of or within a solid structure or body), have broadened the scope of organological investigation and helped raise standards of connoisseurship. During the last quarter of the 20th century, John Koster and G. Grant O'Brien contributed valuable new information concerning the

construction and uses of early stringed keyboard instruments, and Peter Williams explicated the obscure history of organs. Karel Moens raised fundamental questions about the authentication of antique bowed string instruments, while Herbert Heyde, a specialist in the development of woodwinds and brasses, demonstrated the relevance of geometric proportional schemes and local units of measure to instrument design. Studies such as these depend on close examination of extant instruments and primary documentary sources, including treatises, patent claims and musical compositions, as well as iconographic evidence. One striking conclusion to emerge from analysis of a wide range of data is that, contrary to common belief, major advances in instrument design often precede rather than result from musical style shifts, as innovative instrument makers, responding to general market conditions, introduce novel types having expressive potentials that might take generations for musicians to explore. The history of the piano and of the saxophone exemplify instances where, so to speak, the medium anticipated the message. Observations such as this demonstrate the power of organology to shift perceptions of music history.

Organo pleno [pieno] (It.: 'full organ'). Full organ has rarely, if ever, denoted that the composer has required the organist to draw every stop; since *c*1850 most composers other than French have left it to the organist's discretion and the organ-bellows' capacity.

Before that, both the term itself and the registration it indicated varied according to period and area. The 15th-century BLOCKWERK was itself the *plenum* of larger organs, from Spain to the Baltic, from Italy to the North Sea; if it were referred to in a document such as a contract, it would be called 'Principal'. When or where this Diapason chorus was separated into several single or multiple ranks, a term such as *grant jeu* would indicate the total or full organ (St Michel, Bordeaux, 1510), perhaps without flutes, like the 'compimento de l'organo' at S Martino, Bologna (1556). (*See* GRAND JEU.)

Plenum and the German terms *volles Werk* and *zum gantzen Werck* are chiefly 17th-century terms, referring to the Diapason chorus codified in many 16th-century sources; the last phrase, however, often means that a stop runs 'through the whole compass', not that it joins 'the total chorus'. In Italy *ripieno* was based on single ranks excluding Flutes (Antegnati, 1608), but later examples are known to have included a Tierce rank (Trent Cathedral, 1687), as sometimes happened with the PLEIN JEU in France (*c*1620). In Spain, *plé* (16th century) indicated the chorus in general, *lleno* (17th century) the main Mixture.

From *das Werck* at Hagenau in 1491, which was the total chorus Mixture excluding Diapason and Zimbel, to Mattheson's treatises of 1721, the German organ progressed towards heavier and thicker *plena*, including all stops except reeds, and used not so much for particular colour, like the French *grands* and *pleins jeux*, as for massive effects in preludes, toccatas, etc. Some writers, like Praetorius and Werckmeister, insisted that 'families' of stops should not be mixed. It is unlikely that J. S. Bach had a specific combination in mind when he asked for *organum plenum*, whether in 1715 or 1745; however, a contemporary organ builder, Gottfried Silbermann, directed organists to use the manual coupler but no manual reeds or Tierces in the *plenum* (Fraureuth, 1739).

PETER WILLIAMS

Organo tedesco (It.). *See* BARREL ORGAN.

Organ point. An ambiguous term in English, owing its existence to the fact that it is the literal equivalent of the Latin *punctus organi* or *organicus punctus*, the German *Orgelpunkt*, and the French *point d'orgue*. Although listed in all musical dictionaries, the English term is usually avoided in practical situations in favour of the more precise 'pedal' or PEDAL POINT and PAUSE or FERMATA. *Organicus punctus* is found as early as Franco of Cologne (*Ars cantus mensurabilis*, *c*1260), who used it for the penultimate note of a tenor at which the regular measure is suspended. Tinctoris (*Terminorum musicae diffinitorium*, *c*1472–3) applied it to the sign of the corona, which by that time was used in various situations where it was necessary for one part to pay attention to the other parts instead of to the beat: on final notes which must be prolonged and released together, in canons, where one part might have to prolong a final note until the other parts have caught up, and in passages of block chords where each note was to be prolonged for effect (e.g. Dufay's *Supremum est mortalibus*).

In French, *point d'orgue* was applied in the 17th century to both the corona and the harmonic pedal. The latter meaning, though rare, is found in Furetière's *Dictionnaire universel*, which was published in 1690 (though the reference is to the usage of the mid-17th century): 'Le point d'orgue est proprement une tenuë en Musique, et est en usage en plusieurs parties quand on veut que l'une continuë long-tems sur un même ton, tandis que les autres font différents accords'.

In the 18th century the term began to take on the additional meaning of the ornamental cadenza often demanded by the *point d'orgue*, whereas the meaning of harmonic pedal gradually dropped away. Cohen (*JAMS*, xxiv, 1971, 63–84, esp. 76) cited Etienne Loulié's use of the curious term *ostinatione* for pedal point in a manuscript composition treatise (before 1703). In 1844 the Escudier brothers (*Dictionnaire de musique théorique et historique*) defined *point d'orgue* simply as 'passage brillant que fait la partie principale dans un solo', while 19th-century treatises on fugue (e.g. Cherubini, Fétis)

introduced the term *pédale*, which they had doubtless imported from Italy, where it is found with its modern meaning as early as 1802 (Sabbatini). 20th-century French dictionaries distinguish sharply between *point d'orgue* and *pédale*; the former never means the latter.

Orgelpunkt seems to have entered German terminology by way of French usage rather than of Latin. Early German usage prefers 'Pausa generalis' or 'Corona' for the fermata, and it is under 'Corona' that Walther (*Musikalisches Lexikon*, 1732) gave his main definition – adding, however, that 'die Franzosen nennen es *point d'orgue*'. The other meaning of the French term crops up in Heinichen's explanation of a prolonged *tasto solo* note in figured bass (*Der General-Bass*, 1728), where he wrote that the French called it *point d'orgue* because one could hold a note with the pedals and play all sorts of 'variations and foreign syncopations' with both hands. By the mid-18th century the corona had come to be called *Fermate* (C.P.E. Bach and Quantz), and Marpurg was using *point d'orgue* for the pedal near the end of a fugue. By the end of the century *point d'orgue* had been taken over as *Orgelpunkt*, in which form it was defined by Sulzer (*Allgemeine Theorie*, 1771–4) and Koch (*Musikalisches Lexikon*, 1802) as a harmonic pedal, with no mention of the sign of the corona. Unfortunately, however, Koch gave *point d'orgue* as the French equivalent for *Orgelpunkt* – just when the French themselves had managed to differentiate it clearly from *pédale*. Thus began the confusion, which was made worse by English writers seizing upon the cognate without specifying which meaning they attached to it.

Modern French and German usage is clear: French *point d'orgue* means German *Fermate*; German *Orgelpunkt* means French *pédale*. English usage avoids 'organ point'; 'pause', 'fermata' and 'pedal' are preferred.

DAVID FULLER

Organ score. Most notably since *c*1750, when London publishers began issuing Handel's oratorios in two-stave reductions for solo organ, the term has denoted an abbreviated arrangement of a work for whose original instrumentation the organ stands as substitute. The practice grew in the 19th century, initially through the publications of Vincent Novello, which included organ scores of Haydn's masses. Previously, the term had two more important usages: (i) an open score (very often in four parts) of a piece of organ music, particularly of a serious or contrapuntal nature, from Bach's *Die Kunst der Fuge* to Frescobaldi's ricercares; (ii) an open score of a vocal or instrumental work accompanied by the organ which reproduces the sung parts. Organ-basses of the 1590s, and hence figured basso continuo parts of the next decade, are as it were shorthand organ scores, indicating harmonies rather than exact parts, though these were considered the ideal realization (Viadana, 1602). Banchieri (1607) recommended score or tablature even in works for which he supplied a so-called *basso seguente* part. Such organ scores as are literal in the sense of (ii) above became increasingly common from *c*1550 (Juan Bermudo, 1555) and serve as a church equivalent to the simple instrumental scores of contemporary secular music (e.g. Malvezzi's solo numbers in the *Intermedii* of 1591). The Italian term is PARTITURA, the German frequently *Tabulatura* (Scheidt, 1624; Klemme, 1631), not to be confused with *Orgeltabulatur*.

PETER WILLIAMS (with CHRISTOPHER KENT)

Organ stop (Fr. *jeu, registre*; Ger. *Register, Stimme*). A rank of organ pipes of a specific construction, colour or pitch; also sometimes used to refer to the knob or tablet controlling a specific rank of pipes. With regard to construction and tone-colour, organ stops fall into four basic 'families': principals or diapasons (the ranks of flue pipes that provide the basic 'organ tone'), flutes (flue pipes of various constructions but wider-scaled), strings (narrow-scaled flue pipes), and reeds (differing from the other three categories in that the sound is produced by a beating metal tongue). For a full discussion of pipework *see* ORGAN, §III. Compound stops (Mixture, Zimbel, Fourniture, Sesquialtera, etc.) consist of several higher-pitched ranks under a single control, usually 'breaking back' to lower pitches from the middle of the compass upward. Mutation stops are single higher-pitched ranks at 5th and 3rd pitches used to colour ensembles by reinforcing a particular harmonic; the more higher-pitched mutations also usually break back towards the top of their compass (*see* MUTATION STOP). Compound and mutation stops may belong to any of the three flue categories and are never used without a suitable foundation (i.e. a flue stop of 8′ pitch, occasionally 4′, 2′ or 16′).

Just as the term 'stop' is of uncertain origin and meaning, so the many stop names have a complex history and usage: the evolution of stop names naturally reflects the evolution of the organ as a complex instrument. During the 15th century in northern France, the Netherlands and the Rhineland, such terms as 'Principal' were used to indicate the basic sound of the organ, the *pleno* chorus; and the case pipes (Prestant, Montre, Doif, etc.) were increasingly specified in sources, they being the first ranks to be separated off from the chorus in a big church organ. In most cases large secular organs, which had a longer tradition for separate and sometimes highly colourful ranks, have no associated verbal descriptions that specify names. By 1500, builders were making many kinds of pipes and almost without exception giving them the names of instruments or sounds which they were thought to imitate (Trumpet, Horn, Recorder, Gemshorn, etc.), sometimes picturesquely so (Old Women's Voice, Nightingale). It is misleading to assume that the 19th-century liking for orchestral effects was in itself a sign of decadence in organ building, since the practice dates back to the Renaissance. The exceptions to these instrumental names were important, since they usually indicated the construction of pipes concerned and were thus intrinsic to the organ as an independent instrument (Gedackt, Hohlflöte, Spitzflöte, etc.). The origin of some stop names is particularly difficult to understand, including those that appear to be words taken from other contexts – musical (Diapason), architectural (Trompes), theoretical (Sesquialtera) or even onomatopoeic (Bourdon). In some cases, notably Trompes and Bourdons, it is not clear whether the use of the term in the organ context precedes any other. By the end of the 16th century, names in all countries and languages had become regular and reliable as indications of a stop's purpose, if not always of its tone; whether such names remained in the builder's contracts or were actually written on stop labels at the organ is less clear. Labels were hardly necessary, for instance, on Italian and English organs, and remained uncommon on chamber organs until the late 18th century.

The great organ theorists and those giving lists of specifications, such as Praetorius, Mattheson, Bédos de

Celles and Hopkins, gave a somewhat misleading impression of the uniformity and reliability of stop names. Readers of Praetorius, for instance, are led to believe not only that the names of the many Regal stops were neatly codified but also that such stops were more important – i.e. common over a wider area and for a longer time – than was indeed the case. Certainly written reports must always have increased the interest of organists and builders in new or foreign stops, particularly perhaps in those cases where writers expressed doubt as to the success of a certain builder in imitating such sounds as the human voice, sea waves, orchestral horn and so on. Few stops new in name, sound or construction originated during the 18th century, and many of those so popular in the 19th century (overblowing stops, string-scale flues) were known in some form in the 17th.

The definitions or descriptions that follow have been compiled with certain points in mind: (*a*) transliterations of stop names (e.g. Kwinta for Quinte) are not given, nor Nordic variants of German names (e.g. Spetsfloït for Spitzflöte) unless they indicate a different kind of stop (e.g. Baarpijp and Bärpfeife); (*b*) a short phrase indicates the family of stops which a name indicates, flue or reed, open, closed or semi-closed, metal or wood; two stops of the same name can have a different combination of such factors, as they can also serve quite different purposes from organ to organ (chorus/solo; principal/flute/mutation); (*c*) examples are taken from typical instruments, and no attempt has been made to list every maker's fanciful name or wayward invention; (*d*) examples may refer to a stop whose pipes are constructed in the manner normally associated with the name even when the builder's own term is unknown; (*e*) only a few names are included of those families of stops invented at different periods for purposes of little relevance to idiomatic organ music, particularly Renaissance and Baroque toy stops (birds, tinkling bells, etc.), late 18th-century free reeds of the harmonium type, late 19th-century high-pressure flue or valvular reed stops; (*f*) stop types with names in several languages (e.g. Querflöte, Flauto traverso) are entered under the most commonly used name unless a difference in construction is implied (e.g. Nachthorn, Cor de nuit).

Cross-references within this article are indicated in the form 'See under *Cornett*'; cross-references to other articles are in the usual form '*See* CORNETT'.

Aeolina, Aeoline. (1) A narrow metal flue stop of soft tone first found in Germany *c*1820, and still found in many modern organs.
(2) A free reed of gentle tone, invented *c*1815 (?by Eschenbach) and popular in central Germany (Schulze etc.).
(3) With free reeds with derived names: 'Claveoline' 8′ or 16′, sometimes with wooden resonators (by Beyer, *c*1820), 'Aeolodikon' 16′ (Walcker, *c*1840).

Baarpijp (Dut.). (1) Barem was a soft Gedackt stop during Praetorius's period (*c*1620).
(2) 'Baarpyp' at Haarlem (1735–8) and other Dutch organs of that period was a soft stop of tapered pipes. In earlier sources (from the late 16th century), often the same as Quintadena. The name may come from *baar* (Middle Dutch: 'bright') or *barem* ('to scream'), or from the German *Baar* ('pole' or 'rod'). But see under *Bärpfeife*.

Bajete, Bajón (Sp.). Late 17th-century Spanish reeds: a 4′ Bajete was gentle in tone, often a bass-half stop only, sometimes *en chamade* (projecting from the case front); Bajón was an 8′ Bassoon stop (the 4′ version called 'Bajoncillo'), stronger in tone, usually with flaring metal resonators. 'Bajoncillo y Clarín' was a single 4′ rank in two halves.

Bärpfeife (?Ger., ?Dut.). A reed stop of the mid-16th century (name first used by Niehoff ?*c*1540), the predecessor of Regal stops with fanciful resonators, strong in tone. The term probably has nothing to do with growling bears, however coarse the tone.

Bassflute. A 19th-century 8′ pedal stop, usually of stopped wood (like the 16′ Bourdon), sometimes open; 'Flötenbass' is an older German equivalent, of various constructions.

Basson (Fr.). See under *Fagotto*.

Bassoon. (1) An English reed stop of quiet tone, once found frequently from *c*1680 onwards (R. Harris), particularly on the CHAIR ORGAN; most examples probably had small-scaled flaring resonators.
(2) An English 19th-century reed stop, usually called Fagotto, of the same construction but at 16′ pitch on the Swell organ.
(3) A French 18th- and 19th-century reed stop (*Basson*), serving as the bass half to a treble Hautbois.
(4) On 19th-century English and American organs, the separately drawing bass octave of an Oboe or Hautboy.

Bauernflöte (Ger.: 'peasant's fife'). A penetrating 2′ or 1′ flue stop of open wide scale, sometimes stopped or as a Chimney Flute, found especially in the Brabant organ of *c*1550, the Fritzsche-Compenius organ of *c*1620 and organs of Saxony *c*1690; popular as a 1′ solo pedal stop for cantus firmus music.

Bazuin (Dut.). See under *Posaune*.

Bell Diapason (Fr. *flûte à pavillon*). Originating in France in the 1840s, it has cylindrical pipes with a flaring cone soldered at the top; a loud Flute.

Bell Gamba. A tapered flue stop of 16′ or 8′ with a short, conical section at the top of the pipes, found on 19th-century continental and American organs.

Bifara, Biffaro. (1) A double Flute whose pipes have a dividing wall and two mouths at different heights, producing a soft tremulant sound; it was popular in south Germany and Austria from *c*1660.
(2) In Walcker's organs (*c*1830) a double rank of 8′ stopped and 4′ open, producing a soft, string-like tone.

Blockflöte (Ger.). A wide conical metal flue stop imitating the recorder; it can be open, closed or overblowing (*c*1620), sometimes made of oak (late 17th-century Friesland and England), usually at 4′ pitch.

Blockwerk (Ger.; Dut. *blokwerk*). Not strictly a stop name, it denotes the undivided chest of the medieval organ based on a 'double Principal' without other 'stops' separated off. *See* BLOCKWERK.

Bocktremulant (Ger.). See under *Tremulant*.

Bombardon (Fr. *bombarde*; Ger. *Bombard, Pommer*). (1) In France, the basic manual or pedal 16′ reed, from at least 1587 (Arras), of importance to the larger French classical organs, with strong tone, metal or wood resonators and sometimes its own keyboard (Notre Dame, Paris, 1733).
(2) 'Pombarda', according to Praetorius, was a 16′ or 8′ reed of strong tone and two-thirds length resonators.
(3) 'Bombarda' signified long pedal reeds on the enlarged Italian organ of *c*1820 (Serassi).
(4) 'Bombardon' was the name given to a rather mild-toned English Bombarde of *c*1850.

Bourdon (Fr.). (1) The earliest 'Barduni' were low-compass bass pipes not always played by keys but sometimes held on as a drone by a kind of latch (Arnaut de Zwolle, *c*1440) (see under *Trompes*).
(2) Occasionally, 'Perduyn' or 'Pardoenen' indicated case-front pipes (*c*1550), more often inside pipes an octave below the case pipes.
(3) The most important use of the term was for the stopped pipes of either 16′ or 8′ pitch in the French organ from the 17th century onwards. The scaling was narrow to medium – stopped wood for lower octaves, stopped or chimneyed metal for the upper – and such stops had a broad musical application.
(4) A medium- to large-scale 16′ manual or pedal stop of stopped wood, often found in English and American organs from *c*1820 onwards.

Buzain (Dut.). See under *Posaune*.

Campanello (It.). (1) See under *Carillon*.
(2) A high repeating wide-scaled mutation, giving a bell-like effect (England, Germany, *c*1850).

Carillon. Various stops achieving bell-like effects. (1) Real bells of 4′ or 2′ pitch, played by hands or feet, on many organs, especially in central and south Germany from 1737–50 onwards; there were trackers to small striking hammers.
(2) A common Italian stop of the same type, popular in the early 19th century.
(3) A Dutch Tierce Mixture found *c*1750–1850 as a kind of Echo Cornet.

Celeste. See under *Unda maris* and *Voix céleste*.

Celestina. (1) A soft 4′ open wood Flute, sometimes found in English organs after the middle of the 19th century.
(2) In late 19th-century American organs, often a soft 4′ string.

Chalumeau (Fr.). (1) The same as Schalmei in some German sources of the 18th century.
(2) A small-scaled flaring reed stop in central Germany *c*1750, sometimes cylindrical.

Cheio (Port.). A chorus Mixture of the same type as Compuestas de lleno (Sp.).

Chimney Flute (Fr. *flûte à cheminée*; Ger. *Rohrflöte*; It. *flauto a camino*; Sp. *espigueta*). The name of an important pipe form known throughout Europe. The pipes are 'half-stopped', the metal canisters or stoppers pierced to allow a narrow tube to pass through. The length and width of the tube have varied from builder to builder. The resultant tone is very charming, the stopped Flute sound modified by several faint overtones. The pipe form probably originated in the Rhineland at the end of the 15th century; some early Netherlandish examples were called 'Hohlflöte' in the sources. Praetorius noted that such stops could be at 16′, 8′, 4′, 2′ and even 1′; Adlung (1768) added the mutations: $10\frac{2}{3}$′, $5\frac{1}{3}$′, $2\frac{2}{3}$′ and $1\frac{1}{3}$′. In France and Spain certain pipes (e.g. the lower octaves) in a Flute rank might be Chimney Flutes, as could a complete rank in Cornets; Mersenne (1636–7) noted that the length of tube affected the sound. Some early 20th-century builders, especially in the USA, made use of internal, inverted chimneys, thought to be more stable.

Chirimía (Sp.). A kind of 4′ or 2′ Schalmei, imitating the shawm in 17th- and 18th-century organs, sometimes *en chamade*.

Choralbass, *Choralflöte* (Ger.). An open metal or wood 4′ Flute found on the pedals of 17th- and 18th-century German organs for playing cantus firmus melodies; rarely an open manual 8′ Flute.

Cimbala (Sp.), *Cimball* (Eng.). See under *Zimbel*.

Clairon (Fr.). See under *Clarion*.

Clarabella. The early 19th-century English and American name for an open wood Flute (used by Bishop, *c*1825), often in the treble only, originally replacing an 18th-century mounted Cornet and useful for solos.

Claribel Flute, *Claribel*. A mid-19th-century name for a fairly strong Great organ 4′ Flute (Willis, *c*1860), sometimes harmonic for the top octave; it is also often found at 8′ pitch in late 19th- and early 20th-century English and Australian organs.

Clarín (Sp.). Spanish Trumpets of various kinds, originating mostly in the later 17th century. (1) An 8′ Clarín was a standard Trumpet, vertical inside the organ or horizontal at the case front. 'Real' Trumpets (Clarines, Trompetas) were usually vertical (not horizontal), the name indicating 'real' in the sense of 'full-length resonators'; but by *c*1750 'Trompeta Real' often meant 'royal trumpet'.
(2) 'Clarín de eco' was a smaller-scaled Trumpet in an Echo or Swell box.
(3) 'Clarín fuerte [suave]': a strong [soft] Trumpet. Both the strong and soft stops had flaring tin resonators.
(4) Clarines usually indicates a 2′ reed of soft Trumpet tone, sometimes a bass-half stop only.
(5) 'Clarín de batalla', 'Clarín de compaña': military-like Trumpet stops *en chamade*.

Clarinet. A reed stop of many different types and purposes. (1) Clarinette (little Clarín) was a Spanish Regal, sometimes *en chamade*, found in the heyday of Iberian organs (*c*1750).
(2) Clarinetto: an Italian Regal (18th century); or a German pedal Clarin 2′ stop (*c*1830) or 4′ (*c*1775).
(3) Clarinetto was occasionally a clarinet-imitating reed stop (*c*1790, south Germany).
(4) 'Clarinet', 'Clarionet' or 'Cremona' are names frequently found in English and American Choir organs from the early 19th century onwards. Having cylindrical resonators, such stops are related to the Cromorne [Krummhorn].

Clarino (It.). See under *Clarion*.

Clarion (Ger.; Fr. *clairon*; It. *clarino*). Reed stops. (1) A 4′ Clairon is a French chorus Trumpet, supplementary to the Trompette 8′, common on the main manual from at least *c*1580, and as such found elsewhere both in frenchified organs (England, Alsace) and those quite independent (central Germany).
(2) Clarino: a rare Italian Trumpet, of metal or wood; Trombetta and Clarone were other Italian terms used here and there from *c*1600.
(3) See under *Clarín*.

Claron (Sp.). A Nasardos or Tierce Mixture.

Compensationsmixtur. See under *Mixture*.

Compuestas (Sp.). A Mixture or Lleno, like the Fourniture but more varied in content.

Contra (Lat.). Used with the meaning 'an octave below': found especially in the latinized stop-lists of *c*1800. (1) Contrebasses were 19th-century French strong-toned pedal stops imitating the double bass (Cavaillé-Coll).
(2) Contrabass more generally indicates a (pedal) stop an octave below the open Principal.

(3) Contras are Spanish pedal ranks of open or stopped pipes, often without their own stop-knob; thus Contras en Bombardas denotes the 16′ pedal Bombarde.

Coppel, Koppel (Ger.; Lat. *copula*). (1) A coupler.
(2) A stopped 16′, 8′ or 4′ rank in eastern Europe, sometimes called 'Koppelflöte'. In many organs, the equivalent of the Gedackt, and made of metal or wood. However, some Koppelflötes, especially in modern organs, are cylindrical metal stops, having a cone-shaped top, and usually of 4′ pitch.
(3) Coppel elsewhere sometimes indicates a Gemshorn, Spillflöte or even Principal (*c*1540), probably so called because it was coupled to or drawn with Principals, Flutes or reeds.

Cor anglais (Fr.; It. *corno inglese*). 19th-century reed stop with narrow resonators shaped like the orchestral instrument (*c*1850); in Italy the stop is older (used by Serassi, *c*1820) and of coarser tone, and has wide, cylindrical resonators.

Cor de nuit (Fr.). An open or stopped flue rank of wide scale, at 8′, 4′ or 2′, found in French organs *c*1850 and in those in England and the USA that they influenced, where it is usually anglicized to 'Night Horn'.

Cornamusa (It.). A Regal toy stop once common (*c*1600) and producing the drone sound of two held reed pipes, thus leaving the hands free to play 'zampogna' or 'musette' music.

Cornet (Eng., Fr.; It. *cornetto, corneta*; Sp. *corneta*). Various stops imitating the CORNETT. (1) A very important French solo Mixture stop, one to three examples of which were found on every classical organ from 1650 to 1850; it was treble only, from *c*′, with five wide-scaled ranks (1.8.12.15.17) often placed on their own small chests ('mounted Cornet') from *c*1640. Examples during the second half of the 16th century were often given a distinguishing name, such as 'Cornetz à boucquin', 'Nachthorn', 'Cornet d'Allemagne', or stop 'imitating the zink'. The term is not to be confused with the organ stop Cornett, though sources are often unclear on this point. Also an important stop in 18th-century English organs.
(2) Cornetto and Corneta were Italian Flute mutation ranks, from *c*1680 – primo might be the Tierce, secondo the Nasard, terzo the Quarte de nasard, etc.
(3) Spanish Cornet stops ('Corneta clara', 'reale', 'tolosana', i.e. 'from Toulouse') were also common but not so stereotyped in pipe content.
(4) Cornets often had fewer ranks in the late 19th and early 20th centuries (two-rank Cornettin in Sweden), or were built up of string-scaled pipes (France, England, USA).

Cornett, Kornett (Ger.). A reed stop imitating the Zink or CORNETT, usually in the pedals, of 4′ or 2′ pitch, and found throughout central and northern Germany from 1600 to 1800. Praetorius noted that the flaring resonators are only just longer than those of the 'Trichterregal'. 'Singende Kornette' were so called partly because of the smooth tone, partly because such stops were used for melodic cantus firmus lines.

Corno (It.). A name found fairly frequently for various stops. (1) Italian Cornetto, a reed stop in old sources.
(2) Corno dolce is either a soft reed stop (built by Serassi, *c*1810) probably developed from Venetian Regals, or a wide Flute stop in Italy (*c*1750–1900), sometimes in the form of an inverted cone.
(3) Corno di bassetto, like the Corno inglese, is an imitative reed stop of the 19th century, with cylindrical resonators (used by Willis).

Corno inglese (It.). See under *Cor anglais*.

Cornopean. An English reed stop (Hill, Willis) imitating the *cornet à pistons*, of rather thin tone and 8′ pitch, found in Swell divisions after the middle of the 19th century.

Cremona. See under *Cromorne*.

Cromorne (Fr.; Ger. *Krummhorn*). Reed stops imitating the crumhorn; later versions of the name (Cormorne, Cremona) are corrupt. (1) German Krummhorn stops were of varied construction (Praetorius, 2/1619): they had metal or wood resonators and were open or stopped, short or half-length, cylindrical, double-cone-shaped, etc.
(2) French Cromornes appeared somewhat later, i.e. late in the 16th century, becoming the standard *Positiv* reed in the classical organ; usually they had medium-scaled, cylindrical, half-length, metal resonators. The tone was modified as builders in *c*1800 began to make it resemble the clarinet.
(3) English Cremona stops date from *c*1680 and presumably copied French models. They were fairly narrow in scale and appeared in English and American organs until superseded by the Clarinet in the mid-19th century.

Cymbal, Cymbale. See under *Zimbel*.

Decem, Decima (It.: 'tenth'). A mutation rank sounding the 10th or 17th; largely a theorist's term (Samber, 1704–7; Adlung, 1768).

Diapason (?Gk.). (1) Octave stops, sounding an octave above the case pipes, according to theorists (Werckmeister, 1705; Hess, 1774); found in organs with graecized stop names *c*1790.
(2) In England, the term may have denoted Trompes in *c*1500, but by 1613 it had its present meaning of Open Diapason (main Principal (or foundation) rank, usually 8′) and Stopped Diapason (Gedackt). As a term, 'Diapason' may be derived from Dutch Doif (*c*1450) and only later taking on a quasi-Greek form. As a registration direction 'Diapasons' is an indication to use the Stopped Diapason, whose mild but harmonically rich tone has a strong emphasis on the quint, to colour the Open Diapason. English builders prided themselves on their Diapason tone, Renatus Harris's examples (*c*1690) being already richer than those of his French models.

Diaphone. One of Hope-Jones's valvular reeds, useful in cinema organs. The construction was also adapted to create a powerful nautical fog signal, the 'fog horn'. *See* ORGAN, §III, 4.

Diez (Sp.: 'ten'). Hence 'Diez y novena' is the 19th or Larigot 1⅓′ (sometimes chorus Quint).

Doef, Doif, Doff, Doof (Dut.). Terms denoting the Principal stop in those early sources that used the word 'Prinzipal' to mean 'plenum' or main chorus, from *c*1450; e.g. 'le prestant ou doeuf' at Namur, 1598. Spellings are sometimes confusing, e.g. Praetorius's 'Doiflöte' is a Doppelflöte, not a Doef.

Dolcan (Ger.). See under *Tolkaan*.

Dolce (It.; Fr. *douce*). The verbal coincidence of Dolce, Dolcan, Dulciana and Dulzian has led to much confusion; probably all terms derive from Dulcis, a stop with 'sweet' tone. Dolce or Flauto dolce was

common for any soft stop from *c*1600 to 1800, whether wood or metal, and whether narrow and cylindrical or conical. Adlung gave other spellings and versions: Dulzfloit, Dolzflöte, Dulceflöt, Süssflöte.

Doppelflöte (Ger.). A fairly large-scaled Flute with two mouths, differing from the earlier *Bifara* in that it has no dividing wall. Late 19th-century German and American examples are of stopped wooden pipes with a powerful fundamental tone; the stoppers are occasionally bored.

Double. A prefix indicating pitch an octave lower than usual (Double Trumpet, Double Diapason).

Doublette (Fr.). The 2′ Principal rank of the French classical organ. The name was often used in the larger organs of the more cosmopolitan English builders of *c*1860, under the influence of Cavaillé-Coll's large 2′ ranks.

Douce (Fr.). See under *Dolce*.

Dulcian, *Dulciana*. Gentle flue stops of various form, found in the non-Latin countries of Europe from at least *c*1640, and in name deriving presumably from *dulcis* ('sweet'). Early examples in Austria and hence, through Snetzler, in England, were as likely to have been small-scaled Dolcan stops in the form of an inverted cone as the narrow, small-mouthed, miniature Diapason ranks familiar in most 19th-century organs, either as single ranks or in Mixtures. The earlier examples, especially *c*1725, seem mostly to have been at 4′, not 8′; by the mid-19th century, 16′ stops were also found in larger English organs, particularly on the Choir manual.

Dulzian (Ger.; Dut. *dulciaan*; Sp. *dulcayna*; Cz. *dulceon*). A reed stop of fairly gentle tone, with cylindrical resonators incorporating a conical foot, of 16′ (pedal, manual) or 8′ (secondary manuals), found in the Netherlands and north Germany. Early forms of the name were Touzyn, Toussein, Douseynen (*c*1510), showing a different origin from Dolcan–Tolkaan, despite Praetorius's confusion. Some Dulzians had fanciful resonators, some were similar to Cromornes. Iberian Dulcaynas were short conical reeds (*c*1740), often *en chamade* below the Trompetas, closer as an imitation of the medieval instrument DOLZAINA than the northern types.

Echo. (1) A small-scaled Cornet in many 18th-century German organs.

(2) A prefix indicating a soft colour-stop (Echo Flute, Echo Gamba, etc.) in 18th- and 19th-century organs throughout northern Europe.

English Horn. An imitative, double-belled reed stop, developed in the 1920s by the American builder Skinner; it is smoother in tone than the older Cor anglais, and different in construction.

Erzähler (Ger.: 'narrator'). A narrow, tapered flue stop of soft tone, developed by Skinner in the early 20th century and still popular with American organ builders; it is often accompanied by a Celeste rank.

Espigueta (Sp.). See under *Chimney Flute*.

Euphone. One of the free reeds invented *c*1820 and found on French and Italian organs, often with no resonators.

Faberton (?Ger.). Possibly a corruption of 'faburden', but apparently a stop producing a high, tinkling, bell-like tone, perhaps a Mixture (*c*1490), a high Principal rank (*c*1550) or a high, wide mutation stop (*c*1700).

Fagotto (Fr. *basson*; Dut., Ger. *Fagott*). (1) The German 16′ or 8′ Fagotto was a fairly soft-toned reed with long narrow resonators, from *c*1575 onwards; it could be open, stopped (Niedt, 2/1721), or fanciful in shape (Praetorius, 2/1619).

(2) 'Basson' by Bédos de Celles' period (*c*1775) was a French reed with short conical pipes, sometimes capped with a double cone.

(3) In Italy, a rare wooden Regal (*c*1675); in Spain, a short reed with half-length resonators, sometimes *en chamade*; in England, the name occurs only in the bigger organs *c*1860 for a narrow conical 16′ Swell reed.

Feldpfeife, *Feldtrompete* (Ger.). 'Feld' here means 'field' in the military sense. (1) A narrow, open flue stop of assertive Flute tone, usually at 2′ or 1′, found occasionally in 17th-century German organs.

(2) The German imitative Trumpet, not *en chamade* as in Spain but often held in the case vertically; others were interior Trumpets, all of a thin, strong tone.

Fernflöte (Ger.: 'far-away flute'). Found in a few English and American Echo organs, in imitation of the *Kronwerk* Flutes of south Germany *c*1750 or (more directly) their successors in the large organs of *c*1840.

Fiffaro (It.). See under *Bifara* and *Piffaro*.

Fifteenth. The Principal 2′ rank on English organs (any manual), so called from at least *c*1610, although early contracts qualify it as 'small principal'. *See also* SUPEROCTAVE.

Flachflöte (Ger.). Probably a corruption of 'flageolet-flute' rather than 'flat-flute' (i.e. one made of wide, shallow, wooden pipes). The name was used for several pipe forms: 8′, 4′ or 2′ conical pipes (Praetorius, 2/1619), perhaps like a Spillflöte (Zang, 1829), with strong, round tone.

Flageolet (Fr.). See under *Flachflöte*. (1) Also a name very common in 19th-century England (used by Willis) for a round, wide, rather discreet rank of metal 2′ pipes.

(2) French Flageolets of the early 17th century were usually 1′ or 1⅓′ ranks of open cylindrical pipes (see under *Larigot*).

Flautado (Sp.). The Principal or Diapason pipes, 32′, 16′ or 8′ (52, 26 and 13 *palmos*) in the organs of Spain, Roussillon, etc., from *c*1475. The name probably originated in Flauto, etc., but later became more specific: 'Flautado de violon', the Spanish Gedackt rank (usually of wood) in the 17th and 18th centuries; 'Flautadito', the 4′ Principal or Octave stop.

Flautino (It.). 19th-century name in Germany, England, USA, etc., for a soft 2′ open Flute.

Flauto (It.). See under *Flute*.

Flauto a camino (It.). See under *Chimney Flute*.

Flötenbass (Ger.) See under *Bassflute*.

Flute (Fr. *Flûte*; Ger. *flöte*; It. *flauto*). Originally a generic term for foundation stops (organ pipes other than the Mixtures) when the *Blockwerk* was divided into 'stops'; later a word applied throughout Europe to stopped or open pipes of 8′ or 4′ (as in 18th-century England) or to colour-stops with prefixes denoting shape (Spitzflöte, etc.), sound (Sifflöte, etc.) or function (Flûte majeur, etc.). Thus 'driifach fleiten' at Hagenau in 1491 indicated the three-rank Principal (8′ 8′ 4′); 'verdeckt floutwerk' indicated the Gedackts at the abbey church Einsiedeln in 1558; 'flauto coperto' indicated a stopped Flute rank (a Nasard 2⅔′) at Orvieto Cathedral in 1591;

and 'flauto reale' an open Flute rank in Venetian organs *c*1800. Other terms would indicate department ('flûte de pédale' was an 8′ or 4′ stop in the French classical organ, sometimes stopped, but usually an 8′ open metal stop of principal quality), construction ('flûte à fusée' was a Spitzflöte at Bordeaux, 1627), imitation ('flûte a neuf trous', the 16th-century French Recorder stop), compass ('dessus de flûte', a treble, open, imitative Flute stop of French organs *c*1740), etc. In addition, there were many attempts at imitating the recorder or transverse flute, usually specified in the name, e.g. 'Flauto allemano' or 'travesiera' in Spain, 'Querflöte' or 'flauto traverso' in Germany, 'flûte d'amour' in 18th- and 19th-century organs anywhere; on the other hand, 'Flet' was the usual eastern European name for stopped ranks of ordinary 4′ or 8′ Gedackt type. Some of the flute imitations were highly ingenious, involving overblowing (central Germany, *c*1610; France and England, *c*1850), fanciful construction or exotic woods (south Germany, *c*1725; southern Italy, *c*1725; the Netherlands, *c*1775), and in some cases with conduits leading the air under pressure to strike a flute-like lip in the pipe mouth (Westphalia and Spain, *c*1775, and some 19th-century orchestrions and 20th-century 'symphonic' organs. See also *Querflöte*).

Flute à cheminée (Fr.). See under *Chimney Flute*.

Flûte à pavillon (Fr.). Used *c*1850 for a large-scaled metal 8′ flue stop, whose cylindrical pipes are capped by inverted conical *pavillons*; found in some large organs *c*1875–1925. It is of wider scale and smoother tone than the similarly constructed *Bell Diapason*.

Flûte d'amour (Fr.). A mild 4′ Flute of wood, sometimes stopped, often found in American organs from the late 19th century onwards. It probably derives from the 18th-century central German *Flauto amabile*, usually a 4′ open flute.

Flûte harmonique (Fr.). The term was first used by Cavaillé-Coll, and hence his disciples in England and the USA, to describe the large-scaled, open, metal Flute rank of 8′ or 4′ pitch. A small hole is bored halfway along each pipe cylinder and the resulting 1st harmonic tone is strong. It is sometimes anglicized as 'Harmonic Flute'.

Flûte Triangulaire. Name given by E.M. Skinner to a softly voiced, three-sided, open, wood stop, usually at 8′ pitch. Stops of this type, although not so named, can be found at 4′ and 2′ pitch from the 1860s onward.

Fourniture (Fr.). The basic French Mixture stop, its name probably derived from the fact that in the 16th century, when the higher pitches were being separated from the foundations of the *Blockwerk*, it 'furnished' the higher pitches to the chorus; see also under *Mixture*. In the typical 18th-century organ, the Fourniture broke back only once in each octave, the Cymbale (see under *Zimbel*) twice. The term was also to be found in England in the organs of the French-influenced Renatus Harris (*c*1680 onwards), where, however, they frequently contained a Tierce rank, particularly by *c*1740.

French Horn. An imitative reed stop, made in England and the USA *c*1875–1950, often of high-pressure reeds with thick tongues; also occasionally found in 18th-century England, where the pipes took the form of a large-scaled, smoothly-voiced Trumpet.

Fugara. A term derived from Slav words for a shepherd's pipe (e.g. Polish *fujara*) and denoting a soft, rather slow-speaking string-toned stop of 8′ or 4′; first known in 17th-century Silesia, soon after in Bohemia, Austria, Switzerland, Swabia, etc. The pipes were usually long, narrow, cylindrical and metal, but slightly tapered forms were also known – both types reminiscent of the German Viola da gamba stop.

Gaitas (Sp.). A Regal with short resonators, imitating the bagpipe with its thin, nasal but quiet tone, known in Spain from *c*1600.

Gamba. See under *Viola da gamba* and *Geigen*.

Gedackt (Ger.). A rank of 'stopped' pipes, usually of wood; more specifically the Stopped Diapason of German organs, in Austria called Coppel, in France Bourdon, etc. In England the term was first used *c*1850 in connection with the narrow-scaled Lieblich Gedackt.

Geigen (Ger.). A 'string-toned' or narrow-scaled stop, usually of open metal pipes, found in central Germany *c*1620 and becoming indispensable in all national types of 19th-century organ. 'String-toned' is only a comparative or analogous term. The Geigen Diapason of the 19th century is a narrow-scaled Principal.

Gemshorn (Ger.). A sharply tapering, wide metal Flute stop, with a tone between that of flute and string (more towards the flute) and known from at least 1500 in the Rhineland, where it imitated the GEMSHORN. The shape and tone were more widely known than the name, and many mutation stops in France and Spain have pipes of this kind. 19th-century organs have narrower, more string-toned Gemshorn stops than the classic ranks of 16′, 8′, 4′, 2′, 5⅓′, 2⅔′ and 1⅓′ noted by Praetorius; the modern Gemshorn is almost always of 8′ or 4′ pitch.

Glockenspiel (Ger.). Usually a row of steel, copper or bronze bars hit by hammers activated by pedals or the keys of a secondary manual; in organs of 1720 (Swabia, Silesia, Saxony) of soprano or bass compass only, in organs of the 1920s often complete. See under *Carillon*. Some Glockenspiels were called 'Stahlspiel' ('steel instrument').

Gravissima (Lat.). A 64′ 'Acoustic Bass' stop whose tone was produced by a 32′ pipe sounding with a softer pipe of 21⅓′; made by several 19th-century builders (Schulze, Willis, Walcker).

Gross. A prefix generally indicating a stop of large scale (Grossflöte, Gross Gamba), but also applied to a mutation stop pitched an octave lower than usual (Gross Tierce).

Harfa, *Harfe*, *Harp*. (1) A Regal toy stop found on some 16th-century organs, probably giving a kind of bagpipe drone effect. Some complete Regal ranks of 16′ or 8′ were also so called, in central Germany (Harfenregal) *c*1620, Spain *c*1750, etc.

(2) A marimba-like percussion stop found in early 20th-century organs, especially residence and cinema organs.

Harmonia, *Harmonika*. Although these terms occasionally appear in early contracts, they were chiefly used by certain 19th-century builders for soft stops of various kinds: Harmonia aetheria, a soft Echo Mixture as in Schulze's instruments; Harmonika, a soft open flue stop of indeterminate tone (Walcker) or a free-reed stop (*c*1830).

Hautbois, *Hautboy*, *Oboe*. Like Cornet, Hautbois has indicated stops of several kinds over the centuries, all presumably imitating the instrument which itself changed and inspired builders in various ways. (1) In

early 16th-century French organs, Hautbois was probably a registration (i.e. Flutes and mutations), not a stop; by *c*1600 the stop called Hautboy-Cornet was probably a strong-toned reed stop.
(2) The French classical Hautbois originated as a soft *récit* Trompette, with small-scaled flaring metal resonators; called 'French Schalmei' by Mattheson, and found on most French organs and those they influenced elsewhere, notably England (Harris).
(3) In Germany, stops of this name had various constructions, from fanciful Regals to small-scaled Schalmeien.
(4) 19th-century attempts to imitate the tone varied from free reeds (*c*1840, France, central Germany) to the ubiquitous, ultimately French-inspired English Swell Oboe.

Hintersatz (Ger.). The ranks of pipes 'placed behind' the case pipes in the late medieval organ, thus one of the names of the Mixture of the *Blockwerk* remaining when the Prestants were separated off. Schlick (1511) assumed that it would contain at least 16–18 ranks. To some extent, the name remained as an occasional alternative for 'Mixtur'.

Hohlflöte, Hohlpfeife (Ger.; Dut. *holpijp*). (1) Rather wide, open, cylindrical metal pipes between Principal and Nachthorn in scale, found in organs of central and north Germany from *c*1500. The name is probably derived not from *hohl* ('hollow') but from *Holunder* ('elder-tree'; see under *Salicet*). Many German contracts of the 18th century confuse *Hol, Hohl* and *Holz* (wood) as stop-name prefixes, and the popular 19th-century stop can usually be assumed to be of wooden pipes.
(2) During the 16th century, the name in its various forms often indicated a stopped rank of wide scale (Rhineland, south Germany). In the Netherlands, it might be a Gedackt, Rohrflöte or even Quintatön, many 18th-century examples being simple stopped Flutes.

Horn, Hörnli (Ger.). (1) Several kinds of imitative reed stop (see under *French Horn*).
(2) Suffix for a group of stop names (Gemshorn, Nachthorn), like the related term 'Cornet' popular with 16th-century builders expanding organ colours.
(3) More specifically, the Hörnli was a 16th-century stop found in the upper and lower Rhineland, composed of the same ranks as stops elsewhere called Cornet and Sesquialtera, i.e. a solo (or solo and chorus) Tierce Mixture.
(4) Horn Diapason was a late 19th-century stop whose Diapason-scaled pipes had a vertical slot cut at the top and back, which influenced the tone.

Kalkant (Ger.). An accessory stop-lever found in Germany over the centuries, which when pulled caused a bell to ring and communicated with the bellows-blower. Similar devices were found in all countries until mechanical blowing was introduced in the late 18th century.

Keraulophon. A quasi-Greek term invented by Gray in *c*1820 to denote a stop type long known by other builders, i.e. a quiet, reedy-toned 8′ Flute stop. The pipes usually have a hole near the top.

Kinura. A keen-toned reed stop with very narrow, cylindrical resonators, often used in cinema organs.

Koppel (Ger.). See under *Coppel*.

Kornett (Ger.). See under *Cornett*.

Krummhorn. See under *Cromorne*.

Kuckuck (Ger.). See under *Vogelgesang*.

Kützialflöte (Ger.). An open Flute of 4′, 2′ or sometimes 1′ pitch, occasionally found on German organs from Praetorius onwards, evidently imitating a Slav instrument (*cewzial*: 'flute').

Larigot (Fr.). A term possibly derived from 'l'arigot' ('flageolet' – cf *haricot*) and used in the 16th century (and hence the later French classical organ in general) to denote the 1⅓′ wide mutation rank found in large and small organs and used for both chorus and solo registrations. Outside France, other terms like Superquinte, Quintanus and Flageolet were used.

Lieblich Gedackt (Ger.). (1) The 'pleasant stopped rank' known from at least Praetorius onwards to refer to the Stopped Diapason used for continuo playing or for soft (often echo) effects.
(2) More specifically, the smooth-toned Gedackt made popular by 19th-century builders (Walcker, Schulze, etc.), of metal or wood, with a high cut-up and characteristic tone. It is found at both 16′ and 8′ pitches.

Lleno. See under *Compuestas*; *Mixture*; *see also* FULL ORGAN.

Major, Minor. Terms denoting the size (rather than function) of a stop. Flöte major [minor] were common in 18th-century Habsburg Europe for 8′ and 4′ Gedackts; 'Majorbass' was fairly common in Germany between 1650 and 1900 for the 16′ or 32′ open or stopped pedal rank.

Melodia. A medium- to wide-scaled, open, wood Flute stop of 8′ pitch; the pipes usually have reversed mouths and sometimes sunken blocks. It was widely used in England and the USA from the middle of the 19th century.

Mixture (Fr. *fourniture*; Ger. *Mixtur*; Sp. *lleno*). Names for the collected ranks of the *Blockwerk* when the Principals and Flutes had been separated off. 'Mixture' was normally used to denote the Principal-scaled chorus Mixture as distinct from the high-pitched Zimbeln or the solo Cornets. The 'true Mixture' is often said to contain Octave and Quint ranks only, but Tierces have been found in many national types of Mixture (17th-century Spain, 18th-century England and central Germany), some of which were highly influential during the 19th century. Early names for the stop, which was presumably activated by levers, were 'Position', 'Locatio' and 'Starkwerk', all known before 1520; late types, introduced in some organs in the early and mid-19th century, were the 'Compensationsmixtur', which decreased in number of ranks, strength and volume as it ascended, and 'Progressio harmonica', which increased as it ascended. Mixture stops are never used without the foundations (8′, 4′, 2′, sometimes 16′).

Montre (Fr.). The case pipes of the French organ, corresponding to the English Open Diapason, the German Prestant, the Italian Principale, etc. Early alternative names were 'le principal de devant', 'devanture en monstre' (Reims Cathedral, 1570). The tone of the classical French Montre was somewhat more fluty than the various English Open Diapason types or German Principals.

Nachthorn (Ger.). A term possibly derived from *Nachhorn* or *Nachsatz*, i.e. a rank of pipes distinguished from the *Hintersatz*, and nothing to do with Cor de

nuit in origin. (1) Nachthornen were frequently the same as Cornets in the 16th century, more particularly in northern France and the Netherlands, cf the Spanish term Nasardos.

(2) By Praetorius's time, the name denoted a rank of very wide-scaled 4′ or 2′ pipes, stopped like the Quintatön and more horn-like than the Hohlflöte, owing to its Quint partial. The familiar 17th-century Nachthorn useful in the north German repertory was a very wide, metal, open Flute, used for cantus firmus in manual or pedal; a similar stop later appeared in English-speaking countries as 'Nighthorn'.

Nachtigall (Ger.). See under *Vogelgesang*.

Nasard (?Fr.; Ger. *Nasat*). Terms possibly derived from *Nachsatz*, i.e. the rank or ranks between the Principals and the *Hintersatz* of a separated *Blockwerk*. Early usages of the name refer to a registration or effect rather than a single rank of pipes (*c*1530, France), and *nazard* meant the rank helping to produce the characteristic sound, i.e. $2\frac{2}{3}'$ or $1\frac{1}{3}'$ Flutes. The form could be open or stopped, Chimney Flute or tapered. The French classical Nasard was usually a stopped rank of $2\frac{2}{3}'$, often a Rohrflöte for some or all its compass, that on the *Grand orgue* usually different in type from that of the *Positiv* manual. In Germany, there was frequently no distinction drawn in stop-lists between Quinte and Nasard, nor were the differences in form, volume, tone and function between the two so clear-cut as in France.

Nasardos (Sp.). A term probably derived from 16th-century French and Flemish usage to denote either the single mutation ranks (Octave, Quint or Tierce) making up the Corneta or, more importantly, the chorus/solo Mixture; a kind of bass version of the treble Corneta and found over the centuries on most Iberian organs.

Nason (?Eng.). A stopped Flute introduced to England at the end of the 17th century by Smith and copied by many builders for two centuries. It is very often of oak, with a characteristic sweet tone. The origins of its name are unclear.

Night Horn. In Anglo-American organs of the 18th and 19th centuries, usually a wide-scaled, 4′ open Flute. See under *Nachthorn*, *Cor de nuit*.

Nineteenth. The English term is meant to indicate the Principal-scaled $1\frac{1}{3}'$ rank, something more like the Italian Decimanona than the classical French Larigot.

Octave (Ger. *Oktave*; It. *ottava*; Sp. *octava*). (1) The 4′ Principal of an organ based on an 8′ Open Diapason, or 8′ of one based on a 16′ Diapason, etc. In England, 'Octave 4″ implies a strong Principal 4′ rank, such special meaning originating *c*1850.

(2) A prefix indicating pitch an octave higher than usual (Octave Flute).

Octavin (Fr.; It. *ottavino*). Open metal Flutes made by Venetian builders *c*1790 and Cavaillé-Coll *c*1860; often used in late 20th-century organs to denote a wide-scaled 2′ Principal.

Open Diapason. See under *Diapason* and *Principal*.

Ophicleide. Strong reed stop supposedly imitating the OPHICLEIDE and popular as a pedal rank in Willis organs.

Orchestral. A prefix denoting a stop of particularly imitative tone (Orchestral Oboe, Orchestral Flute), found in many early 20th-century organs.

Orlos (Sp.). An 8′ Regal with short cylindrical resonators, sometimes *en chamade* and common in Iberian organs by *c*1730.

Pauke, *Trommel* (Ger.; It. *timballo*; Sp. *tambor*). Drum stops were popular in the larger organs of all European countries until the early 19th century, and the percussion varieties in theatre organs *c*1920 were only revivals. Sometimes real timpani were provided, tunable and played by *putti* activated by pedal levers (Berlin, *c*1730), but more usually the many drum-effects were produced by two or more large-scaled wooden pipes out of tune with each other. Frequently the quasi-pitches produced were A and D, allowing realistic 'trumpet-and-drums' music: 'with trumpet, shawm or fife' according to the Trier Cathedral contract of 1537 (P. Briesger).

Philomela. An open, metal Flute of strong and fundamental tone, found in the Solo division of large Anglo-American organs in the late 19th and early 20th centuries.

Physharmonika. A free-reed stop with resonators introduced to Germany in the mid-19th century by builders such as Walcker and Ladegast and widely used for a time in large organs. It was also briefly popular in England and the USA.

Piccolo. A 19th-century 2′ or 1′ Flute stop made by English builders to a design labelled Octavin, Flöte, Flageolet, etc., by other builders; pipes are sometimes of harmonic (double) length.

Pífano (Sp.). Open or stopped Flute 4′ or 2′; the name was used over the centuries and was possibly a corruption of Pfeife or Piffaro.

Piffaro, *Fiffaro* (It.). Although in other musical contexts Fiffaro often denoted a reed instrument, organ stops of this name fall into two different classes. (1) An open Flute found in Rhineland organs of the 16th century, high-pitched and later overblowing or double-mouthed, producing a tone imitative of the cross-blown fife.

(2) An important Italian stop of the 16th century onwards; it had treble compass Principal-scaled pipes mistuned with the Principale 8′ and thus producing an undulating effect, more singing and less reedy than 19th-century *céleste* stops. It was sometimes called Voce umana. See under *Voce umana*.

Pommer (Ger.). See under *Bombardon*.

Portunal (*Portunalflöte*) (Ger.). A term, probably a corruption of Bourdon, denoting in 17th- and 18th-century German organs a rank of 8′ or 4′ open, wood or metal pipes (sometimes in the form of an inverted cone), producing a modified Open Flute colour.

Posaune (Ger.; Dut. *bazuin*, *buzain*). A common name for 16′ or 32′ pedal reed stops of varied construction in certain areas and periods. Resonators two-thirds long were generally considered desirable, but they could be of wood or metal. The 'stille Posaune' seems, from Praetorius, to have been a stopped reed, but many builders used 'Posaune' in general for their big reed other than the Bombarde, from at least *c*1580 onwards.

Praestant (Lat.; Fr., Ger. *Prestant*). Pipes 'standing in the front' of the organ case. (1) In the Netherlands, since 'Principal' denoted the main chorus as a whole in *c*1525, 'Praestant' was used to refer to the case pipes or Open Diapason itself. German builders *c*1550–1800

used Praestant and Principal as synonyms, depending on local custom.

(2) In France, 'Prestant' soon came to denote the 4′ Principal rank distinct from the Montre 8′, as 'Principal' in England has always indicated the 4′ Principal rank distinct from the Open Diapason 8′; both French and English usage was established by 1600.

Principal (Ger. *Prinzipal*). See also under *Praestant*. The term first arose soon after 1500 in the Netherlands (and hence probably in England) to denote not a single rank of pipes but the Diapason chorus as a whole, i.e. the undivided Mixture or *pleno*; in English and American organs from the 18th century onwards, however, it usually denotes a 4′ stop. By Praetorius's time, the 'stop formerly called Praestant or Doeff' was called Prinzipal in Germany. In the 20th century, Prinzipal has become useful as a term denoting the relatively colourless German basic 8′ rank as opposed to the French Montre or the various English Diapason tones.

Quartane. In the 20th century this term has been used as a substitute for Quarte de nasard. See under *Rauschpfeife*.

Quarte de nasard (Fr.). The stop a 4th above the Nasard on the French classical organ, i.e. a 2′ Flute mutation rank rather than the chorus Doublette. Usually open, the bass octave was sometimes a Chimney Flute.

Querflöte (Ger.). The transverse flute has been imitated in various ways. The organ stop so called is properly an open cylindrical metal or wood stop, usually 4′, overblowing to the 1st or 2nd overtone because of the narrow scale and small mouth; a small hole halfway along the pipe facilitates the overblowing (cf Cavaillé-Coll's Flûte harmonique). Such overblowing Schweizerpfeifen seem to have been known in late 15th-century south Germany. Construction can vary: stopped and wide-scaled (Praetorius, 2/1619); long, narrow pipes overblowing at the 12th (Compenius, Fritzsche); conical (Snetzler); 'blown from the side' (Wagner); simple, stopped 2′ Flutes (*c*1600); fanciful, large-scale pipes (*c*1840), perhaps of turned hardwood (*c*1730).

Quint. Like Nineteenth, Fifteenth, etc., Quint has usually since about 1550 indicated chorus ranks (not Flute mutations) sounding $10\frac{2}{3}'$, $5\frac{1}{3}'$, $2\frac{2}{3}'$ and $1\frac{1}{3}'$. *See also* QUINT (iii).

Quintadecima (It.). The Fifteenth or 2′ Principal chorus rank, sometimes perhaps doubled or paired in Italian organs before *c*1500.

Quintadena, Quintatön (Ger.). A stop of narrow-scaled, stopped, metal pipes, often of a high tin content, producing a quiet tone with a marked 5th (i.e. 2nd overtone) in it; the pipes are near overblowing. Like other basic organ-pipe shapes, it was known by 1500 and more commonly used throughout Europe than the name itself. The origin of the term is uncertain, all the variants (e.g. Quintade, Quintaden, Quintiten) suggesting the '5th-tone' nature of the sound. Schällenpfeifen ('bell-pipes', referring to the tone) was an early 16th-century alternative name; a Gedacktpommer was a strong-voiced 4′ Quintatön in the 17th century. Many types of Stopped Diapason before *c*1775 have much of the tonal quality of a Quintadena, but with more fundamental.

Rankett, Rackett (Ger.). A 16′ Regal with short resonators and gentle tone, found fairly often from the end of the 16th century in northern Europe, particularly in small organs and the secondary manuals of large ones. Shape and materials varied, but the pipes were always short. Such Regals were entirely out of fashion after 1710, but have been revived in the late 20th century.

Rauschpfeife, Rauschquint, Rauschwerk (Ger.). Words of doubtful origin – probably unconnected with *rauschen* ('to murmur') – properly denoting three distinct kinds of chorus Mixture in the various German organ types from *c*1575. (1) Rauschpfeife of two ranks (15.19 or 2′ + $1\frac{1}{3}'$); other additional ranks would be the 12th and 22nd.

(2) Rauschquinte of two ranks (12.15 or $2\frac{2}{3}'$ + 2′), otherwise called Quartane. Neither term was used reliably by builders until recently.

(3) Rauschwerk is frequently used to replace one or other term; but for early sources (e.g. Schlick, 1511), 'Rauschwerk' was a term denoting either a semi-Flute solo compound stop imitating a reed instrument, or a reed stop itself or a collective term for reeds, probably of more refined tone than the Trompete. 'Rauschende Zimbel' (Russzimbel, etc.) seems to be an early term for high Mixtures.

Recorder. In England, the term appears in a few 17th-century contracts to refer to a Flute stop, probably of 4′ pitch ('unison to the Principall': York Minster, 1632). It could be a stopped metal rank (Worcester Cathedral, 1613) or of wood (St John's College, Cambridge, 1635), and both forms are encountered up to the beginning of the 18th century.

Regal. A term of uncertain origin (*see* REGALS) denoting a family of reed stops probably descending from the late medieval instrument; the small or very small resonators made such ranks useful in the subsidiary chests of larger organs. Early 16th-century names were frequently specific, at other times more cumbersome, such as 'Regal to make the human voice' (Vox humana). Fanciful names and pipe forms were found chiefly in northern Germany from *c*1575 to *c*1700 and should not be overestimated: Apfelregal (short resonators with a little round perforated ball at the end), Geigenregal (delicate 4′ Regal, treble sounding as a violin when drawn with a Quintatön, according to Praetorius), Harfenregal, Jungfernregal (thin tone 'like a girl's voice'), Knopfregal and Kopfregal ('knob-' and 'head-shaped Regal'), Messingregal (short brass pipes), Singendregal ('singing Regal' of light tone, useful for cantus firmus melodies), Trichterregal (important type with 'funnel-shaped' or conical resonators like small trumpets). In other countries, Regals usually had freer names, e.g. Orlos, Tromboncini, Vox humana; this was true everywhere after the 17th century.

Repeating. When applied to a mixture or mutation, this term indicates that the entire compass of the stop consists of a repetition of the same octave (or half-octave) of pitches.

Resimbala (Port.). See under *Zimbel*.

Ripieno (It.). (1) The full chorus, i.e. either a registration of drawn stops or the *Blockwerk* itself.

(2) The classical Italian chorus Mixture, after single ranks became less the norm on the Italian organ than they had once been (*c*1800).

Rohrflöte (Ger.). See under *Chimney Flute*.

Rosignolo, Rusignolo, Rossignol. See under *Vogelgesang*.

Sackbut. A term occasionally used in various periods for big reed stops.

Salicet, Salicional. A term derived from Latin *salix* ('willow tree') during the later 16th century to denote a rank of open cylindrical pipes of narrow (sometimes conical) scale giving a fairly delicate, almost string-like tone. The most common pitch may have been 4′, as it was for the early Dulciana. The stop was a speciality of eastern Europe, and it became very popular in the 19th century at both 8′ and 4′ (Salicet) pitches). The small mouths made side ears advisable. In central Germany around 1725, 'Sollicinal' was a two-rank Sesquialtera.

Schalmei (Ger.). (1) From *c*1550, a short-length reed stop with narrow, flaring resonators giving it a tone closer to a smooth trumpet than a real shawm. The tone must have varied over the centuries, but the stop seems to have been particularly associated with cantus firmus playing. It was rare from 1750 to 1930.
(2) In some central European sources of *c*1775, Schalmei seems to have been an auxiliary 8′ flue stop.

Scharf (Ger.; Dut. *scherp*). Narrow-scale chorus Mixture of 'sharp' penetrating tone, found throughout northern Europe from *c*1500 onwards. (1) Early Dutch and German Scharf Mixtures were high-pitched like the Zimbel, and properly distinct from the Terzzimbel.
(2) The basic Mixture of subsidiary manuals was often called Scharf whether or not it was Zimbel-like. Those of the mid-19th century frequently contained a high Tierce rank.

Schnarrwerk (Ger.). 17th-century term for the 'rattling stops' or Regals, but not used to designate a specific stop.

Schwebung (Ger.). An undulating stop composed of two slightly detuned ranks of pipes; it is usually called 'Celeste' in English and French. *See also* TREMULANT.

Schwegel, Schweigel (Ger.). A term derived from the High German *suegela* ('flute') to denote a delicate Flute stop of fairly narrow scale, common in south and central Germany from 1550 to 1850, chiefly on subsidiary manuals. Some 'Schwegli' were $1\frac{1}{3}'$, others 4′, 2′ and even 8′ (the last especially *c*1750); some open, wide pipes, others conical, yet others in the form of a double cone or overblowing. 19th-century Schwegels are usually wide Flutes.

Schweizerpfeife (Ger.). To play a flute 'in the Swiss manner' in early 16th-century sources meant to play it cross-blown, like a fife. (1) Organ imitations of the period took various forms (see under *Querflöte* and *Flute*).
(2) In the 18th century, the name often denoted an 8′ or 4′ rank, in the form of an inverted cone or narrow and cylindrical, either way resembling the so-called Viola da gamba in tone.

Sedecima (?It.). A term found in eastern Europe of the 17th and 18th centuries to denote a $1\frac{1}{3}'$ Sifflöte.

Septième (Fr.). Cavaillé-Coll's name (hence that used by English builders) for the 'Seventh' or $4\frac{4}{7}'$, $2\frac{2}{7}'$ and $1\frac{1}{7}'$ mutation series, first known as an idea in Prussia *c*1780 but coming into prominence as an extra colour in a large organ of *c*1860, and as a sharply colourful rank in the *Oberwerk* of a neo-Baroque organ of *c*1950, particularly in Germany.

Seraphon. Weigle's name for a group of high-pressure flue and reed stops popular in Germany during the early 20th century.

Sesquialtera. A term perhaps derived from the Latin sesquialtera ('one and a half') and used to denote a two-rank solo/chorus mutation stop containing the 12th and 17th ($2\frac{2}{3}' + 1\frac{3}{5}'$), written carelessly as 'Quinte 3′ + Terz 2′ = 3:2 = $1\frac{1}{2}'$'. Other forms of the name suggest clever etymologies: 'Sexquialter' (England, late 18th century) apparently referring to the 6th contained between the $2\frac{2}{3}'$ and $1\frac{3}{5}'$ pipe. 'Sex quintaltra' and 'Sexquintalter' (ditto), 'Flautt in 6ta' (Italy, late 17th century), etc. F. Hocque's phrase 'Sesquialtera called by some Vox humana or Nasard', for what was in fact a Cornet stop (Trier Cathedral, 1590), shows the interdependence of names at that period. (1) The classic two-rank Sesquialtera was a flute-like semi-Cornet solo stop, often treble only, found in north-west German organs of *c*1630–1790.
(2) The English Sesquialtera was, during the late 17th century, a bass complement to the treble Cornet stop; during the 18th century a complete chorus Mixture including a narrow-scaled Tierce rank; and during much of the 19th century often the only Mixture (still with a Tierce) in the whole organ.

Seventeenth. See under *Tierce.*

Sifflöte (Ger.). A term probably derived from *siffler*, 'to whistle', although many German spellings suggest a wider derivation: cyvelet (Amsterdam, Oude Kerk, 1539 – cf zuffolo: 'shepherd's fife'), Sufflet (Dresden, 1563), Schufflet (Münster, 1579), Suff Flöte (by Christoph Donati, 1683), Suiflöt/Duiflot and Subflöte (Praetorius, 2/1619). (1) A high-pitched Flute stop, narrow, wide or conical; good examples have a characteristic sibilant tone.
(2) Throughout its period of popularity, the stop could be either 1′ or $1\frac{1}{3}'$, some builders (e.g. G. Silbermann) preferring the first, others (e.g. Schnitger) the second. Much the same was true of the Sedecima, the Sifflöte of eastern European countries.

Sordun. A very short stopped Regal imitating a woodwind instrument, soft (cf sordino) and somewhat thin in tone, popular during the 17th century in north central Germany.

Soubasse (Fr.). See under *Sub-Bass.*

Souffleur (Fr.). See under *Kalkant.*

Sperrventil (Ger.). The 'blocking valve' for preventing wind reaching a chest, saving it for other chests or keeping it from sounding a ciphering note. Such valves were the first means of dividing the *Blockwerk* in some instances; they remained a common accessory in northern Europe until *c*1850. During the 19th century, the valve's potential as a registration aid was exploited by such builders as Cavaillé-Coll who (like certain 17th-century builders) made several chests for each department or manual, each of which could have prepared stops that would sound only when the valve was activated.

Spillflöte (Ger.). Probably a corruption of 'spindleflute', a rank of open, wide cylindrical pipes which suddenly taper towards the top. The pipe form could be used for an 8′, 4′ or 2′ stop (north Germany, 17th century) or for part of a mutation rank (various countries) of discreet tone.

Spitzflöte (Ger.). The 'pointed flute' stop whose pipe form – gently tapering or conical from mouth to top – was more common than the occurences of its name suggest, especially outside Germany, the Netherlands and Scandinavia. The taper is more pronounced than that of the Gemshorn, and the tone is that of a reedy or breathy flute, good for blending either at 8′ pitch or as a mutation. Such pipe forms are known from the late 15th century (8′ at Lübeck Totentanzorgel, 1492) and frequently had a part in a French mutation rank, a Spanish Corneta or an Italian Flauto; the name itself appears to be late 16th-century. 19th-century examples in Germany and England tend to be more string-like in tone.

Stentorphone. One of Weigle's late 19th-century open flue stops of very loud tone, popular in larger German and American organs *c*1890–1920.

Stopped Diapason. Unique to Britain and its colonies until the late 19th century, this medium-scaled, low cut-up, thin-walled, stopped wood stop has a mild, blending colour, quite distinct from that of the German Gedackt or French Bourdon. See also under *Diapason* and *Gedackt*.

Suavial, Suabe Flöte (?Ger.). A term probably derived from *suavis* ('sweet'; not from Swabia, 'schwäbisch') and used to denote a narrow-scaled 8′ or 4′ metal stop popular in southern Germany, Switzerland and the Habsburg countries from *c*1710 to the 19th century. Burney described one in Frankfurt as 'meant for that sweet stop in Mr Snetzler's organs which he calls the Dulciana'.

Sub-Bass (Ger.; Fr. *soubasse*). An unspecific term that usually denoted a stopped wooden rank of 16′ pedal pipes of average scale. During the 19th century, some German and French builders used it for the 32′ Bourdon rank.

Superoctave. See under *Fifteenth*; *see also* SUPEROCTAVE.

Tambor. See under *Pauke*.

Tapada, Tapadillo (Sp.; It. *tappato*). Prefix denoting 'stopped' pipes. Tapadillo was the Spanish 4′ Flute of the 17th and 18th centuries, usually stopped but on occasion open, and either conical or a Rohrflöte.

Tenori (It.). An occasional 16th-century name for the Principal 8′.

Tenoroon (?Eng.). The name applied in some early 19th-century sources to describe a flue or reed stop, usually of 16′ pitch, and generally going no lower than C.

Terpodion. A quasi-Greek name for delicate stops of 'delightful' tone in early 19th-century German organs.
(1) A free reed (*c*1830).
(2) A small-scaled, open, metal flue (Schulze).

Tertian, Terzian (Ger.). Properly a two-rank solo and chorus Tierce Mixture, found more especially in northern Europe during the 17th and 18th centuries and consisting of the ranks 17.19 ($1\frac{3}{5}'$ + $1\frac{1}{3}'$) as opposed to the 12.17 of the Sesquialtera. Theorists have pointed out that it could contain 15.17 ranks (Werckmeister, 1705) or 10.12 (Adlung, 1768), and many examples did break back an octave around *c*′. The scaling was somewhat wider than Principal.

Terza mano (It.). The 'third hand' or octave coupler found on late 18th-century and 19th-century Italian organs, feasible in view of the often long compass of the main manuals.

Terzzimbel. See under *Zimbel*.

Theorbe (Ger.; Sp. *tiorba*). (1) German reed stop of the 17th and 18th centuries, rare but of a distinct type, i.e. gentle 16′ tone imitating, in some way, the theorbo.
(2) More familiar Spanish reed with short resonators, often *en chamade*, *c*1750.

Tibia (Lat.). General name for 'pipe', used in the Latinate contracts of the late 18th century and by the technician-inventors of the late 19th century. Thus Tibia angusta is a narrow Flute, Tibia clausa a Gedackt, 'cuspida' a Spitzflöte, 'sylvestris' a Waldflöte, etc. In 20th-century cinema organs it is a loud, wide-scaled Principal.

Tierce (Fr.; Ger. *Terz, Tertia*). The $1\frac{3}{5}'$ Flute mutation rank, more particularly of the French classical organ. Such third-sounding ranks were contained in Arnaut de Zwolle's Cymbale of *c*1440, but evidently their scaling widened over the centuries, achieving a characteristic horn tone by 1750. Some Parisian organs *c*1630 had two such ranks, one wide the other narrow, the latter thus used in one or other *pleno*. The Double Tierce $3\frac{1}{5}'$ (Grosse Tierce) was first known *c*1660 and contributed to the array of melodic colours in French organ music. Outside France the stop was found as a single mutation rank only in organ types influenced by the French, e.g. those of the Rhineland, Saxony and England. Besides French terms, 18th-century names for it were Ditonus, Decima, Sixtil (all in various northern European countries) and Corneta (Italy).

Tiratutti (It.). A mechanical device known in 18th-century Italian organs whereby the organist could 'draw all the pleno ranks' at once.

Tolkaan (Dut.; Ger. *Dolcan*). A term of uncertain origin denoting a rank of open inverted conical metal or wood pipes, often confused with Dulzian, Dulciana, etc. As in other instances, the pipe form was known in more versions and over greater areas than the name itself. The Tolkaan was a speciality of large Dutch and Hanseatic organs of *c*1580, as was the Trichterflöte ('funnel-shaped flute') early in the next century. The pipe form was also found in the case of Spanish flutes, Austrian Dulcianas, Neapolitan Voci umani (all of *c*1750) and many soft or fairly soft colour-stops in German organs *c*1825.

Tremulant (Fr. *tremblant*; It. *tremolo*; Sp. *temblor*). An important accessory stop contained in most larger European organs from *c*1500 to the present day, although not always specified in the contract; *see* TREMULANT.

Trichterregal. See under *Regal*.

Trombone. See under *Posaune*.

Tromboni, Tromboncini (It.). (1) A 'small-large trumpet' reed stop introduced now and then into Italy by various Flemish or German builders.
(2) Tromboni were long and strong-toned 16′ or 8′ reed stops on many national types of organ *c*1820.
(3) Tromboncini were an important type of Regal on Venetian and Tuscan organs of the late 18th century, with very small-scaled square-sectioned metal resonators standing in front of the case pipes.

Trommel (Ger.). See under *Pauke*.

Trommet, Trompete, Trompette. See under *Trumpet*.

Trompes (Fr.). The large open bass pipes placed apart from, and on either side of, the *Grand orgue* of many large French and Dutch organs of the later 15th century. A set of ten was fairly common. Other names (e.g. *turres* at Angers Cathedral in 1416) are also

sometimes found; 'trompe' may signify the 'pendentive', or carved, wooden, semicircular console on which the pipes were placed.

Trumpet (Ger. *Trommet*, *Trompete*; Fr. *trompette*; etc.). A very familiar imitative reed stop with long resonators either flaring or in the form of an inverted cone, of metal or wood, found in most organ types since *c*1500 and taking various forms. (Organs without a Trumpet were the classical Italian organ of *c*1600, the English pre-Restoration organ, and the mature eastern European organ of the 18th century.) The resonators should be about two-thirds long (6′ for 8′ C). German and English Trumpets from 1650 varied from builder to builder; 17th-century German Trumpets were often short, especially if the flaring was marked and the pipes placed vertically in the case front. 18th-century French Trumpets developed great power and attack, especially in the bass, often using wider tongues and bigger resonators. Spanish Trumpets also followed certain conventions: the Trompeta real was a full-size vertical reed within the organ; Trompeta bastarda had shorter resonators, often *en chamade*; the Trompeta magna, Trompeta de batalla and Trompeta imperial were horizontal Trumpets, often of suboctave pitches (16′, even 32′, in the treble). During the late 19th century, exceptional organs in any city of Europe might have had highly imitative Trumpet stops, with higher pressures, perhaps brass resonators, arranged as a fan or *en chamade*, etc.

Tuba. Except in the Latinate contracts of *c*1800, 'Tuba' as a stop name is found almost entirely in the 19th and 20th centuries, and denotes a louder reed stop than the usual Trumpet, taking whatever form the builder found useful for increasing volume. The Tuba Mirabilis was an unusually loud Tuba, often on a separate chest.

Twelfth. The rank of $2\frac{2}{3}$′ open metal pipes forming part of the Diapason chorus. Some early Twelfths, however, were more Nasard-like, especially in England *c*1725.

Twenty-second (It. *Vigesimaseconda*). A Principal stop of 1′ pitch.

Uccelli (It.). See under *Vogelgesang*.

Unda maris (Lat.). A term applied in south and central Germany during the 18th century – and hence through Walcker (*c*1830) to most major builders of the 19th century – to denote a rank of narrow, open 8′ metal pipes, tuned slightly sharp or flat (either to a second rank standing with it or to the organ as a whole) and so producing an undulating effect. In some 18th-century central German organs it was a double-mouthed pipe with an internal divider (see under *Bifara*). The effect was known more widely than the name, being mentioned by Mersenne (1636–7), found in the classical Italian organ as Piffaro, and impressing the many 18th- and early 19th-century builders looking for colourful Flute and string stop varieties.

Untersatz (Ger.). The term for pipes placed on a chest below (and at the back of) the main chest of organs in north and central Germany *c*1575–1825, i.e. pipes of the larger pedal stops. In practice, the term thus denotes various 16′ or 32′ pedal stops, particularly stopped wood 32′ ranks.

Viejas (Sp.). The 'old women's voice', or thin Vox humana of Spanish organs *c*1750, often *en chamade*. Other fanciful names for particularly thin Vox humana stops were Viejos (Spain, *c*1750), Jungfernregal (Germany, *c*1625) and Vox pueri/tauri (Italy, *c*1600).

Viola da gamba. The name for a large number of stop-types whose only common characteristic is their claiming to imitate the string instrument. (1) In *c*1620, often a Tolkaan.

(2) During the 17th century in central Europe as a whole, many narrow cylindrical stops bore the name Viola da gamba or Viol d'amour as well as Salizional, Dulciana, etc.

(3) Many Gamba stops contained conical pipes, like narrow Spitzflöten – Saxony *c*1725, England and south Germany *c*1850, northern Italy *c*1800.

(4) Many Gamba stops of the 18th century are either very flute-like (south Germany) or soft stops of sweet, breathy Diapason tone (G. Silbermann), but 19th-century examples are often stronger in tone.

(5) In Italy and Spain from *c*1750, 'Viola' often denoted a regal stop of one or other kind.

Vigesimaseconda (It.). See under *Twenty-second*.

Viola pomposa. A broad and fairly strong string-toned stop, developed by G.D. Harrison in the 1930s, and used since in American organs.

Viole d'orchestre. A very narrow-scaled, keen-sounding string stop, found mostly in organs built in the first half of the 20th century.

Violetta (It.; Sp. *violeta*). (1) Regal stops, with very small, open, conical resonators of 4′ or 2′, made in the late 18th century.

(2) Miscellaneous string-toned flue stops, 8′, 4′ or 2′, on various of the later 19th-century organ types.

Violina. A medium-scaled 4′ stop of string tone, frequently found in the Swell division of 19th-century English and American organs.

Violón (Sp.; Ger. *Violon*). (1) In Spain, an important term for the Stopped Diapason on the Baroque organ, manual or pedal. Thus 'Flautado violón' was the Bourdon.

(2) A common German open, wood, pedal stop of medium volume and nondescript tone, found during the 18th and 19th centuries. Often a substitute for the Prinzipal 16′.

Violoncello (It.). (1) A Venetian regal stop at 8′, with small rectangular cross-section resonators of boxwood or pine, placed vertically in front of the case pipes, and in use from *c*1750 onwards.

(2) Narrow flue stops of various periods and areas in Germany, *c*1700–1900.

(3) An 8′ pedal stop frequently found in 19th- and 20th-century English and American organs.

Voce umana (It.). A very important stop in Italian organs from the 17th century to the 19th. Composed of one or two mildly voiced Principale ranks tuned to undulate gently, it was usually of treble compass only, and intended for use with the Principale 8′, especially in the playing of music for the Elevation.

Vogelgesang, *Kuckuck*, *Nachtigall* (Ger.; It., *rusignolo*, *uccelli*; Fr. *rossignol*). National names for the bird-imitating toy stops popular from at least 1450 to 1800 and again in theatre organs from about 1925. Each builder had his own way of planning such quasi-automata; if the tiny pipes were suspended in water, the twittering was thought to resemble a nightingale; if two were involved and stood a 3rd apart, a cuckoo resulted; if air supply allowed it (and often so much air

was taken that no other stops could be drawn), moving statuary might complete the picture; and so on. An important example was the 'Vogelgesang durchs ganze pedal' (Praetorius) which was not a toy stop so much as either a tiny high Mixture of indeterminate pitch adding a soft glitter, or a regular, high Flute stop. *See* BIRD INSTRUMENTS.

Voix céleste (Fr.). A term apparently dating from the 1840s to denote a long-familiar effect achieved in the same way as Unda maris and Piffaro. Narrow-scaled pipes are usual for such stops from the late 19th century onwards.

Vox angelica (Lat.). (1) Small reed stops of 2′ found in the organs of some German builders *c*1750 (Stumm).

(2) Soft, small-scaled, 8′ flue stops on various 19th-century organ-types, including Italian ones.

(3) A free-reed stop used by Walcker and other 19th-century German builders.

Vox humana (Lat.; Fr. *voix humaine*; Sp. *voz humana*). The name for numerous stops whose common characteristic is the claim to imitate the human voice, particularly its thin, undulating quality, and always at 8′. (1) The Renaissance Voce umana was the same as Piffaro. See also under *Piffaro* and *Voce umana*.

(2) Some 16th-century builders used the term for a registration (e.g. Regal + Nasard + Larigot) or for the Regal 'helping to make the Vox humana effect'.

(3) Many Regal types during the 17th and 18th centuries were invented for the purpose, with resonators open, closed; of brass, hardwood; short, half-stopped, cylindrical, capped and pierced, double conical, bulbous, etc. Some had their own tremulant.

(4) During the late 19th century and the early 20th the standard Vox humana was a quarter length cylindrical reed, sometimes enclosed in its own expression box.

Waldflöte (Ger.). A 'forest flute' stop. (1) A wide-scaled, conical, metal Flute of 2′ (sometimes $2\frac{2}{3}$′ or $1\frac{1}{3}$′) in 17th-century German organs. Praetorius referred to open pipes, although instruments in Eastern European countries have stopped ones; most were wide-scaled.

(2) Open Flutes, of 8′ or 4′ pitch, in English and German and American organs of the 19th century, sometimes metal but usually wood.

Zimbel (Ger.; Eng. *Cimball*, *Cymbal*; Fr. *cymbale*; Sp. *cimbala*, *zimbala*; Port. *resimbala*). The high chorus Mixture separated from the basic Mixture as the *Blockwerk* became divided; in many cases the same as Scharf. (1) Some early Zimbeln contained a Tierce (Terzzimbel), *c*1450–1550 or later, Praetorius recommending such high Mixtures (15.17.19).

(2) The classical French Cymbale was a high Mixture of octaves and 5ths, the ranks breaking twice per octave (*cymbalisée*) (compare with *Fourniture*).

(3) The 'repeating Zimbel' was a single-rank or compound stop repeating the same pitches in every octave, *c*1600–1750 in Germany, perhaps in reference to the medieval cymbala or small, tuned bells. This type of Zimbel was a colour stop, rather than a chorus stop.

Zimbelstern (Ger.). A very common toy stop, found mostly in northern Europe *c*1490–1790 but occasionally elsewhere, and consisting of a revolving star placed towards the top of an organ case to whose wind-blown driving-wheel behind the case is attached a set of bells, tuned or (before *c*1700) untuned. Mattheson (1713) thought the effect good for feast days.

Zink (Ger.). Like Cornet, Zink denotes an imitative stop achieving a cornett-like tone either with reed pipes or as a compound flue stop. (1) A Tierce Mixture of the latter type in some early 16th-century contracts.

(2) A reed or Regal stop in others of the same period; later, 'Zinken oder Cornett' was normally a reed stop of the Schalmei kind, particularly a pedal 2′ reed stop useful for cantus firmus melodies in Lutheran Germany.

Organum (Lat., from Gk. *organon*: 'instrument', 'implement', 'tool'). A type of medieval polyphony. Early meanings are connected with the organ, but later only with 'consonant music'. While retaining the collective meaning of 'polyphony' in general, from the 12th century it was used specifically to refer to music with a sustained-note tenor (usually a pre-existing part) and more mobile upper part or parts.

1. ETYMOLOGY, EARLY USAGE. The Greek word 'organon' ('tool', 'means', 'organ of the body') was also used for musical instruments, and for the various organs of speech of the human voice. Its first known usage specifically as 'organ' in the musical sense occurred in the first half of the 5th century CE in a commentary on the psalms by Hesychios of Jerusalem (*PG*, xxvii, 1341C). The Latin word 'organum' on the other hand was current in the restricted sense of 'organ' as early as *c*400 according to St Augustine, and this was its 'true' Latin meaning (Psalm commentary: *PL*, xxxvii, 1964). In Latin the primary word for 'musical instrument' in the general sense since classical times had been 'instrumentum'.

In the biblical allegories of the church fathers the musical instruments referred to in the Bible were interpreted as 'inner' (i.e. vocal) instruments because the use of instruments in Christian worship was forbidden. The word 'organum' was also taken over and applied to that which was produced by instruments, and produced in particular by the human voice. Thereafter it was used not only for forms of verbal discourse (equivalent to 'sermo',

'praedicatio' and 'evangelium'), but also for a song of spiritual praise (as a synonym for 'canticum' and 'laus'), often in phrases such as 'in hymnis et organis'. This usage persisted into the late Middle Ages, particularly in religious poetry. Consequently, there is no compelling reason for treating references to 'organa' or 'cantica organica' in the texts of sequences and tropes as allusions to instrumental performance or to polyphony. In the late 13th century the theorist Anonymus 4 attested to the usage of 'organum' still for monophonic song, generally sacred ('Quandoque simplex organum dicitur ut in simplicibus conductis'; ed. Reckow, i, p.70).

From the 9th century onwards the word existed as a technical term in the theory of polyphony. It came to be used equally for a 'voice' which was added to a pre-existent chant melody (*vox principalis*), or for a single note within such a voice (both of which were termed *vox organalis*), and also for the polyphonic fabric as a whole.

Scholars have drawn many analogies between early polyphony and musical instruments, their construction or manner of playing. It is to these analogies that the choice of the word 'organum' in the early Middle Ages has until recently generally been attributed. They have included the analogy between parallel movement of voices and the mixture rank of the organ (Husmann); between long-held notes and an instrumental drone (Waeltner); between the accompanimental role of the *vox organalis* with regard to the *vox principalis* and the accompanimental role of instruments with regard to singing; or between instrumental embellishment (which by its nature was wordless) and the melismatic vocal decoration which occurred in the *vox organalis*, especially after about 1100 (Eggebrecht). Other inferences from the term 'organum' have been that polyphony was instrumental in origin (Georgiades) and that it was intended for purely instrumental performance (Krüger).

Assumptions such as these may go some way to accounting for particular characteristics in early polyphony. At the same time, nowhere do they receive support in the literature of music theory itself as statements about terminology. The sole indication of a possible connection between musical instruments and terminology for polyphony occurs, in about 1100, in a vague attempt at etymological definition by Johannes Cotto ('Affligemensis'), of which the Latin reads: 'Qui canendi modus vulgariter organum dicitur, eo quod vox humana apte dissonans similitudinem exprimat instrumenti quod "organum" vocatur' ('A manner of singing commonly called "organum", because the human voice, aptly dissonant, bears a likeness to an instrument which is called "organum"': CSM, i, p.157). And this explanation, significantly, is ignored, even contradicted, by later theory.

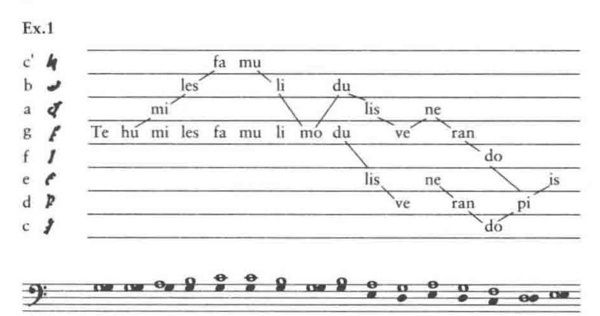
On the other hand, a number of passages in early polyphonic theory can be taken to imply that the term 'organum' refers to the consonant relationship between *vox principalis* and *vox organalis*. Therefore, in the central theoretical source, entitled *Musica enchiriadis* and dating from the second half of the 9th century, the *vox organalis* is also called the *cantilena simphoniaca* (ed. Schmid, p.48). This interpretation finds its strongest support, however, in a number of observations in the theoretical literature – all admittedly rather elliptical – on vertical sonority. In the Cologne organum treatise (*c*900), notes in the *vox organalis* that form a 3rd or 2nd with the *vox principalis* are ranked as 'abusivum organum' (ed. Waeltner, p.54). The author of the Paris organum treatise (10th century) went so far as to say that with such vertical sonorities *legitimum organum* 'falls silent', or that *responsum organi* 'is lacking' (ed. Waeltner, p.76). This does not mean that the creation of these sonorities is itself 'improper' or impossible – they are indeed expressly taught and demonstrated. It should be taken as conveying rather that such effects would be designated improper (i.e. contrary to proper word-usage) only as organum; in other words, that such (in themselves entirely legitimate) sonorities are not organum in the strict sense of the term. Logically then, the term 'organum' must at first have been reserved exclusively for consonant sonorities. Indeed, in the definitions of organum that occur in music theory up to the 12th century only 4ths and 5ths are mentioned as constituent intervals.

This conception of organum seems to be associated with a specialized use, current from late classical times, of the adjective *organicus*. It comes through particularly clearly in expressions such as 'organicum melos' and, from the early Middle Ages onwards, 'instrumentum organicum'. An *organicum melos* is a *melos* the pitches of which – whether monophonic or polyphonic, vocal or instrumental – are precisely measured. (It is in this sense, and not as evidence of polyphony, that a famous passage by John Scotus Erigena should be interpreted – see *NOHM*, ii, 1954, p.273.)

By analogy, an *instrumentum organicum* is a musical instrument which by virtue of its construction is capable of being exactly tuned, and thus lends itself to theoretical demonstration. Its pitches, each represented by one or more pipes, strings, keys or bells, exist in a consonant relationship to one another – as a result of the circle of 5ths, which forms the basis of tuning.

This conception of *organicus* probably derives from the Greek *kataskeuē organikē* of geometric construction. The organa in geometry were compasses and straight-edges which, in contrast to stencils with their imprecision, were considered scientifically reliable. It was on these grounds that the Greek adjective *organikos* had come to be used also in the abstract sense of 'mathematically exact' and 'theoretically sound' in geometrical theory as early as late classical times. The organa that lie behind the early medieval polyphonic term were thus in the last analysis not musical instruments at all: they were compasses and straight-edges as the guarantors of quadrivial order and exactitude. The term 'organum' can itself probably be seen as defining a prior condition for polyphony. This condition refers to the exact measurement of pitch which is so essential to the fitting together of parts, and at the same time expresses verbally the fact that consonance itself comes to audible reality as the 'temperamentum modulationis' (Isidore of Seville, *Etymologiae*, iii, 20.3).

In the early medieval sources the word 'diaphonia' was also used, along with 'organum', to designate polyphony. This word is not to be taken as signifying dissonance. Much more likely, it conveyed – as did its successor 'discantus' from the 12th century onwards – the striking effect of 'sounding apart', in contrast to the 'uniformis canor' of a monophonic melody.



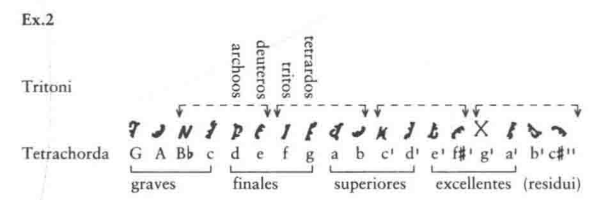
The term 'discantus' from the 12th century onwards stood, as a general rule, for note-against-note counterpoint. The term 'organum' itself did continue as a collective word for all types of polyphony (*organum generale*); but at the same time it took on a special

meaning in the 12th century as the new type of sustained-note counterpoint – a type that was at first for two voices, and in which a melismatic upper voice was constructed above long-held plainchant notes (*organum in speciali*; see §6 below). From the latter part of the 13th century, 'organum' came to be used to describe plainchant setting in general (above all that of the Notre Dame composers), in contradistinction to the categories of motet and conductus.

2. 9TH-CENTURY THEORY. The concordant intervals were an essential element in early polyphony. This is clear from the way in which polyphonic treatment was at first frequently discussed under headings such as 'De symphoniis'. The technique of polyphony was based on two practices, both of them probably very old: that of parallel singing in concordant intervals, and that of the use of a drone. At any rate, regular instruction in the form of a systematic course of teaching had become a necessity at just about the time when performance in pure and unornamented parallel motion, and performance using a drone, were on the decline. This decline took the form of a combination of the two practices. In it the new elements of polyphony since the 9th century had their origin – and not only in the decline itself, but also in the way in which musical theorists presented and accounted for it. For only now could the *vox organalis* be thought of as an increasingly independent moving 'voice'; only now did alternative ways of singing polyphonically become thinkable and feasible; only now could different ways of shaping a counterpoint be tried out in practice and formulated as theory, and hence the 'history' of polyphony really begin. And it was a history at whose beginning there was very little by way of prescriptive theoretical writing. Nevertheless, by about 1100 a measure of freedom had been achieved in the fashioning of counterpoint. Music theory could do little more than give a general idea of this, in the form of contrived examples; and in turn, from the 13th century onwards there are specific references to individual compositions which the reader is expected to have in his mind as models. These, apart from elementary rules of part-writing, take the place of the examples and now serve to stimulate or to corroborate what has been said.

In the organum of the early Middle Ages the *vox organalis* generally lies beneath the *vox principalis* (ex.1; *see also* SCORE, fig.1). The latter, as the melody pre-existing in its own right, placed as it is in the prominent register, is still heard as the primary voice. Organum theory begins with performance in either parallel 5ths or parallel 4ths. Free interchange between these two intervals

Ex.1



o = vox principalis (cantus) • = vox organalis

was not expressly permitted until about 1100. In even the earliest sources the 4th was favoured. This must have been partly because it was the concordant interval which would most perceptibly have the effect of 'sounding apart', and partly because the two voices were then closer together and could most easily converge on to a unison. The Daseian notation used in *Musica enchiriadis* was, as will be seen later, obviously designed with organum at the 4th in mind.

In the discussion of organum in *Musica enchiriadis* a crucial role is played by the tritone. It is the tritone's *inconsonantia* or *absonia* which makes deviation from strict parallel movement necessary. It is that also which brings about a change in texture to one in which the *vox organalis* often clings to a particular note and produces a drone-like effect. Since the writer of *Musica enchiriadis* was clearly very concerned with such deviations, he found that a system of disjunct tetrachords offered the means whereby the occurrence of tritone intervals in organum at the 4th – and the need for avoidance – could by comparison with the normal octave system be doubled. This system was built of identical tetrachords grouping themselves around the tetrachord of the finals D, E, F and G (ex.2:

Ex.2

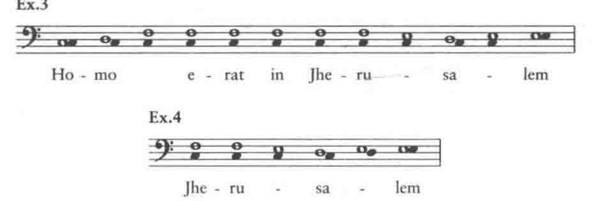
note the brackets under the letter names; the four degrees of the main tetrachord appear with their Greek number names *archoos*, *deuteros*, *tritos* and *tetrardos*). Adjacent tetrachords were always separated by a whole tone – hence they were disjunct. Because of this they cut across the octave structure of the normal tonal system; the pattern of intervals repeats at the 5th rather than at the octave. Thus it is possible to sing in parallel 5ths in this system without disturbance. A critical factor was, however, that when singing in 4ths a tritone now occurred on every fourth degree of the scale, between the *tritos* of one tetrachord and *deuteros* of the next tetrachord up: *B♭–e*, *f–b*, *c'–f♯'*, *g'–c♯''* (see ex.2, the brackets above the letter names). By contrast, the tritone in the octave system arises only between *B♭* and *e*, and between *f* and *b*. Each of the four degrees of the tetrachord has its own sign, and this sign is modified with its reappearance in each higher tetrachord by being reversed, inverted and reverted respectively – the sign for the *tritos* being slightly modified in shape also. The practice of changing a sign by turning it round is reminiscent of Greek instrumental notation and is possibly directly influenced by that. The signs themselves were named Daseia signs after their basic sign, which was the Greek for the *prosodia daseia* (cf Schmid, pp.5–7).

If the teaching of *Musica enchiriadis* is followed, organum takes shape as a result of the joint operation of the tetrachord system and the law prohibiting the tritone. In order to avoid each tritone the *vox organalis* must constantly avoid the *sonus tritus*. To cope with this there is one prime rule: the *vox organalis* must not, in the course of a phrase, descend beyond the *sonus tetrardus*; nor, where the *vox principalis* begins a melodic ascent, must the *vox organalis* approach the *tetrardus* from below

(cf Schmid, p.49: 'ut in quolibet tetrachordo in qualibet particula nec infra tetrardum sonum descendat positione nec inchoatione levetur obstante triti soni inconsonantia, qui tetrardo est subsecundus'). The *vox organalis* is only allowed to 'stray' into the register of a neighbouring tetrachord if the *vox principalis* changes its register correspondingly (ed. Schmid, pp.51–2; cf ex.1: from the syllable -lis onwards the *vox organalis* shifts into the next tetrachord down). In practice each *sonus tetrardus* (*c*, *g*, *d′*, *a′*) functions as a lower limit of pitch to which the *vox organalis* clings like a drone. The *vox organalis* quits this limit in the upward direction only if the *vox principalis* itself moves beyond a 4th above it, or if the *vox organalis* moves to a unison with the *vox principalis* at the end of a section (the latter, as the pre-existing and hence unchangeable melody, thus drawing the *vox organalis* towards it, as it were). The second of these situations arises in ex.1 at the syllables pi-is; the first does not occur until after the dip down into the tetrachord below at the syllable -lis, the *vox organalis* therefore having to cling to the same *tetrardus* for the first nine syllables.

Put negatively, this way of shaping the end of a section, which applies analogously also to the beginning of a section (e.g. the unison opening of ex.1), suggests that a section was supposed never to end on a non-consonant interval. (Without the convergence of voices (*convenire*) ex.1 would have ended on a 3rd.) This is indeed the argument of *Musica enchiriadis*: it is because the *vox organalis* must not go below the *sonus tetrardus*, and because at the same time a section must not end on a 4th, that a unison is selected (ed. Schmid, p.50: '[vox organalis] subtus eundem [tetrardum] non valet positione progredi et ob hoc in finalitate positionum a voce principali occupetur, ut ambae in unum conveniant'). Admittedly examples do also occur in *Musica enchiriadis* in which the *vox organalis* does go below the *sonus tetrardus* and ends on a 4th. But such cases were probably counted as transitional – in accordance with the methodical way of setting out organum theory – though not in fact forbidden (ed. Schmid, pp.36ff). Put positively, this way of ending sections manifests a very strong desire to point up by musical means the structure and phrasing of chants that are to be sung polyphonically. The *vox organalis* is in truth no more than an 'ornament', but it is a great deal more than a mere 'doubling' of the chant. It creates sonorous tension by 'singing apart', heightens this tension by changing the vertical intervals, and dissolves the tension at each of the caesuras as it establishes a point of rest in the sonority.

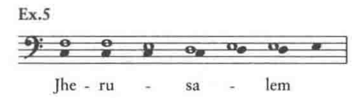
3. 10TH- AND 11TH-CENTURY THEORY. The teaching in *Musica enchiriadis* is characterized by the search for a thoroughly 'automatic' process in polyphonic performance. Thanks to the particular nature of the tetrachord system, organum arose more or less of its own accord so long as certain rules and constraints were consistently observed (the only entirely optional factors were the doubling or tripling of both voices at the octave, and their reinforcement by instruments: cf Schmid, pp.38–40). The performers were not directly answerable for the musical effect; nor would they find in this treatise the necessary aesthetic grounding. It was thus possible to perform a *vox organalis* extempore at any time and to any chant for which it might be desired, after agreement on only a very small number of technical points. Moreeover, the greatest possible uniformity was automatically guaranteed for the polyphonic end product. This very disregard of aesthetic considerations, and of evaluation, saved polyphonic practice from having to think in terms of alternatives, improvements or refinements. The teaching in *Musica enchiriadis* must surely be conceived in so cryptically codified a fashion precisely because the uniformity of liturgical chant had to be preserved even in polyphonic performance – that wholesale uniformity which had been a prime goal of all reforms in church music ever since Pépin and Charlemagne. This suggestion is supported by the extraordinarily wide distribution of the treatise, for it survives today in more than 40 manuscripts.



However, the future lay in a type of polyphonic teaching that emerged for the first time in the Cologne organum treatise of about 900. This type of teaching gradually began to spread in influence from the time of Guido of Arezzo's *Micrologus* (early 11th century). This is a method of teaching that, while firmly based on *Musica enchiriadis* in its subject matter, differs strikingly in its manner of presentation and argument. Its starting-point was still a set of definitive rules, but now in addition it allowed for 'exceptions'. In matters of detail it was content to lay down guidelines. It relied on the singers' experience and judgment; by means of aesthetic argument it strove to analyse current practices, to experiment and develop new methods. The theory of polyphony thus became something like an introduction to the subject, describing possible ways of creating polyphony, and putting forward rules but never expecting blind observance.

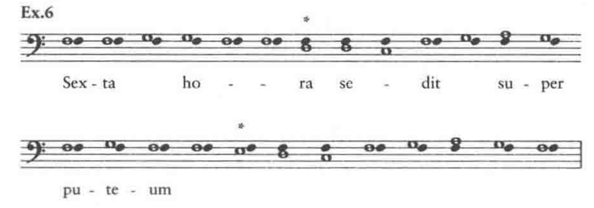
The abstract tetrachord system was abandoned along with Daseian notation. The Cologne organum treatise no longer used Daseian notation; Guido criticized the 'moderns' openly for having introduced these innovations very carelessly, and at the same time disregarded the early theorists' recognition of the octave as the only interval that makes perfect consonance ('perfecte consonat') rather than the 5th (CSM, iv, pp.112–3). The pitching of the *vox organalis* a 4th lower than the *vox principalis*, and also its parallel movement, were retained in essence, as was the principle of pitch limits that the *vox organalis* must not overstep. Indeed, these were now positively reasserted. The *vox organalis* no longer had to converge to unison ('in unum convenire') with the *vox principalis* as a matter of necessity just because an artificially produced tritone stood in the way. Rather the contrary: so that the two melody lines 'can come together in a suitable manner' at the end of the line – and this is the crux of the matter – the pitch limits should be obeyed merely as rules of thumb ('ut in finalitatibus vox ad vocem apte convenire possit ..., organum inferius descendere non possit': Cologne organum treatise, ed. Waeltner, p.54).

The determination of the pitch limits was governed by the tonality of the chant. However, their deployment now became transparently clear on aesthetic grounds also. According to Guido, the whole tone and major 3rd (together with the 4th and unison) were the favoured sonorities. The minor 3rd on the other hand was no more than tolerated, the semitone not accepted at all. For this reason the bottom notes of the hexachords, C, F and G, with the particular pattern of intervals that surrounds them, turn out to be the ideal pitch limits, because all the favoured sonorities could be sounded above them ('Aptissime vero, qui saepissime suaviusque id faciunt, ut tetrardus et tritus in .C. et .F. et .G. Haec enim tono et



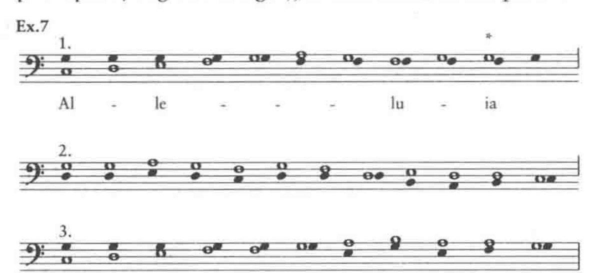
ditono et diatessaron obsequuntur': CSM, iv, p.202). The tritone that arises in Guido's system, between F and B natural, was avoided quite pragmatically by shifting the *vox organalis* on to G to produce a major 3rd (CSM, iv, p.206).

Guido went significantly beyond *Musica enchiriadis* in his refining of the way in which cadences were formed. He also for the first time allowed brief crossing of parts. The *vox organalis* was no longer simply 'occupied' at the close by the chant (cf Schmid, p.50) but could now 'come to meet' it in what was called the *occursus* (literally 'meeting'). Guido viewed the two voices as approaching each other by step, so that they could converge on to unison as far as possible *e vicino* ('from nearby': CSM, iv, p.204). He demonstrated this by means of two examples, significantly presented together as alternative and equally acceptable possibilities (exx.3 and 4). In accordance with

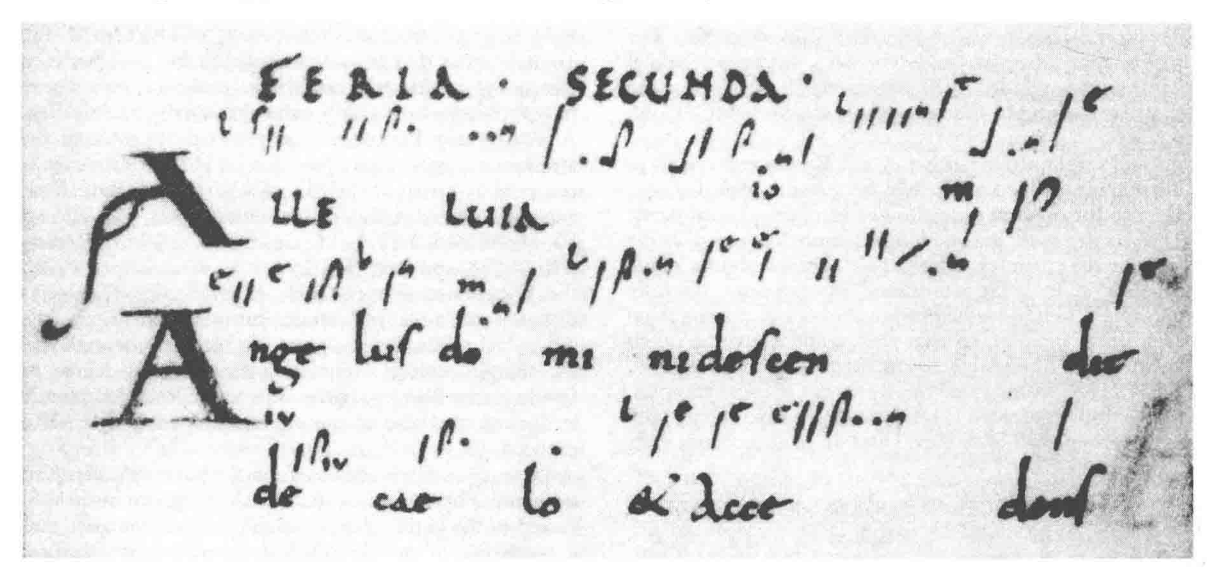


traditional practice, the *vox organalis* in ex.3 (CSM, iv, p.211) clings to the lower pitch limit right through to the penultimate note on the grounds that its distance from the chant is less than a 4th. This is called *occursus simplex*. Following the new practice, the interval of the major 3rd *c–e* in ex.4 is passed over by step in the *vox organalis* via a penultimate *d*. This is called *occursus per intermissas* [*voces*].

When convergence by step in this way is not possible, it is preferable for a phrase to close on a 4th rather than converge on to a unison by leap in the *vox organalis* (CSM, iv, p.204). This does not apply, however, when the phrase concerned is the last of the whole piece. The progression towards a close may be further refined by a kind of cadential extension of the chant, this being also optional. Against the last note of the chant there occur two notes in the *vox organalis*, the first being a 2nd below – thus in effect prolonging the penultimate note – and the second note providing a resolution on to the unison (CSM, iv, p.205: 'Item cum occursus fit tono, diutinus fit tenor finis, ut ei et partim subsequatur et partim concinatur') (ex.5, based on exx.3 and 4).



The rule that the *vox organalis* must lie always beneath the chant was also first modified by Guido: if the chant went only briefly below the lower pitch limit (Guido demonstrated it with a limit of *f*) then the organum voice could remain unchanged. This was called *organum suspensum* (CSM, iv, pp.205, 212) (ex.6, at the asterisk).

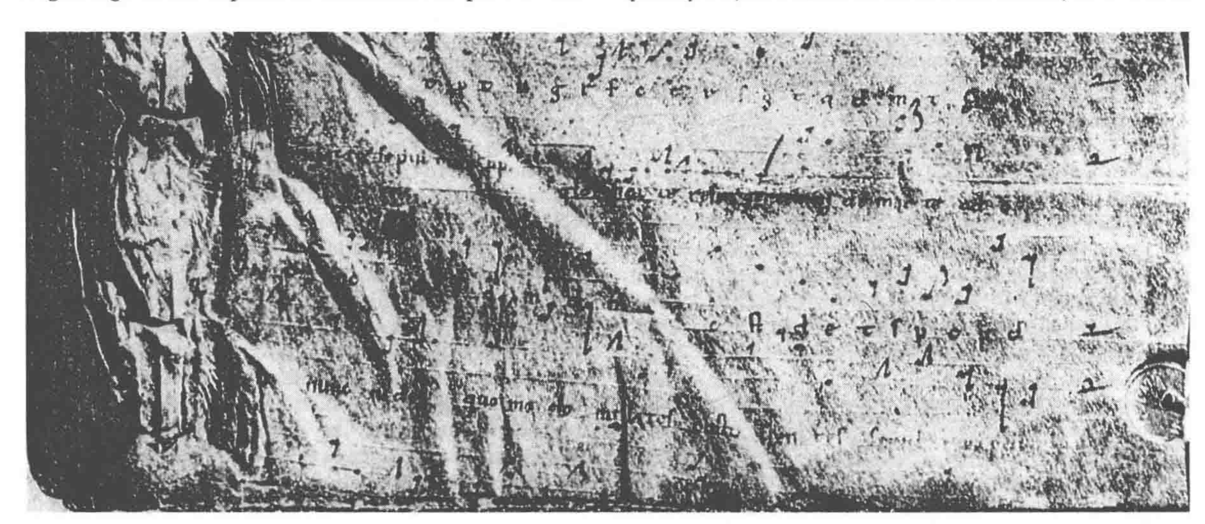


4. Practical sources: changes of style about 1100.
To the extent that there were now alternatives between which the performers could freely choose, extempore polyphonic performance became that much more difficult. A way of relieving the difficulty was to fix some of the alternatives in written-down form. The earliest known practical sources of polyphony do in fact date from around the time of Guido (*see* Sources, ms, §§IV, 2 and VI; also RISM, B/IV/1, M. Gushee (E(iii)1963), Rankin (H(i)1993), and Arlt (H(i)1993). In what is now called the Winchester Troper (early 11th century) numerous different versions of certain turns of phrase in the individual *vox organalis* parts are recorded expressly in the margin: this is some indication of the degree of freedom that had been gained meanwhile in polyphonic treatment, and also of the interest that each alternative aroused.

The early written sources are unfortunately difficult to decipher. They evidently assume the singer to be so well versed in the basic rules of polyphonic performance that a rendering in mostly staffless neumes would suffice. (Scribes did occasionally later in the Middle Ages resort to letter notation again; when they did so it was precisely in order to counter difficulties of reading that might arise.) Despite the uncertainties of deciphering these notations, it is possible, even in the earliest of practical sources, to determine certain characteristics that go beyond the teaching of Guido; they help to put the compulsoriness of the traditional rules into perspective.

Ex.7, from *Alleluia, Angelus Domini* in the Winchester Troper (f.164*v*; Holschneider, p.110; the *vox organalis*, in a different part of the manuscript from the *vox principalis*, is given in fig.1), is traditional in the parallel

movement at the 4th below in its second phrase, and typically Guidonian in the close of its first phrase (at the asterisk). Similarly, the switch of lower pitch limit from *g* to *f* (first phrase) had already been authorized by Guido. By means of this switch the chant, which descends to *f*, does not have to cross the *vox organalis*; also, an *occursus* on to the final *g* is only possible via *f* (cf Guido's example, CSM, iv, p.213). Among the new features that occur in this piece are the formation by the *vox organalis* of a 5th above the *vox principalis* at the beginning of the first and third phrases (assuming the transcription to be reliable). Evidently the tessitura of the *vox organalis* is regulated by the prevailing final; even in a chant of wider range the drone effect – which was still obviously much liked – is partially retained (according to *Musica enchiriadis* the *vox organalis* ought, by analogy with the melodic movement of the chant, to begin in unison on *c*: cf ex.1). As a result, the notion of a lower pitch limit in the strict sense scarcely applies any longer, so habitually is it exceeded (see for example the *e* at the end of the third phrase). Moreover, according to the movement of the



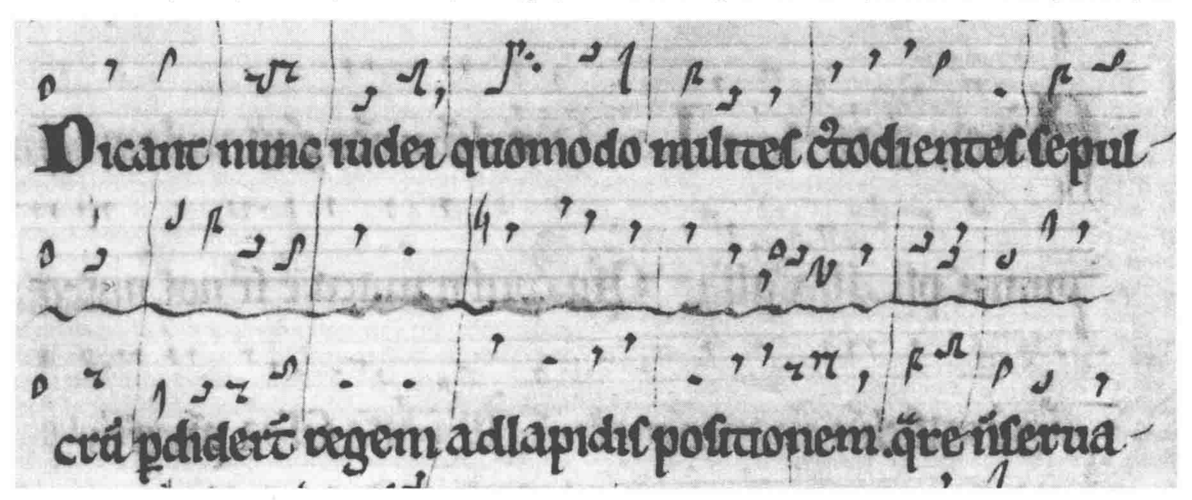
1. Vox organalis for 'Alleluia, Angelus Domini' from the Winchester Troper, early 11th century (GB-Ccc 473, f.164v; from A. Holschneider: 'Die Organa von Winchester', 1968)

chant, other notes, besides *c*, *f* or *g*, appear as organal holding-notes (as one might call them to distinguish them from the lower pitch limit, and also from the long-sustained notes of organum from the 12th century onwards): see for example the *d* in the second phrase of ex.7.

The principal requirements for the formulation of a 'new organum' about 1100 were by now fulfilled. Parallel movement and holding-notes were now so loosely applied that they could readily be replaced by a completely free use of intervals, including a free interchange between 4th and 5th. The 4th, which was for Guido the widest distance of 'singing apart', had evidently already been exceeded, and the two parts crossed as often as it seemed melodically or harmonically sensible for them to do so. In the light of Guido's teaching on *occursus* the principle of contrary motion gradually emerged and took on significance; and in his extending of cadences there lay already the beginnings of an impulse to ornament the penultimate note, which after about 1100 became melismatic in character.

The new style of organum is evident as early as the latter part of the 11th century in one of the three Chartres fragments (*F-CHRm* 109). This fragment contains five two-voice pieces which can be accurately transcribed because they are notated on staff lines (fig.2 and ex.8, upper line). The principle of holding-notes is here completely abandoned. Even simple repetition of a note is avoided in the *vox organalis*, with the result that there is very little difference of melodic character between the two voices. With the exception of several parallel 3rds, which always converge onto a unison and function like a prolonged *occursus* (phrases 1–2, 5 and 7), contrary motion is prevalent, with the voices extending to a 6th apart (phrases 3 and 4) and occasionally as far as an octave apart (phrases 4 and 8). The *vox organalis* still tends, as in traditional practice, to lie below the *vox principalis*; but the two do nonetheless cross, as is natural

2. Beginning of the verse 'Dicant nunc iudei', in two-voice organum, from the processional antiphon 'Christe resurgens' in a MS from Chartres, second half of the 11th century (F-CHRm 109, f.75r; from PalMus, 1st ser., xvii, 1958)



when contrary motion is in force. In general the two voices seem to centre their movement on the final *d*. Caesuras (taken here as the points at which the two voices converge to unison, and in later sources as marked also by vertical strokes) occur not merely at each genuine *distinctio* in the chant but in practice at the end of each word of text. The price of emancipation from parallel movement and from drone effects is first and foremost sectionalization into small phrase units – the breaking-up of the chant into short harmonic progressions. The fact that almost all these progressions end on the final *d* means that the piece is, from the tonal point of view, remarkably homogeneous.

It is historically interesting to note that a second version of this piece has survived. It appears in a manuscript from the latter part of the 12th century, now in Oxford (*GB-Ob* Rawl.*c*.892, f.67*v*; see ex.8, lower line, and fig.3). The piece as it survives in Chartres 109 is evidently already a distinctive enough product to be worthy of preservation. For it is hard to imagine how, considering the great range of possibilities that had meanwhile evolved in polyphonic treatment, the two versions could so closely correspond simply by the application of analogous rules.

At the same time there are differences of detail that indicate that the first version was not thought to be absolutely definitive. Complete definitiveness is not found before the compositions of the Notre Dame repertory in the late 12th century: a repertory within which fixity had become a goal towards which composers might rightfully strive. In the first and sixth phrases there appear interchangeably an archaic initial 4th and a modern unison. Where Chartres lets the counterpoint expand to the octave Oxford on one occasion presents only a 5th, clearly preferring conjunct melodic movement (phrase 4, at the asterisk). Also, the author of the Oxford version is more concerned with contrary motion where Chartres has parallel 3rds. As the interchangeability of 4th and unison at the beginnings of phrases shows, the two versions were probably not far apart in time, despite certain differences. Rather, they are as the imprinting of two divergent stylistic tendencies upon the common basis of an established polyphonic solution.

5. Organum and liturgical chant. The examples cited by polyphonic theorists up to Guido are drawn from the *Te Deum* and also from the sequence, hymn and antiphon. Scholars have often concluded from this that early medieval polyphony was a practice that 'stood outside the official Roman liturgy and its Gregorian chant' (Stäblein, *IMSCR IX: Salzburg 1964*, ii, p.72). At first, supposedly in recognition of the 'inviolability of liturgical chant', it was performed only 'where the liturgy allowed a certain freedom' (Waesberghe, *AMw*, xxvi, 1969, p.264). Also its terminology is said not to include 'the names of Gregorian chant types', but rather 'unaccustomed terms' such as 'canticum', 'carmen' and 'cantio'.

In reality, nowhere in theoretical literature, or indeed in any other relevant writings of the time, is an express distinction to be found between more and less 'inviolable' chants. The most that occurs is reprimand for deviations from liturgical conformity. Even this occurs primarily on

3. Beginning of the verse 'Dicant nunc iudei', in two-voice organum, from the processional antiphon 'Christe resurgens' in a gradual from Downpatrick, second half of the 12th century (GB-Ob Rawl.c.892, f.67v)

political grounds. What is more, it is very difficult to conclude from the terminology of early medieval polyphonic theory that 'official' plainchant was excluded from polyphonic treatment. If theorists were to deal not with individual chant types but with the various chants of the liturgy in general ('ecclesiastica cantica', 'sacra cantica', 'ecclesiastica carmina', etc.), it was only logical that they should use correspondingly general terms. For Gregorian chant itself, for instance, 'carmen gregorianum' was a current overall expression (see *MGG1*, Stäblein: 'Choral', §1).

More conclusively still, as early as the first half of the 11th century, in the very earliest surviving practical sources of polyphony, categories of Gregorian chant are included that can in no sense be called 'extra-liturgical' or even 'half-liturgical'. There is no evidence that in the earlier time of *Musica enchiriadis* any other standards, liturgical or ideological, would have applied in polyphonic practice. The problem comes down in the end to the choice of examples in early polyphonic theory. And for this purely pragmatic reasons can be adduced.
